Ice Spring Craters.

The historic Lake Bonneville, which was the largest of the lakes of the Great Basin, was fed chiefly by the snows of the Wasatch and Uintah mountains. Its catchment basin embraced about five degrees of latitude and three of longitude, containing about 54,000 square miles, or the fourth part of the area of the Great Basin. This region of Utah has been made a subject of special study of late years by the U. S. Geological Survey, and many facts of great scientific interest have been developed.

Of the various volcanic districts of Utah, that which is the most interesting in this connection occupies the eastern portion of the Sevier Desert in the vicinity of the towns of Holden, Fillmore, Corn Creek, Kemosh and Deseret. Nearest to Fillmore is the Ice Spring lava field, with its cluster of craters. The lavas of this locality are the most recent within the Bonneville area, and their phenomena are typical of sub-aerial eruptions. The craters are grouped closely together. There have been at least twelve successive eruptions through as many independent vents within a radius of 1500 feet, and none of these eruptions appears to have been large.

One of the largest of the Scoria hills is the Crescent, shown in the accompanying engravings. It is a crater fragment showing nearly one-half of the original circle. It rises 250 feet above the eastern base, and the entire crater appears to have had a diameter of 2200 feet. One end of the Crescent is buried

ICE SPRING CRATERS; THE CRESCENT AS SEEN FROM THE MITER.

CRESCENT.

MITER.

TERRACE.

ICE SPRING CRATERS; BIRD'S-EYE VIEW FROM THE WEST.

beneath a lava crater, the Miter. The other is cut off by a stream of lava flowing from the same.

The Miter, also shown in the engraving, is perhaps the most recent of the craters. Its rim is nearly circular, with a diameter of 950 feet. Its highest side, on the east, rises 275 feet above the central depression. Its history has involved at least two overflows. After it had reached about its present size, the lava rose within it, breached its north side, and discharged.

The discharge was followed by explosive eruptions and the breach was repaired.

Between the Miter and the Crescent, stands a low cone resembling the Miter in form, but only 400 feet in diameter.

The Terrace crater lies just south of the Miter, with an irregular outline and an extreme length of 1100 feet; width, 700 feet. The depth of the crater below its general rim is 260 feet.

The name of the Ice Spring lava beds is derived from what may be regarded as a natural ice-house, existing in one of the deeper hollows of the fields. It is in a natural pit among the lava blocks, and so sheltered by an overhanging ledge that it never receives the direct rays of the sun.

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XXIV.

[Written for the Press by JAMES H. CROSSMAN.]

Providence Mining District.

Situated on Providence Mountain, has been subdivided, and is now known respectively as the Trojan, the Gold Belt and the Arrow Mining Districts.

Providence Mountain has been previously described in article No. 5 of this series. That portion of the range known as Providence Mountain contains a longitudinal extent of about 20 miles, and is composed of many varieties of rock. The hanging-wall of the mineral belt which courses N. 25 degrees east, through the easterly flanks of the main range, is a porphyritic granite. This mineralized belt is traceable for a distance of more than four miles, and contains 17 full locations of mining claims, with 12 others that are not on the belt proper, according to the District Recorder's book of records.

The Trojan District

Is the most important of the three. The Bonanza King's Mill & Mining Company's property consists of the Bonanza King, Bonanza King North, Orient and the Rattler. Its history in brief is as follows: In 1880 two prospectors from Ivanpah discovered the Bonanza King, and sold it to the noted mine operators and capitalists, Messrs. Osborne and Drew, who reopened the mine, proved its value, and in 1882 resold it to San Francisco and New York capitalists for the sum of \$200,000. Systematic work of development was commenced and a 10-stamp mill erected. From date of purchase to date of suspension in 1886, on account of the burning of the mill, the mine was in bonanza, having paid in dividends a sum in excess of \$200,000. Notwithstanding the large amount of ore in sight in the mine at that date, the owners decided, on account of the low price of silver then ruling, not to rebuild the mill, and their mine has lain idle since.

The developments in the Bonanza King proper consist of a main working shaft, 650 feet deep (vertical), with a network of drifts and crosscuts exposing large bodies of high-grade ore. The Orient and the Bonanza King North adjoin and have been developed and worked through the Bonanza King's main shaft. The buildings and surface improvements are on the Orient ground.

The old Cashier lies on the southerly extremity of the belt referred to. It is a well-defined vein showing spots of silver copper glance that assays from 100 to 400 ounces per ton. It is developed by two small shafts; the owner is L. Walcott.

The Trojan Mine

Contains surface deposits of low-grade ore in the form of segregated pockets or bunches varying from 1 to 50 tons each; ore values in silver, 40 ounces per ton. Notwithstanding the low grade of the ore and low price of silver, this mine has been profitably worked to a considerable extent. The owners are Turner & Dwyre.

The Mineral Point Mine

Has been developed by two levels which have each been extended into the mountain for a distance of 300 feet. The ore extracted has been assorted by hand picking and the better class shipped to Kingman and Ivanpah for sale and reduction. Ore values are from 150 to 500 ounces silver per ton. The second class is worth from 40 to 50 ounces per ton, which still remains on the dump; owners, J. B. Cook and others.

The Mozart

Has been developed by two short tunnels and two shafts, 50 and 90 feet respectively. The ore that has been stopped from the mine has been shipped to Kingman and yielded 150 ounces silver per ton. The owners are J. B. Cook and others.

The Luknow has been developed by an adit level 200 feet long, driven across the country rock into the lode; ore values 40 ounces per ton; the mine is owned by J. B. Cook and others.

The Red Leg has a shaft 40 feet deep on a 20-inch vein; assays run from 15 to 300 ounces per ton; owners, Gorman & Dwyre.

The Bell McGilvray mine is developed by a shaft 75 feet deep and one of 50 feet; also two tunnels respectively 150 and 300 feet in length. Of the ore extracted, 100 tons milled yielded 125 ounces silver per ton; 200 tons on the dump assay 60 ounces silver per ton. The owners are Gorman & Dwyre.

The Bonanza Prince and Bonanza Queen are adjoining claims—test shipments of average ore yielded 80 ounces silver per ton; owner, C. C. Quinn.

The Pitman mine has been developed by a 75-foot vertical shaft, sunk in the country to strike an inclined lode at a depth of 500 feet; crosscuts and levels are to be run each 100 feet. The vein on the surface shows a width of four feet of 75-ounce ore; owners, E. Hahn and others.

The Perseverance Company's property consists of the Perseverance mine, the Buster and Perseverance North. On the Perseverance the main working shaft has reached a vertical depth of 250 feet. The vein in the bottom is four feet wide. It is the intention of the owners to thoroughly develop the mine before mil-

ing any ore. A five stamp mill has been erected on the property, which is owned in Pennsylvania.

The General Custer is a gold mine developed by a shaft 30 feet deep. The grade of ore is \$20 per ton and the claim is owned by C. C. Quinn. The remaining locations on the belt have been but little developed and only enough work has been done to keep up the yearly assessments to hold the claim.

The Gold Belt Mining District, Segregated from the Providence district, is on the northerly flank of Providence mountain. The gold bearing rock lies in streaks, pockets and bands inclosed in a calcareous belt which forms the gangue of the vein. These mines have been but little developed—not enough to prove their extent or value.

The district was formed in 1886 and detached from the Providence on the discovery of its gold-bearing character by Messrs. Wett and Seidel. Of the many locations in this new district, the following are the best developed and the most prominent:

The Toughnut

Has been developed by two shafts, each 60 feet deep, from which considerable ore has been extracted and shipped for reduction, after having been hand-picked and assorted to values ranging from \$150 to \$200 per ton. The second-class ore that remains in sight in the mine and on the dump ranges in values from \$60 to \$80 per ton in gold. This appears to be about the average value of the ores in the mine, with rich pockets and bunches. The property is owned by Messrs. Wett & Domingo.

The Toughnut extension shows some good ore in the croppings, with but little work of development.

The Greyhound

Is situated on the dividing ridge, but included in the Gold Belt District. The product is silver, with values of 50 ounces per ton. It is developed by two tunnels of 100 feet each. The ore occurs in irregular streaks and bunches. The mine is owned by Wett & Domingo.

The Salazar mine is in the vicinity of the Toughnut. The vein is small and carries ore of both gold and silver. Selections have paid in mill \$100 per ton. The mine is owned by Salazar and Cordova. The Madison mine, in the same locality, has not been sufficiently developed to prove its value.

There occur in this district quite a number of springs of considerable strength, which are known as the Summit, Nos. 1, 2 and 3; the Cornfield, the Small Spring, and the Vorhago.

Arrow District

Forms the third subdivision of the old Providence District. It covers the entire southerly portion of the Providence Mountain range from east to west, and from north to south that portion that lies between the Vorhago pass on the north to the Granite pass on the south, embracing a considerable extent of country. This district was formed in 1878. Gold is the predominating metal.

The mine first located is known as the Domingo. It has been worked in a desultory manner by Mexicans to a depth of 40 feet. Arastras have been used for reducing the ore and extracting the metallic product. At that depth the ore became base and unfit for the arastra, and work was discontinued.

Other Prospects.

La Prieta was discovered in 1885. This mine has been developed by a number of small shafts, the deepest being 50 feet; vein 12 inches; ore assorted to values of \$135 and shipped to reduction works. The owner is J. N. Domingo.

The Golden Queen has a shaft 60 feet deep; adit 40 feet; vein 10 inches; ore values \$90 per ton. Joyce & Kean are the owners.

The Hidden Hill mine has but little work of developments. The owner is P. N. Kean.

The Tip Top is developed by pits 40 feet in length and open cuts carrying 12 feet of backs. The ore from this mine has been packed nine miles to water and worked in arastras, yielding an average of \$50 per ton. The owner is Richard Gorman.

The Red Cloud has a vein from two to three feet thick. The ores range in value from \$8 to \$20 per ton. Owner, P. N. Kean.

The Pass mine is a small vein running from \$8 to \$50 per ton in gold. Owner, Richard Gorman.

Northerly and westerly from our standpoint, an extensive elevated mountain range is seen, its lava-capped summit forming a table-land apparently without a break as far as the eye can reach. Easterly, a broad and extensive valley lies at our feet, through which passes the Atlantic & Pacific railroad. The valley shows every evidence of intense volcanic activity at no remote period, geologically speaking. Mud cones of greater or less dimensions dot the plain. We descend into the valley easterly and at a distance of 20 miles reach Fenner Station on the A. & P. R. R., where we are hospitably entertained by Messrs. D. O. Earle & Co. and genial "Bob" Hunter.

(To be Continued)

It is announced that the first of Pennington's air ships, built for the Mount Carmel Aeronautic Navigation Company, will start about January 1st from Mount Carmel for New York, via Chicago and St. Louis. Possibly the date may be postponed to April 1st, owing to circumstances beyond control, and which no gift of prescience could have foreseen.

Development of the South.

It is, of course, true that the South is developing in an industrial way very rapidly, probably more rapidly just at present than any other section of the country; but we believe that some allowance must be made for the published accounts of new enterprises coming from that quarter. The *Manufacturers' Record*, of Baltimore, which confines its operations almost entirely to the South, gives far more attention to the collection of information regarding the formation of new manufacturing enterprises than any other paper we know of, being, in fact, devoted mainly to this work. It has correspondents at all points through the South, who send in accounts of new enterprises, and it is evident that these correspondents do not assure themselves in every instance that a proposed factory or other enterprise is to be a bona fide thing, but simply send in an account of everything talked of, and a new account at every stage of its progress, provided there is any progress. Then, too, there is considerable evidence that men who are interested in real estate take pains to have it announced that a company with a very large capital stock has been formed, and will build immense factories in the town where this real estate is located, often stating that this concern is to move from some northern or eastern town. Every such report that people can be made to believe, helps in obtaining high prices for lots, and hence the incentive for the invention and circulation of the reports.

It is well-nigh impossible for any newspaper to sift and ascertain the full particulars regarding each and every one of these matters, and the only thing that can be done is for those interested to go through the listing process before becoming involved in any way. Attention has been called to the fact that a single issue of the paper named recently contained notices of the formation of companies for various industrial purposes in the South, representing a capital of \$10,000,000. It is a weekly paper, and it is easy to see that, if all these were bona fide, there would soon be no room left there for agricultural operations.

We repeat that it is true the South is advancing rapidly in these matters; but to those who might be inclined to think, from the preponderance of manufacturing news from that quarter, that the rest of the country was soon to be rendered of secondary importance in manufacturing matters, we would suggest going a little slow toward such a conclusion.

THE STATE OWNERSHIP OF RAILWAYS IN FRANCE.—When the network of State railways was created in France, it was intended to serve as an example of economical management and efficient working for the great companies. Whether those expectations have been realized may be judged from the results obtained in 1889. By purchases of lines originally, and subsequent extensions, the State network now forms a total of about 1650 miles. Their cost was about 800 millions, and the receipts last year exceeded the working expenses by \$258,697. The net revenue on capital was consequently a little over one per cent, and as the purchase-money was raised by the Treasury at four per cent, including the sinking fund, the actual loss on the year was nearly 24 millions. The proportion of working expenses to receipts was 76½ per cent, while those of the great companies ranged from 44 to 55 per cent. It must be admitted that all the great trunk lines belong to the companies, but they have also a number of secondary lines, worked at 80 or 90 per cent, or at a loss, the construction of which was imposed on them. The companies, however, pay a large sum to the State in the form of stamps on their shares and debentures, taxes on transfers, and dividends, etc., while the State lines yield nothing. The experiment can scarcely be considered a success.—*London Railway News*.

CURVES AND CABLE GRIPS.—The Consolidated Piedmont Cable Company of Alameda was made defendant in a suit in equity filed in the United States Court last week. The complainant corporation, the Pacific Cable Railroad Company of this city, alleges an infringement of certain patent rights by the defendant. It claims that Andrew S. Hallidie invented a tramway for curves and cable grips and obtained a patent for them. In June, 1886, he transferred all his rights and interests in them to the Pacific Cable Railroad Company. After the issuance of the letters patent, it is asserted the Piedmont company made and used and is now using an infringement of the patent. The complainant desires such damages as the court may deem proper, demands a delivery of all apparatus infringing the patent, and wants an injunction against its further use by the defendant.

NITRO GLYCERINE ABSORBENT.—Towle Bros. have out 12,600,000 feet of lumber this year. The pulp-mill will start up soon on material from 2000 cords of tamarack and fir. The firm has just placed in the pulp-mill a plant to convert sawdust into dry pulp for the use of giant powder manufacturers, says the *Truckee Republican*. The sawdust is ground very fine between millstones and is bolted like flour. It is used as an absorbent of nitro-glycerine in the manufacture of giant powder and other explosives. Its production is a new industry on this coast, and much of it has even been brought from Norway. Towle Bros. utilize the dust from their sawmills and also from the planing-mill for making this new material.

Black-listing Men.

The Supreme Court of the State of Texas has recently decided a case which has an important bearing on the matter of "black-listing" men by railroad companies. A man named Behee, who was formerly employed by the Missouri Pacific railroad, was discharged for alleged incompetency, and at the same time was black-listed, so that he could not obtain employment on any of the roads of Texas. He brought suit for damages and was defeated in the lower court, but on appeal to the higher court was awarded \$10,000 damages.

Where a man has been employed by a railroad company and has clearly shown that he is incompetent, and therefore liable to cause loss of life and property, it would certainly be a good thing if, by some means, other roads could be spared the trouble and responsibility of also making a trial of him to again demonstrate his incompetency, especially as this demonstration is liable to cause loss of property by the road, and of the lives of fellow-employees or passengers. Black-listing, if it were only employed in the case of men who were clearly and indisputably incompetent for railroad service, would accomplish this object and would result in substantial justice being done. But as it has been carried on, it has resulted in a great deal of injustice and undeserved hardship. Men who have offended the officers of roads in some way for which they were not in the least to blame, have in many cases, by the operation of the black-list, been prevented from obtaining positions by which they could obtain an honest living. We suppose that where a man has shown clearly that he is mentally or physically unfitted for service on a road, and that it is therefore dangerous to employ him on one, the courts would uphold the roads in protecting themselves against him; but it is a good thing that it has been by this decision shown that the black-list if used at all must be used with great care, and for good and sufficient reasons, not on account of the whims of any one, nor his personal spite.

THE MANUFACTURE OF RUBIES.—What is the use of exploring unknown and dangerous countries for rubies, when the secret of their artificial production has been discovered? This was the question which the Academy of Sciences discussed on the report of MM. Freymy and Verneil, who for some time past have been making chemical experiments in the manufacture of these stones. More valuable than mere theory was the fact that the two chemists exhibited some hundreds of specimens of the glittering red crystals they had succeeded in producing. The rubies were admitted by all to be much superior to anything hitherto manufactured. No little danger, however, attends the process. The chemicals have to be fused at a heat so intense that M. Verneil during the course of the experiments nearly lost his sight. While manufacturing rubies the two chemists found that at a certain stage of the operations crystals of the color of sapphires were produced, but the blue hitherto obtained has not been equal to the tint of the real gem.—*Pall Mall Gazette*.

HEINRICH SCHLIMMANN, the famous archaeologist, died at Berlin on Dec. 25th. He amassed a considerable fortune in commercial pursuits and was able to devote much time to the study of the classics. In 1863 he retired from business with the intention of exploring the Troad, but deferred the work until 1870, when he sought the historic ground which, largely through his efforts, has yielded treasures of incalculable value to archaeology and to modern knowledge of that fabled land. He spent the seasons of 1871-8 in excavating the plain of Hissadik, which he has ever since maintained to be the site of ancient Troy. This exploration has been his chief but not his only work. He published many volumes containing the result of his researches, and elaborate arguments based upon them.

MORE than half the railway track in the world is on this continent, and nearly half of the whole is in the United States. This proportion may or may not be kept up, as Asia and Africa are beginning to shorten their long distances by using steam hordes on the iron track. In the past four years 40,000 miles of track have been laid in America, and in the United States 30,000 miles of this, while all the rest of the world built only 24,000. Railroads in Europe cost an average of \$115,000 per mile. Here the average cost is \$60,000, and this is about the rate elsewhere. Rates of fare are, however, lower in Europe than here, the denser population and lighter expense for running the roads more than offsetting the difference in their original cost.

ACCORDING to recent news from Brazil, there are now 60 steamers plying on the Amazon, nearly all of them belonging to British capitalists; and it is stated that this commercial fleet will be greatly enlarged before the end of another year through British enterprise. Many of these steamers are of heavy tonnage and are more stanchly built than those that ply on the Mississippi. They carry on business with the towns along the banks of the Amazon, and some of them traverse its main affluents, the Rio Negro and Rio Madeira, while others go so far up toward its navigable headwaters that there is now a probability of its soon becoming a highway for Peruvians bound for Europe.

Proposed State Irrigation Service.

A little more than a year ago, Mr. A. J. Pillsbury, one of the editors of the *Tulare Register*, conceived the idea that inasmuch as the irrigation districts being formed under the Wright law were feeling their way along slowly and painfully over an untried road, an association of district officers ought to be formed by means of which an interchange of experiences might be had which would be decidedly helpful. The matter was talked up in the *Register* and other papers, and finally the Board of Directors of Tulare Irrigation District sent out invitations to other districts for a meeting at Tulare. The meeting was held on the 12th and 13th of September last and was very successful. It was there decided that a permanent association should be formed, and a committee was appointed to perfect a plan for organization, but only a sort of provisional form of government has thus far been effected.

Mr. Pillsbury was made secretary of this provisional form of association, and has maintained quite an active correspondence with districts and prominent friends of the district system ever since, and with the result that the subject has so grown upon him that, in his judgment, no form of association less comprehensive than his draft of a bill provides for will prove adequate to the needs of the district system of irrigation in California. This draft will be submitted to the next meeting of the association, to be held at Sacramento January 8th, and after undergoing such changes as are deemed advisable, will doubtless be presented to the Legislature.

The theory upon which this draft is founded is that irrigation is the paramount interest in California; that the State cannot become greatly populous without it, but can sustain a tremendous population when all of its waters shall have been put to economical and intelligent use; that the district system of irrigation is the only system which can enable irrigating neighborhoods to command capital for constructing needed irrigation works, or compel a frugal use of the waters of this State, and that the district system will in time supersede all other systems.

The State has conferred very great powers upon these irrigation districts, including the power to create bonded indebtedness, a power that is very likely to lead communities into extravagances, especially if there should chance to be a bit of a boom on anywhere, and very likely also to prompt sharpers to enter upon schemes of a swindling nature. There is certainly no lack of opportunity for extravagance and speculation, and a most rigid system of supervision is imperatively demanded; yet, strange to say, the State exercises no supervision whatever outside of the judiciary, which can do nothing of its own volition and so must be an inadequate protection.

It is proposed in the draft as printed below that the State shall delegate this supervisory power to the associated districts themselves, and certainly nobody can be more deeply interested in maintaining the faith and credit of all the districts. It is made the duty of the association to examine into the conduct of every district and publish reports of their condition. This alone will have a most salutary effect, but as the association is forbidden to negotiate the bonds of any district until its acts have been approved by a civil engineer and an attorney, to be selected by the association, it will be nearly impossible for any district to market its bonds without such approval, for capitalists will soon come to require it before considering purchases of bonds.

The financial aid asked from the State is not great. Indeed it is much less than other interests are getting. It is only asked that the secretary's office shall be maintained and the printing be done at public charge, which will cost no more than \$5000 a year at the outside. This is much cheaper than the State could discharge its duty of supervision for by any other method.

Of course there are other services besides that of supervision of districts, which it is expected that the association will perform. It is expected that it will develop a market for irrigation district bonds, hold annual conventions wherein the experiences of irrigators from all portions of the State will be compared and important recommendations made as to methods, and, by a system of correspondence and issue, and of bulletins, keep all the districts informed as to methods of procedure adopted here and there. In this way the best heads among the directors of all the districts will, by their advice and example, be able to shape the work for the districts throughout the State. In fact there seems to be no limit to the good results which might flow from associated action among all the irrigation districts of California, properly empowered and aided by the State.

The Proposed Law.

Mr. Pillsbury submits the following draft of a bill wholly upon his own individual responsibility, and not as an official act of the association with which he is connected.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. It shall be lawful for five or more irrigation districts organized under and by virtue of an Act entitled "An Act to provide for the organization and government of irrigation districts," approved March 7, 1887, to unite in forming a State Association of Irrigation Districts to which all irrigation districts

organized or to be organized under and by virtue of said Act shall be entitled to membership upon terms of equality. Such association when formed shall be a State institution.

SEC. 2. The State Association of Irrigation Districts shall have power and it shall be its duty to inquire into the acts and inspect the works of all irrigation districts organized or to be organized under the laws of this State, and its authorized agents shall not be denied access to the books and archives of any of said districts. Said association shall have power to make, ordain and establish and put into execution such by-laws, ordinances, rules and regulations as shall be necessary for the good government of said association; provided that said by-laws, ordinances, rules and regulations shall not be inconsistent with the laws or Constitution of this State or of the United States. Said association shall have power to contract and be contracted with, to sue and be sued, and its purpose shall be to promote the development of the district system of irrigation in California by securing the co-operation of the irrigation districts of the State in a united effort to that end. Said association shall have power to act as special agent for any irrigation district affiliated therewith, and when duly authorized so to act by such district may do any of the acts which such district itself may do, but said association shall have no power to bind any district without such special authority except as herein provided.

SEC. 3. The State Association of Irrigation Districts shall meet in open session in October of each year upon such day and at such place as shall have been determined at the preceding annual meeting, and each district belonging to such association shall be entitled to one vote in the meetings of such association and shall designate some number of its board of directors to represent such district at such meetings. Provision shall be made at such meetings for consideration and discussion of matters important to the development of irrigation in California and industries dependent thereon; and it shall be the duty of said association to use all suitable means to collect and diffuse such information as is calculated to aid in the development of irrigation and the district system thereof in this State, and shall make such recommendations and suggestions as experience and good policy shall dictate.

SEC. 4. The officers of said association shall consist of a board of five trustees, to be selected from among its accredited representatives, in whom shall vest the general prudential and financial affairs of said association, and whose duty it shall be to execute its by-laws, ordinances, rules, regulations and recommendations. There shall also be a president and vice-president of said association, who shall be members of the board of trustees and ex-officio president and vice-president thereof; and a secretary and treasurer who shall not be members of said board. The president and two trustees shall, at the first meeting of this association held subsequent to the approval of this Act, be elected to hold office until the second annual meeting of said association, and the vice-president and one trustee shall be elected to hold office until the first annual meeting held subsequent to the approval of this Act; and thereafter the terms of office of all trustees shall be two years, but all shall hold office until their successors have been elected and have qualified. If from any cause a vacancy shall occur in said board, it shall be filled by the remaining members until the next annual meeting of the association. The secretary and treasurer shall be appointed by the board of trustees and shall hold office for two years unless removed for good cause shown.

SEC. 5. For its maintenance said association shall have power, at its annual meetings, to levy an assessment upon the taxable property of all irrigation districts belonging thereto not to exceed one cent upon each \$100 of assessed valuation of property in such districts, and it shall be the duty of the boards of directors of such districts to include the same in their next regular tax levy, to collect the same with its other taxes and pay it over to the treasurer of the association on or before the first day of March of each year. The by-laws of said association may also provide for the payment by each district of an admission fee of \$50, before being entitled to membership therein. The association shall have the power to negotiate the sale of bonds of any district belonging thereto, when specially authorized so to do, and at a price not lower than a minimum price to be prescribed by the board of directors of said district, but before undertaking to negotiate the sale of such bonds, the legality of such bonds must be affirmed by an attorney to be selected by the board of trustees of said association, and the proposed works must be approved by a civil engineer to be selected by said trustees. The expense of such affirmation and approval shall be borne by the district offering bonds for sale, and for its services in selling said bonds the association shall be entitled to receive a commission not exceeding one per centum upon the face value of said bonds so sold, but from which said commission there shall be deducted the expense of affirmation and approval above referred to, whereupon the residue shall be paid to the treasurer of said association and become a part of the general fund thereof.

SEC. 6. It shall be the duty of the secretary of said association to attend all meetings of the association and of the board of trustees, and to make and preserve a record of such meetings; to conduct the correspondence of the association

and of the board of trustees and preserve a record of the same; to collect statistics and other information showing the actual condition and progress of irrigation in this State and elsewhere; to keep all accounts of the association and of the board of trustees; to visit each irrigation district in the State and prepare and cause to be published a report touching the area, character of soil and productions of said district, together with the nature and cost of irrigation works, quantity of water utilized, source of water supply, system of distribution, and such other matters as the board of trustees or association shall require, or shall seem to be of public concern. He shall correspond with investors and financial agencies, and use all proper means to develop and maintain a ready market for irrigation district bonds. He shall collect books, papers and pamphlets relating to irrigation and forms of production dependent thereon, and preserve the same. Under direction of the association and the board of trustees, he shall prepare for publication such reports as are required by law or the association or trustees; and by means of the issuance of periodical bulletins, he shall keep the irrigation districts belonging to the association constantly advised concerning all occurrences touching their interests. He shall appoint, subject to the approval of the board of trustees, a competent person as clerk and shall be responsible for the acts of said clerk. He shall maintain an office in the city of San Francisco at an expense for rent, stationery and incidentals, not exceeding \$500 per annum, and said office shall be open daily, except Sundays and legal holidays, from nine o'clock A. M. to four o'clock P. M. He shall be paid for his services as secretary the sum of \$200 per month, and his actual traveling expenses not to exceed \$500 during any one year. His clerk shall be paid a salary (as such clerk) of \$50 per month, each to be paid as other State officers are paid. Said expenditures herein provided for are to date from the day upon which a copy of the by-laws of said association, together with a certificate of organization, signed by the president and secretary thereof, is filed in the office of Secretary of State, and are to be paid out of the general fund in the State treasury.

SEC. 7. All printing required to be done by this Act shall be done by the State Printer.

An Irrigation Convention.

A session of the State Association of Irrigation Districts of California is hereby called to meet at Sacramento, California (in such hall of meeting as shall hereafter be determined upon, due notice whereof will be given), upon Thursday, Jan. 8, 1891, at 10 o'clock A. M.

The purposes of said meeting will be to perfect the organization of said State Association of Irrigation Districts; to agree upon and formulate such amendments to the irrigation laws of this State as shall be deemed needful and expedient; to use all proper means to secure their enactment by the Legislature and approval by the Governor; and to consider such other matters as the association shall be pleased to consider.

In the deliberations of such association each irrigation district which shall have become a member thereof, shall be entitled to one vote, and the board of directors of such district should designate, by resolution, one of their number who shall be empowered to cast the vote of such district, and a copy of such resolution under seal of said district shall constitute the credentials required. It is earnestly hoped that every irrigation district in California will be authoritatively represented at such meeting, for it is believed that it will be productive of most important results. It will not be objectionable to have more than one member of district boards of directors as well as other district officers present, and doubtless they will be asked to take part in the discussions (but not in the balloting), and it would be well, too, for each district to extend to known friends of the district system a cordial invitation to be present with full privileges as to debate.

The dispatching of business would be much facilitated if persons having amendments to the law to be proposed would reduce them, as nearly as may be, to proper form before presentation. Districts which have not already joined the association will be given an opportunity to join when the association meets.

J. W. NANCE, President.

A. J. PILLSBURY, Secretary.

ADVISED FROM OHIO report a diminishing supply of natural gas at important manufacturing centers. It can hardly be said that the wells are failing, but the fact is patent that the volume now available is much less than a year since. In other localities the same conditions have been encountered, but the wells were found to have become choked by deposits from the gas, and to have flowed as freely as ever when the obstructions were removed. The manufacturers of Columbus have taken no chances on this contingency, however, but have turned to other fuel. In the cities of Toledo, Dayton, Springfield and Urbana, heavy consumers have been notified by the gas companies to use other fuel, as domestic consumers only will hereafter be supplied. Coal-miners and coal-carrying railroads are of course taking much comfort from this condition of affairs.

ANCIENT CHINESE DRAWINGS.—In collections centuries old, to be seen in China and Japan, are specimens of the most remarkable drawings in the world—pictures of all kinds drawn with the thumb nail.

England as Well as America Suffers Through Lack of Money.

England secured its gigantic commercial finances as much by wise financiering as through the activity or enterprise of its merchants. It had a large, ample metallic and paper currency which it loaned and diffused throughout the world. This yielded a hundred-fold return. Of late years, England's currency, like our own, has become contracted through the growth of wealth and the necessary absorption of money. While heretofore she was able to supply foreign requirements, she is now hardly able to attend to home wants. It is not that there is less money, but that the growing interests of a vast people have so spread out that a great deal larger ratio of currency is requisite. The result being reflected is that in order to meet the home requirements, capital has to be withdrawn from foreign enterprises, commerce and investments that have heretofore been found profitable.

While England is to-day suffering from lack of a liberal currency, so is the United States suffering from a greatly contracted one. A pound sterling could practically go all over England in 24 hours, but in our country it takes over a week to pass from one end to the other.

To-day all the financiers of the country are anxiously watching the money market, fearful that the recent stringency of the market will be repeated with possibly more direful results. We do not fear any further immediate trouble in the Wall-street world, as danger pointed out clearly is seldom encountered. If financial troubles are to ensue, we believe that Wall street will be left behind and a visit paid to the mercantile interests.

This country—one and all, great and small—uses money. There is little gained by its being contracted, and no reason why it should stay so, except that our Government representatives lack the ability and intelligence of Chase, Hamilton, or Webster.

The currency of the people can be increased in divers ways, and there is no question which Congress can study with greater benefit to our people than by what way it is to be done.—*Financial Record.*

THE UTILIZATION OF NIAGARA.—From information furnished by the Cataract Construction Co., it appears that at a consultation of the engineers of the company, held in London, it was decided, in starting the tunnel from the lower river, that the portal should be so located as to have its floor 20 feet below the average water level, the only part of the tunnel mouth showing above water being the arched roof of nine feet radius. From this opening the tunnel will be carried on an un-grade of 0.4% (4 feet per 1000), making the floor slope less than the hydraulic gradient required to enable a tunnel of 400 square feet section to deliver the water required to give 120,000 horse-power with a head of 140 feet. The expected theoretical advantage to be gained by treating the tunnel as a full running pipe war, we believe, carefully considered and anticipated by the partial submergence of the floor of the tunnel by the water of the lower river for about 5000 feet of its length, and the possible total submergence or filling from above by an adjustable regulator at or near the discharge mouth of the tunnel. The required hydraulic slope that may eventually be wanted is perhaps 0.7% (7 feet per 1000), or what will give a mean velocity of current of about 25 feet per second—a speed no greater than already exists in some parts of the Niagara river below the falls. It will doubtless be some years before the capacity of the tunnel will be taxed to its utmost, and until that time comes the tunnel will be a stone-walled waterway with an arched roof above the water. Access can be had to all parts of its length, the current due to the slope being such as will permit examination upon days when the fewest mills are running.

SUBMARINE TELEGRAPHS.—The international bureau of telegraph administrations has made an interesting report on the extent to which submarine telegraphy has grown. The submarine system of the world, says the report, embodies 120,079 nautical miles of cable, of which various Government administrations own and operate 12,524 miles, while the remainder is in the hands of private companies. The total cost of these cables is estimated to be \$200,000,000. The Eastern Telegraph Co., which owns the cable between England and India, operates 21,860 miles, with a far East extension of 12,958 miles more. Africa is completely surrounded by submarine cables, with an occasional branch to the coast, the last link having been finished to Cape Town only last year. To encircle the Dark Continent, 17,000 miles of cable was required, and a dozen or more companies, backed and aided by the British, French, Spanish and Portuguese Governments, participated in the work. The North Atlantic is spanned by 11 cables, all laid since 1870, and footing up an aggregate of over 30,000 miles between North America and Europe.

In the Mexican State of Sinaloa, where American capital has been largely invested, there are in operation three cotton mills and three sugar mills, and in the city of Mazatlan is a well-equipped iron foundry which is now turning out mining machinery said to be equal to imported.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

STOPPED MILLING.—Amador Ledger, Dec. 27: The McKenzie mill, running on Clinton Peak rock, has been compelled to suspend operations in consequence of the late rains having made hauling impracticable. It is expected that the new litigation in regard to the Amador gold-mill will stop the use of a portion of the mill for crushing the Doyle rock.

PLYMOUTH.—There are no contracts for wood and timbers being let at the mines so far as we can hear, which makes it look as if the mines would run on a very light scale next year.

SUTTER CREEK.—At the Lincoln, operations have been resumed under the supervision of Mrs. Slewart, who is an excellent financial manager. Everything at the North Star and Rose mines is moving along as usual.

Calaveras.

STICKLE.—Mountain Echo, Dec. 25: Levels are being run north and south on the 600-foot station in the Stickle mine. It is reported that 20 men have been laid off at the Union mine at Copperopolis.

CENTRAL HILL MINES.—Calaveras Prospect, Dec. 27: There is quite a boom on Central Hill at present. The Union Shaft gravel mine there has about 20 men employed. A new 8-stamp mill is being constructed under the management of Mr. Morrill. The mill will be completed as soon as possible. The Benson mine is looking better. Rich gravel has been found there lately. The Cassinelli mine is looking well. A small quantity of gravel was washed last week, and it paid better than was expected. The Agostini and Spinola claim is lying idle at present, but will be started up in the spring. The gravel claim formerly owned by Spinola & Ellis is being worked by C. W. Getchell. Several men have been clearing a road and ground on which to put a hoisting engine and pumping outfit, and as soon as the weather will permit in the spring, a shaft will be sunk to the ledge, with a view to prospecting the channel. The claim is on the famous blue lead and is undoubtedly rich.

El Dorado.

CRUSHING COMMENCED.—Georgetown Gazette, Dec. 27: We were over to the Van mine, a half mile north of town, on Tuesday afternoon, to see the Huntington mill work. It had been running steadily since it first started Monday morning, without a mishap—just 35 days since they broke ground. We were cordially received by Supt. P. P. Tischer and C. S. Hersey, the millwright and amalgamator. The mill works smoothly, with little noise and without a jar. The sieves are about 40 mesh and the discharge simply perfect. The mill is fed by a Hendy feeder. The upper silver plates cover a space 4x12 feet and the lower ones 2x12 feet. At the foot of the wide plates is a neatly finished dug-out trough, with a two or three inch drop, and below the lower plates another trough. The mill is now reducing 18 tons of the soft ore in 24 hours, which will undoubtedly be increased to 24 tons, as not a particle of gold or quick passes beyond the lower plates, more than twenty careful pao tests having been made, while pan tests of the pulp as it flows from the mill invariably show traces of fine gold. It is the plan of the amalgamator to retain nearly all the gold in the battery. We were permitted to make these tests to our entire satisfaction. While the ore on the dump never fails to show a good pay prospect, and not a particle passes beyond the plates, it is a matter of much satisfaction to all who are interested in securing an economical method of saving the fine gold of our mines that such a method has finally been established in our midst. Quick is used sparingly in the battery, a very little being added every half hour. Undoubtedly this is the most perfect gold-saving mill and plate arrangement that has ever operated in this district. Much credit is due to the skill of Mr. Hersey for the perfect manner in which the plant has been built. So perfectly adjusted is all the machinery that only 15 inches of water is required to run the mill and shaft pump. Six hundred feet of pipe conveys the water to a Pelton wheel under 130 feet pressure. The shaft is 55 feet in depth, 5x10 in the clear, being timbered in two compartments, and worked by two shifts of three men, two at the windlass. At 60 feet a crosscut will be made. At present the mill is fed with ore from the surface. Should the test prove satisfactory, more batteries will be added and hoisting works put up.

NOTES.—Georgetown Gazette, Dec. 27: Everything is running smoothly at the Taylor mine with a prospect of a good winter's run. The mill and hoisting works at the Van mine are expected to start up this week. The works are now under cover. The pump started up yesterday and work of sinking resumed to-day. The Lone Jack Co. is preparing to commence work in that mine soon. At present they are putting in new machinery to the hoist, and making preparations to sink. Hugh Nichols is to be their foreman. Strahl's slate quarry and works at Kelsey are running in good shape, under a force of 15 men. Mr. Dobbs, of the city meat market, brought up some fine samples of roofing slate from there last week, which is superior to any we have yet seen. It is said that the quality of the Kelsey slate is better than that of the Chili Bar quarry. When we see this fine roofing slate, and know how easily and cheaply it can be obtained, we wonder why it is not more universally used. Who will be the first to put on a slate roof in Georgetown?

Nevada.

THE HARMONY.—Tidings, Dec. 27: It is said that the strike in the Harmony gravel mine is developing richer than ever and that the clean-up from gravel worked exceeded expectations.

THE IDAHO COMPANY TO PROSPECT.—The Idaho Company will soon place a water-power plant on the shaft on the croppings north of what has heretofore been considered the lode line and which is now supposed to indicate the true line of the Eureka Idaho Maryland lode. The shaft is on the ground recently acquired from the Maryland company, is 40 feet in depth, and shows a strong vein. It is to be given depth and this theory confirmed or proven false. It is likely, however, that the theory will hold good and much valuable quartz be found.

SPECIMENS FROM THE EMPIRE.—In the 1500

level of the Empire mine very rich rock has been found in the ledge. One piece extracted is worth \$1000 and that extracted altogether will foot up several thousand dollars. Pretty good for the oldest working mine in the district!

ONONDAGA MINING COMPANY.—The annual meeting of this company was held Tuesday and directors and officers elected as follows: Geo. Fletcher, Pres.; Jno. F. Kidder, Vice pres.; E. H. Brown, M. L. Elliott and J. B. Wright, the latter of Sacramento, Thomas J. Mitchell is Treasurer and Secretary and M. L. Elliott is Superintendent. An assessment of one cent per share was levied.

MANHATTAN.—The new chute of ore cut in the Manhattan mine recently has increased in size and somewhat deteriorated in quality.

EMPIRE MINE.—Grass Valley Union, Dec. 27: Rumors ran high on Wednesday concerning the Empire mine. A specimen "streak" was struck in the 1500 level and all the forenoon a large amount of gold specimens was taken from the level. Several rumors were to the effect that \$1700 were taken out in specimens during the forenoon, but Mr. Starr, superintendent of the mine, informs our scribe that the amount did not reach that figure. Mr. Starr also informs us that the ledge where they are now working on the 1500 is a large ore and very valuable.

Placer.

MAYFLOWER.—Placer Herald, Dec. 27: F. Chappell, president of the Mayflower Mining Co., says that the Mayflower mine is in good shape and yielding lots of lucre.

THE GOLDEN RIVER.—Republican, Dec. 28: C. F. Hoffman, superintendent of the Hogback and Red Point mines, was in Auburn last Friday and showed a handful of coarse gold that was taken out of the gravel where the upraise from the lower Hogback tunnel cut through the rimrock into the channel. The gold is in the form of small nuggets, and in that respect differs from that taken out at Red Point, which is in the form of scales. The difference in the character of the gold tends to confirm the opinion, based upon the trend of the rimrock and other facts, that the channel struck at Hogback is not the one encountered at Red Point. All the surveys that have been made indicate that there are at least two channels down that divide. The bottom of the channel has not been reached at Hogback, but the inequalities of the bedrock are being followed by a drift, and it is expected that the trough will be found soon. The flooding of coarse gold in the gravel along the rim and above the bottom indicates that the channel is very rich and will yield big returns. Twenty-two men are now at work in the Hogback tunnel. At Red Point about 60 men are employed and the mine is yielding between \$4000 and \$6000 a month. In 1889 the Red Point gravel yielded \$3 a carload, and the total yield for the year was \$65,000. For 1890, up to December, the mine produced \$54,000, the value of the gravel per carload being \$2.50. Under favorable conditions \$2.50 per carload will pay expenses, all over that being profit, but the Red Point channel narrowed down and ran into a hole, which increased the cost of working and taking out the gravel. Water impeded the work and the miners were obliged to throw the gravel up two platforms to get it out. The irregularity of the bedrock prevented the laying of tracks for ore cars, and wheelbarrows had to be used in place of cars. The extra expense wiped out the margin of profit, and although the mine paid expenses, the stockholders got no dividends. Supt. Hoffman reports that the channel is widening and he hopes to make the mine a dividend-paying property next year. The French company that owns the Red Point and Hogback mines has spent a great deal of money but has received no dividends yet. The Red Point frequently has yielded a great deal more than enough to pay expenses, but the surplus has been applied to development work and the extension of the tunnel.

San Diego.

MINES AROUND JULIAN.—Sentinel, Dec. 26: The Owens mine, as was announced last week, has changed hands. Hugh R. Hildreth, of San Diego, one of the directors of the First National Bank, is principal owner and general manager. William Goodwin has been chosen foreman of the mine and W. J. Holmes foreman of the mill. Their own hoist is on the ground and being put in place. The boiler will arrive next week and be put down as soon as possible. The machinery is being overhauled and put in good shape for a long run. The work of hauling out the water will commence as soon as the tank arrives, and when finished a force of men will be put to work taking out ore for the mill and thoroughly developing the mine. The Owens has been one of the best paying properties in the camp, and now that it is in the hands of competent men, backed by capital, it will begin to turn out the bullion as of yore. Mr. Hildreth is one of the principal owners of the 4th of July mine situated only 200 yards from the main street of Julian. They have already applied for a patent and as soon as the Owens is pumped out and in working order the small hoist will be moved to the 4th of July and the work of development commenced in good earnest. At present the shaft on this mine is only 50 feet deep and already water has been struck. The ledge is one of the largest in the camp and some very flattering assays have been obtained from ore out of the bottom of the shaft.

CINCINNATI BELLE.—Superintendent Wilkins was in from the Gold King this week and informed us that the Cincinnati Belle would start up again next week. It will be remembered that this is the mine out of which so much specimen ore was taken by W. L. Fredericks. It has been idle now for some time, owing to bad roads for getting in material, but now that the new grade is finished and machinery and supplies can be got to the property it will again be worked and the rich ore mined at the Gold King mill in Banner, now nearing completion.

THE BIG TUNNEL.—Through the courtesy of Waldo Waterman we had the privilege of examining the Blue Hill tunnel last week. It is now into the mountain a distance of nearly 400 feet. Several ledges have already been cut and when we were there the face of the tunnel was showing some fine-looking quartz. Six hundred feet has yet to be run before the contract is completed. The tunnel is a fine piece of work and a credit to the contractors, who are making good pay as they go along.

LONE OAK.—A. J. Burnett is still sinking on the Lone Oak, with flattering success.

BLACK EAGLE.—The Black Eagle M. Co. this week filed articles of incorporation, capital stock, \$500,000.

This, it will be remembered, is the new strike on the Mesa Graode.

FRACTION.—Good reports come from the Fraction mine, owned by MacDonald and Waterman. They are taking out good ore.

Shaeta.

FLAT CREEK.—Redding Free Press, Dec. 27: George Smith sold a mine on Flat Creek—the property of Mr. Longfield—this week, to the reduction works below town. These works, we understand, will be removed to the mine purchased. Flat Creek is rich in gold quartz, some of the finest specimens coming from that section. The trouble has been in working the quartz, the fineness of the gold causing it to escape, but under the dry process it is thought that it can be saved.

RICH SPOT.—John Tiffin says that he made a good stake for Christmas in the following manner: He had given away his prospecting pans, but wishing to do a little prospecting, gave an acquaintance 25 cents for a pan. He asked if it was a lucky pan, and was told that it was. So he went to his old stamping ground in the Lower Springs district, and while prospecting a short distance from Miller's house, got \$50 in gold and quartz from a single pan of dirt. These rich spots are not all discovered yet.

COAL.—The recent discovery of valuable coal in this county seems to create considerable comment and it is to be hoped that capital will become interested and another profitable industry added to those already established. After coal mining will come discoveries of natural gas and coal oil.

STRIKE.—A correspondent writing from Delta says: "A rich strike was made recently on Chace gulch, a tributary of Dog creek. The ledge crops out a foot or two above the ground for 1000 feet down the mountain side. The ledge is rich in free millio gold, and was discovered and located by Asa Elsoo and Thomas O. Roberts."

Sierra.

TRAMWAY.—Mountain Messenger, Dec. 27: We understand that the tramway at the Mountain mine is working finely. A gentleman named Bernhardt is out from New York to examine the Red Chief mine, near Forest City. Mr. Turner has bought the quartz property, formerly owned by A. W. Crowell, at Nigger Canyon.

Trinitv.

NEW RIVER.—Journal, Dec. 27: J. A. McLeod of New River is in town this week and says times are rather quiet in New River this winter. The following mines are being operated: The Mountain Boomer, Hard Tack, Sherwood, Excelsior, Uncle Sam and Ridgeway. Considerable work is being done on leases. On the Ridgeway they have raised 160 feet from the tunnel and are now running a level to tap the ledge. Ore is being taken out and development work being done on the other mines. Two mills are running. There are about 60 men in camp and some sickness prevails. No snow in the camp at present.

CANYON CREEK.—On our visit to Canyon Creek last Saturday we learned that Grigsby, Shock & Shattuck were making a good run on very good-looking ore. They have not made a clean-up yet, but the battery and plates show very well, and the clean-up when made will no doubt prove satisfactory. Their ledge is looking better than ever and we think the Buck's Ranch mine is sure to turn out well. At the Chloride mine there is not sufficient water with which to turn the mill and it is not likely to increase very much till about February.

SUPT. APPOINTED.—J. R. Flagg has been appointed Superintendent of the Taylor Flat mine. Mr. Flagg is a practical miner of many years' experience, and very few can handle a mine to better advantage than he.

Tuolumne.

COSMOPOLITE MINE.—Union Democrat, Dec. 27: Messrs. Stanley, Pool and Shaw have driven a tunnel into new ground on the Cosmopolite mines at Groveland and now have a very promising prospect to the face of the tuooel. The quartz will be worked in a mill, after it has been carefully sorted and the pockets or specimens picked out and worked up in a hand crusher. This is a vein that our old-timers say never broke any one and never failed to pay any one who worked it, so the owners look for a golden harvest soon. The vein yields pockets, over large, but the miner's tradition says plenty of them.

INCORPORATED.—Independent, Dec. 27: Otto Kanig returned from San Francisco this week. During his absence he has succeeded in incorporating the Chlorinda Consolidated Mining Co., the property of which is situated about a mile above Parro's Ferry on the Stanislaus river, formerly known as the McKenny and Kanig quartz mine. Half of the capital stock will be sold, and the proceeds devoted to developing the property. About 6000 shares have already been sold, most of the buyers living in San Francisco.

NEVADA.

Wahoe District.

HALE & NORCROSS.—Virginia Enterprise, Dec. 27: On the 800 level the west crosscut is still in vein porphyry. The east crosscut on the 900 level has passed out of low-grade quartz into porphyry. The west opposite the east crosscut was advanced 20 feet; total length, 40 feet. This crosscut has passed through some rich ore. The face is now in hard quartz and porphyry.

EXCHEQUER.—East crosscut, 150 feet south of north line, 500 level, is out 354 feet; face in clay and porphyry and stringers of quartz.

SAVAGE.—The winze from the track floor on the 1300 level still continues in good ore. A good deal of exploring work is being done and ore is being mined on the 300, 400, 500, 600, 750 and 1300 levels. Are sending weekly to the Mexican mill about 500 tons of ore, averaging \$16 25 a ton.

SILVER HILL.—160 level: Northeast drift from winze is out 530 feet; face in porphyry. 334 level: Northwest drift is out 735 feet; face in hard porphyry.

CON. NEW YORK.—The north drift on the 850 level is out from No. 1 west crosscut 473 feet; face in porphyry. The north drift on the 1100 level is in from the shaft 360 feet; face in quartz and porphyry.

ANDES.—During the past week north drift, 420 level, was advanced 15 feet; the face in porphyry and clay. South drift, 420 level, was extended 19 feet; formation, clay and porphyry.

SEG. BELCHER.—The 850 raise is in a mixture of quartz and porphyry that gives low assays.

JUSTICE.—The north drift, 822 level, is out 130

feet and is in hard rock. The west drift, 822 level, is out 142 feet; face in low-grade quartz. There has been no work done on the 370 level since last report. Are shipping to the mill an average of 180 tons of ore assaying \$20.50 a ton.

OVERMAN.—Good progress is making in the raise and drift on the 100 level.

UTAH.—The north lateral drift from the main west drift from the shaft has been extended 50 feet; total length, 128 feet, in a porphyry, clay and quartz formation.

CHALLENGE CON.—The joint north drift on the 300 level has developed a two-foot streak of fair ore.

CROWN POINT.—The new northwest drift on the 500 level still continues in soft and favorable material. Are extracting from the 1800 stop about 15 tons of ore per day that assays from \$18 to \$20 per ton.

BELCHER.—West crosscut No. 1 on the 290 level is being pushed for the west wall. The south drift on the same level continues to cut bunches and streaks of ore. The raise on this level is still in a mixture of clay and quartz. About 250 tons of ore a week are being sent to the Vivian mill; average assay, \$18.50 a ton.

CON. CAL. & VA.—Ore continues to be extracted from the 1200, 1300, 1500, 1600 and 1650 levels. A considerable amount of exploration work is also being done in the mine. About the usual number of tons of ore will be sent to the river mills this week. The average assay value will be about the same as last week.

ALTA.—The stopes are yielding the usual quality of ore, and the mill is crushing about 315 tons of \$18 rock, as per battery samples, and are doing prospecting work.

YELLOW JACKET.—Doing extensive prospecting throughout the mine and milling about 60 tons of \$18 ore daily.

IMPERIAL.—On the upper levels the old stopes are being overhauled and some fair milling ore found.

OPHIR.—The south drift from the west drift on the 1300 level is still in quartz that gives low assays.

UNION CON.—No. 2 crosscut from the north lateral drift on the 1450 level is being advanced in a soft and favorable porphyry formation.

SIERRA NEVADA.—The northwest drift from the 630 shaft station is making good headway in a porphyry formation.

MEXICAN.—East crosscut No. 1 from the main north lateral drift continues in a porphyry formation showing some clay.

KENTUCK.—Still repairing and retimbering the main shaft.

OCCIDENTAL CON.—Have discontinued extraction of ore for the present on the 350, 400 and 450 levels and are now engaged in timbering and repairing tracks and chutes. The south drift from the bottom of No. 5 incline on the 650 level, is in 64 feet, showing low grade ore. Milled during the week 285 tons of ore of the average value of \$16.10 per ton.

POTOSI.—The face of the north lateral drift on the 1200 level is in ore of a fair grade. The south lateral drift from the Chollar incline, 1300 level, is still in porphyry.

WEST CONSTOCK.—Are making a road from the lower tunnel to connect with the Ophir grade, and when completed, will commence to ship ore to Taylor's mill, Silver City, there being a large quantity of high-grade ore on hand.

CHOLLAR.—Extracted and sent to the mill the past week 542 tons of ore. Average battery assay, \$18.31 a ton.

MASCOT.—In running a cut on the ground have come to a fine looking ledge of quartz giving some good assays.

Belmont District.

RICH ORE.—Belmont Courier, Dec. 25: Green Aldrich has made a rich strike in his mine, situated about 1½ miles east of Belmont. The ore is very rich in silver, assaying all the way from \$800 to \$1500 to the ton. He has now 1½ tons of this class of ore in sacks. The indications are that he has encountered a body of good ore, and if it holds out, there will be at least one Belmonter who will be able to take in the World's Fair at Chicago.

Cortez District.

THE CORTEZ MINE.—People's Advocate, Dec. 27: The Cortez mining property is the most valuable, all things considered, in the State. While the mines are situated about three-quarters of a mile in Eureka county, the mill, assay office, blacksmith shop, three large stables, store and hotel are some 1400 feet in Lander county. There are 30 men constantly employed about the premises in this county, and probably 75 in the mines. The employment is steady, lasting as long as the work is faithfully performed and the employed desires his position. It is conceded that the monthly profit of the Cortez plant is in the neighborhood of \$30,000, and everything is done on a cash basis.

Ellsworth District.

COPPER.—Belmont Courier, Dec. 27: Some rich silver and copper ore was hauled recently from Ellsworth to the Ledlie reduction works. Good ore is known to exist in that part of Nye county.

Eureka District.

ORE SHIPMENTS.—Eureka Sentinel, Dec. 27: During the week the Eureka and Palisade Railroad Co. shipped 215 tons of ore to the Salt Lake City smelters. The following lots of ore were received at the Eureka Con. reduction works for treatment during the week: From the Dunderberg mine, 25 tons; Silver Nugget, 5½ tons; Summit, 36 tons; Belmont, 10 tons; Williamsburg, 14 tons; Hanburg, 65½ tons; White Pine, 17½ tons; Silver West, 28 tons; Wide West, 25 tons; Woodchopper, 4½ tons; Phenix, 58½ tons; Seventy-six, 2½ tons; Reveille, 4 tons; Lord Byron, 22½ tons; J. W. Lambert, 3½ tons.

Jefferson District.

SILVER ORES.—Belmont Courier, Dec. 27: The miners of Jefferson district, who have had several tons of silver ore worked at the Ledlie works, are well pleased with the result of the crushing. Some of the ore proved to be quite rich.

Lewis District.

CONSOLIDATED.—Virginia Enterprise, Dec. 27: All the mining claims on the main lode of Lewis have been consolidated. Lewis is 14 miles south of Battle Mountain, in the Toiyabe mountains. The camp once had a population of 400. The lode is about 10 feet wide, assays from \$15 to \$175 and crops out for over a mile. The mines in Lewis can-

yon were discovered in 1872. The cause of the collapse is plain when we learn that only \$50,000 was ever spent in development work, while \$500,000 was expended in building reduction works. Had the order of expenditure been reversed, all would no doubt have prospered.

Tybo District.

LEACHING.—Belmont *Courier*, Dec. 27: The Tybo mill was running this week on ore from the Dimick mine. The leaching works are running satisfactorily.

Pahranagat Lake District.

WORK COMMENCED.—Pioche *Record*, Dec. 25: Mr. George S. Barber, mentioned last week as having taken a six months' bond and lease on the Bal-back mine in Pahranagat Lake district, went down to that place during the week to begin work on the property. Several loads of mining supplies left town during the week also, and work will be pushed vigorously. Nine men will be employed for the present.

ARIZONA.

MINING NOTES.—*Courier*, Dec. 25: Messrs. Helm & Cover have gone to the Tiger. Big doings in Copper Basin, just over the divide from Prescott. Mr. Williams, superintendent for Phelps, Dodge & Co., is erecting a roaster, leaching plant, etc. New Senator mill, belonging to same company, is ready to go. Mine said to be a big fellow and rich in gold. Prof. James Douglas, who got the company to invest here, is making us another visit. He sent a man north Saturday last to look up a deposit of lime. An electric plant, for placer mining is en route to Peeples Valley. Phelps, Dodge & Co. will send two carloads of Arizona ore, at their own expense, to the World's Fair.

GILA REND ITEMS.—The river, after several days of high water, became fordable to-day. Col. B. B. Barney has contracted with Eugene Caruthers for a ferry, to facilitate work under the new Citrus canal. A heavy hailstorm fell between here and Black Gap, 19 miles south, last Saturday. Frank D. Welcome is rushing freight through to Gunsight mine for the Silver Gilt Co. Peter Hargraves, while detained south of the river by high water, made a trip to Gunsight and was astonished at the immense ore reserves there. He returned to his ranch on Enterprise canal, 16 miles north of here, to-day.

IDAHO.

ANOTHER MINING DEAL.—*Avalanche*, Dec. 29: A deal was consummated this week between Mrs. A. J. Sands, of Caldwell, and M. F. Leech of Boulder, Colo.; John Longmaid and H. Stevenson of Salt Lake City, Utah, by which the three gentlemen become the owners of the Stormy Hill and War Eagle properties. They have already made arrangements for working the property. Simon Harris has been engaged as foreman, with orders to put on a double shift of men to re-timber the Stormy Hill shaft and sink the same as rapidly as practicable to the depth of 500 feet. A small hoist engine will be moved to the shaft at once, which will be used until spring, when a new shaft-house will be erected and a more complete equipment supplied. The War Eagle and Stormy Hill properties adjoin each other on the same ledge. The War Eagle was worked a number of years ago by a New York company, to a depth of 800 feet, and yielded about half a million dollars. It was worked north from the shaft to that depth for 150 feet, to the north boundary of the claim, and south on one of the lower levels nearly 600 feet, crossing in that distance a porphyry dyke, through and adjoining which very rich ore was opened up, and but very little stopping done. The Stormy Hill, which lies to the south of the War Eagle, has a shaft on it now 190 feet deep. This shaft is only 15 feet from the War Eagle south line and will be made the main working shaft of the two mines. Levels will be run from this shaft north into War Eagle ground, to connect with the old work. The Stormy Hill shaft has been in good pay ground almost from the surface and in the bottom of the shaft assays high. This property lies about 1000 feet east and parallel with the great Poorman lode. It has been considered a most promising property, but has been tied up for a number of years on account of business complications and the decease of Mr. A. S. Sands, the former owner. It has now passed into the hands of practical and experienced miners and business men, and promises to add to the production of the camp, and we believe from our own personal knowledge of the mines, will prove a big paying investment for the new operators.

THE NEW DISCOVERIES NORTH OF THE DE LAMAR.—Some ten days ago specimens of quartz very rich in horn silver were brought to town and a big story circulated concerning a rich find made by two brothers named Walneer, three or four miles north of De Lamar. We made no mention of this last week for the reason that such reports are often like bumble-bees, which when first hatched. In fact, we took the precaution to send a man there who reported that the story was exaggerated. Since then three prospectors, Messrs. Walter Stanley, Dave Farmer and Herb. Inman, have been at work near where the first find was made, and have made a location. They report that they have found a very rich ledge, more than two feet in width, which will run nearly 3000 to the ton. They say there is no doubt about their having a true and well defined vein of ore. They brought some very rich specimens of ore in with them. The ore is a hard gray quartz with thick seams of horn silver running through it. Their location is a few hundred feet north of the location made by the twin brothers, and they think on the same lode. The ore is identical in character. They say that where the twins found their ore the ledge had broken over and that they had been working above it, and that is the reason of the contradictory reports coming here. They also say that the ledge is located where no one but a tenderfoot would have thought of prospecting. It is only a few feet from a trail which has been traveled by miners and cowboys for many years. The season is now so far gone that no cabin can be built or supplies procured for the men for the winter, consequently but little more will be known of the find until spring.

FLINT REDIVIVUS.—The reconstruction of the big mill at Flint is now about completed and the battery stamps will next week waken the echoes of that canyon, which has heard no louder noise than the tinkle of a cow-bell or the bark of Bogle's dog "Kaiser" for nearly four years. When the rollers stopped crushing ore, four years ago, they were about 700 tons ahead of the concentrators then

used to save the mineral, and the failure of the rollers to crush fine enough left this amount of un-worked ore in the mill. Careful sampling and assays show this ore to be worth over \$45 per ton. It will all now be run through the batteries and over light humper concentrators, which it is thought will save a greater portion of its value. When this is done, if it is found that the tailings still retain value, roasters and pans will be put in and they will be reworked. In addition to the 700 tons now in the mill, some 400 tons of ore are being hauled from the property purchased by Mr. Leech last year. The latter is high grade ore, slightly base, and will be worked, if practicable, in the same manner. Should this enterprise prove successful, the Flint district will become a big camp. There is no doubt about the ore being there to keep more than one big mill running until worn out, and the ore is high grade. Its slightly refractory character is the only drawback. With William Quayle's, Judge Lynam's and other properties at Cottonwood, and the several mines of the old Flint company, and Mr. Leech's mines at Flint, the output of rich ore can be made very large, and it is hoped that this experiment will prevent them remaining idle, waiting for a railroad and smelter.

LOWER CALIFORNIA.

NOTES FROM ALAMO.—*Lower Californian*, Dec. 18: No special developments have been made in Alamo during the past week. More strangers than usual are in town and one or two deals are rumored. The mills now running are the Princessa, Aurora, Col. Lane's and the Montezuma. The Princessa mine is surprising everybody with its richness and promise. A new vein, or rather spur, was found within the limits of the Princessa's ground last week. The new find is about 10 inches wide and very rich. The Ulises is not far behind the Princessa. Its ore is not so rich, but there is a great quantity in sight. It is worked night and day, while its neighbor, the Indian, employs only a day shift. The latter is a small ledge, but rich, and its limits are abundant in stringers and spurs of great richness. The Aurora hoisting works are ready for the machinery which is now being put in, and another whistle will soon be added to the chorus. President Russell is running things alone for awhile. Mr. Rhodes having returned to Los Angeles to spend Christmas. The Scorpion mine, which was bought a few weeks ago by a Los Angeles syndicate, will be started up at once under the management of Frank Phelps, who has engaged a number of men to work. The ore will be milled by the Manzanita Co., which is thought to be interested in the mine. The Rainbow looks promising under the management of F. D. Mason. W. T. Vaughan, the merchant, is interested in the Rainbow. This mine lately milled 150 tons of high-grade ore in the El Paso mill. C. W. Steward still plugs away at the Arabelle, although almost everybody has abandoned Tomasa mountain as dubious. The Tarantula is worked occasionally by the owners. Several prospectors have started out since the last rain and more are ready when the rainy season fairly sets in. The general opinion is that rich mineral ground will be found to the south. Judge Zazueta and C. D. Lozano have a placer scheme which they will start this week. They will put in a string of sluice-boxes in a gulch at the foot of the Hogback range that divides Alamo from Mexican gulch. The Sheldon Bros. milled a lot of ore last week from the Sunrise which ran \$40 per ton. They have shifts now at work and are going right ahead. The Telemaco will start up this week. The El Paso mill started up Sunday on custom ore. J. Hendershot is taking out ore from the A. H. Butler which runs \$40 per ton.

A RICH SILVER MINE.—Tia Juana is at present considerably worked up over the prospect of the working of a silver mine which lies about 15 miles directly south of that place. The mine is not a new one, but the present development of high-grade ore is unexpected. Some years ago the mine was first talked of, but no paying ore was struck and but little work was done on it. Two years later a prominent mine-owner and prospector from Colorado came here and thought the mine was a good one. He secured a bond on it for \$50,000 and it is understood paid something on this, but died before having a chance to develop the property. Since then the claims have been in litigation in the Mexican courts and some of the natives of that country, living at Tia Juana, have secured a half interest in it. Some little time ago the American who owns the other half interest came here, a man by the name of Smith, and has since then been making careful investigations. He claims wonderful things for his mine. A few days ago he showed a piece of ruby silver, nearly as large as a half-bushel basket, which would run over \$10,000 a ton, and other specimens have also been taken from the mine which run over \$200 a ton. Mr. Smith says that there is a large body of this high-grade ore in sight and that there are now 5000 sacks of it ready for shipment which will run over \$200 to the ton. Mr. Smith is now considering the project of erecting smelting and reduction works at Tia Juana, where it is said the Mexicans interested insist they shall be located.

ALAMO NEWS.—*Lower Californian*, Dec. 25: The camp was never on a more solid basis than now. All the leading mines have been equipped for winter and the rainy season will have to be much heavier than usual to retard operations. The Aurora hoisting works and ore dump are almost finished and are very conveniently arranged. The non-arrival of the Aurora's hoisting machinery and boiler, which are now in Ensenada, have necessitated shutting down the mine and it will not be started up until after the holidays. The Princessa has been compelled to lie idle for almost a week, on account of the capers of the expert blacksmith. The rock in the Princessa is very hard and a blacksmith must understand his business to keep the drills in order. The Ulises, Indian and San David are being regularly worked and all look favorable. Robert Matheson and Jack Lee returned last week from Valladares, where they report the prospects as very good, but not such as to encourage any immigration. They will return shortly. H. S. Sherard is taking hold of the Butler mines and will see what they are worth. The Scorpion is being worked under Frank Phelps. Basilio Padilla, the discoverer of Mexican gulch, is placing there. All the placer men want rain, but otherwise the present weather suits everybody. Col. Lane is getting all the custom ore he can handle. The El Paso is also running on custom rock. The Princessa mill is steadily grinding. J. M. Albright has gone to San Francisco after a 5-inch

Cameron pump to be used on the Montezuma mine, work on which has been stopped on account of water. The shaft on the Montezuma is 40 feet deep and some of the ore that has been taken out is very fine, that from the level on the west side being especially rich and showing free gold. After the pump arrives the shaft will be deepened to 90 feet. A day shift of ten men has been working the Montezuma and they kept the mill supplied with ore.

NEW MEXICO.

PIÑOS ALTOS.—Rio Grande *Republican*, Dec. 27: T. Rouault returned this week from a visit to the mining property near Piños Altos in which he is interested. We understand that Mr. Rouault and Prof. Carrera are loading about seven cars per week with the product of their mine and as soon as more teams can be had will quadruple the shipment. Judging from the number of capitalists in town, we will have a mining or a land boom. We predict both, on the ground that our lands and mines are both rich, and well worth having.

RICH LEAD ORE.—The southern portion of the Organ Mountain Mining District is attracting considerable interest on account of the Herd Bros. striking a big body of ore in the Modoc mine, which will run sixty per cent in lead and not less than ten ounces in silver.

DEVELOPMENTS.—Silver City *Enterprise*, Dec. 25: I can be truly said that the Good Luck mine at Lone Mountain has been from its discovery to date one of the most phenomenal of the many promising prospects ever discovered or opened in this rich mineral-bearing area. The proposition has not only been a paying one from its very inception, but every shovelful of ore has not only been tinged with a dividend but has shown in the footings a tangible result in dividends which have stimulated the owners, Beall & Brockman, to extend developments; in fact the entire camp is solid in mining and financial circles as one of the most inviting silver fields on the continent.

SHAKESPEARE.—Shakespeare is still on the go. The company owning the Alwood mine is erecting a mill on their property, and will soon have a large force of miners at work. They will soon begin boring for water and expect to get sufficient for all uses without much trouble. The Humboldt Co. has been having some trouble, but the matter appears to be settled and the mill is running right along. At the present writing there are between 50 and 75 men at work in and about the camp, with splendid prospects of a large increase in the near future. At Pyramid the Viola Co. is working some 30 men and taking out very good looking ore. They do not intend to start their twenty-stamp mill until they can do so on their own ore. The Last Chance has been leased by Roberts & Leahy and Mr. Bradford, and though not doing much at this time it is understood they will start up soon. Gold Hill is once more in the dumps. The 10-stamp mill is again closed and it is uncertain when it will start up again, though the statement has been made that after the first of the year there will be a new departure and that finances will be forthcoming with which to demonstrate whether there is anything to be made out of it or not.

OREGON.

PROSPEROUS CAMPS.—Baker City *Bedrock*, Dec. 27: Reports from Cornucopia indicate that that camp is in a more prosperous condition than ever known before since its discovery. Extensive mining development work is going on and high grade bodies of ore are being uncovered. Sparta camp has taken on a mining activity that is simply wonderful, and all things indicate that Sparta will make her mark in the near future as a bullion-producer.

GREENHORN DISTRICT.—G. W. Chenoweth, a mine-owner in the Greenhorn district, gives a glowing account of the mines in that section and is of the firm opinion that next year will work an era of progress in mines and mining in this county which will be nothing less than a veritable revolution. He reports development work progressing nicely and the various properties showing up well.

UTAH.

DEEP CREEK ORE.—Salt Lake *Tribune*, Dec. 29: H. J. Faust and Sam Gilson have a splendid display of Deep Creek ore on exhibition at the office of the Salt Lake Abstract, Guaranty & Trust Co. They represent a large scope of mineral-bearing country, and include the Clifton district, the Kinsley, Dolly Varden, White Horse, Furber, Cherry Creek, Duck Creek, Pleasant Valley and Fish Spring districts. The collection will be added to as received. The ores are all rich, and only await the advent of a railroad to be turned into the channels of trade.

SILVER MOON.—A reporter called on the president of the Tintic Mining and Milling Co. this morning and was shown three millruns on Silver Moon ore that are very encouraging. The first from 13,524 pounds of ore went 4 per cent lead, 86.3 ounces silver and .13 ounces gold. The second lot, 14,450 pounds, gave 8 per cent lead, 67 ounces silver and .13 ounces gold; while the third lot, consisting of 16,235 pounds, assayed 18 ounces in silver and .10 ounces gold. The last lot was sent in as an experiment, and consisted of low grade that had been thrown over the dump. These tests were made from ore from virgin ground and were taken from the grass roots. The company will put two shifts of men at work immediately. They have a fine piece of property and will ship from the start.

PARK CITY NOTES.—About 1300 men are employed in the different mines and mills in the Park, and the average daily pay of each is \$3.25. Smith Ehrenreger has just completed a large amount of assessment work on the Dohlberg group for 1890. The Crescent Co. is holding on to its concentrates for a better market. There are 650 tons stored at the concentrator. The Woodside is being worked in both the old and new workings. In the old workings a drift is being run on the vein and ore is being taken out. A drift from the shaft is being run to intercept this one and it is now in 500 feet. The outlook at the Woodside is splendid.

THE SILVER MOON BOUGHT.—Salt Lake *Tribune*, Dec. 27: The Silver Moon mine has been purchased by the Tintic M. and M. Company. The price paid was \$58,000. This with the other mines the company has will give them an ample opportunity of spending some money and making some. A recent test was made of ore taken from the fifty-foot

shaft and was very satisfactory. On 16,235 pounds of argentiferous iron ore the following result was obtained: Silver, 18.4, gold, 1.10. On 14,160 pounds: Silver, 67 ounces, 8 per cent lead, 13-100 ounces gold. On 13,524 pounds ore: 86 ounces silver, 3 1/4 per cent lead, and 13-100 ounces gold.

A BIG DEAL.—A big mining deal is on the tapis in this city. It is being kept quiet just now, but will be a corker when it is let loose.

ORE AND BULLION.—McCormick & Co. yesterday received, Hanauer bullion, \$6800; silver and lead ores, \$5450, total, \$12,250.

GOLD BAR FROM BINGHAM.—T. A. Snell, manager Stewart No. 2 at Bingham, brought in a gold bar yesterday worth from \$500 to \$600. He says there is \$150,000 in gold ore blocked out and ready to break down and ship, and also that the mine has lots of ore that will run from an ounce and a half in gold to five ounces and ten ounces in silver.

WASHINGTON.

THE EAGLE.—Colville *News*, Dec. 25: The passenger on the Spokane Falls & Northern will notice evidences at Chewelah of the untold riches lying underneath the ground in this section, and especially around that particular point. He will notice trains or wagons loaded with ore that will run high in silver patiently awaiting turns at the box cars on the siding, which are being rapidly filled with ore for shipment to Tacoma and other points. Most of this ore comes from the Eagle mine, which is one of the richest and the best developed mines in that district. Regarding this property, a gentleman in this city received a private letter from Supt. Harris, in which he says: "We are sinking a new shaft 250 feet deep, double compartments with cases, and adding new hoisting works. The company has expended about \$45,000 under the grass roots, and everything found has proved that the deeper we go the richer the property becomes. We have just completed a new lodging-house, and are furnishing the miners with beds and bed sets with spring mattresses. From present indications the Eagle will rank well with the best paying mines in the country."

THE WELLINGTON.—W. H. Kearney left yesterday to put a force of men at work on the Wellington, a chloride of silver property on Mineral Hill in the Summit district. The prospect is only four miles from the Daisy and carries a like character of ore as this well-known property. Kearney hopes to make such developments during the winter as will demonstrate the property to be one of considerable value.

THE CROWN POINT.—Oscar Runnels is having development work done on this property which lies in the Trail Creek country. Assays made of the ore run as high as \$250 in gold and silver.

OLD DOMINION continues to look very promising. The ore found in the tunnel is of the same rich class as that above in the shafts and drifts. The tunnel will strike the main shaft 400 feet below the old works. In a few days the tunnel will be completed, and in the language of Supt. Kearney, "the mine will rival the Comstock."

DEAD MEDICINE.—John Keough was in town Tuesday and said he had just finished with the assessment work on this property. The ore is iron and galena. The tunnel is in about 40 feet and only a few feet farther must be gone before the main ledge is reached. The tunnel will strike the shaft 250 feet below the surface.

THE DAISY.—The upper tunnel of this property is 120 feet, from which a shaft is sunk 64 feet, and a raise to the surface made. The Robinson or middle tunnel is 230 feet, which connects with the bottom of shaft. The lower level is 384 feet long, from which a raise is made of 150 feet to the bottom of the old shaft. The lower tunnel cuts the ledge for 150 feet. The main shaft will be 265 feet deep. Over 540 tons of ore have been shipped from a 120-foot stope. There is now ready for stoping 190 feet, which will yield about 750 tons of good shipping ore.

NORTH EXTENSION OF DAISY.—This promising prospect is owned by Joe Horton. A run in has been made of about 25 feet and a 3-foot vein struck, though its position shows it not to be the main ledge which is of the same character and pitch as the Daisy. The ore taken from the vein assays 30 ounces in silver.

SILVER WAVE.—The shaft on this property is at present about 100 feet down. The ore is galena, and the more work is done the more extensive becomes the amount of ore.

THE BONAZA.—Shipping goes regularly on from this property. Cars are left at the siding near the property. The ore goes to Kansas City.

NEW STRIKE.—This property is located on the north fork of Kettle river, and is owned by a Seattle stock company. R. A. Brown, superintendent, was down Tuesday purchasing the last load of supplies for the winter. He is working a full force, and by spring will have the mine in a condition to ship an abundance of high-grade silver ore. Supt. Brown says he will probably be down in March with about \$7000 worth of furs. He is buying for a New York firm.

LEDGE MATTER.—Okanogan *Outlook*, Dec. 27: Billy Hunt and Bob Hargrove are doing some development work on the Eureka on Mineral hill. While doing assessment work on the Orphan Boy last week a fine chute of ore was encountered in the face of the tunnel. James Malone, who was doing the work, notified his partner, Mr. C. F. Grismer, of Tacoma, of the strike, and it is likely further prospecting will be done. The law compelling miners and prospectors to do \$200 worth of work annually, in order to hold mining claims is being pretty generally complied with in this district, this year. Those who are in a position to know say that there are few, if any claims, where the indications would seem to justify, where the proper and required work has not been done, and the claim-jumper will doubtless find his business largely curtailed during the coming winter. Ed. Harvey and H. F. Miller finished assessment work on the Green Horn last Wednesday for Mr. Hinds. In running an open cut about six feet deep across the surface of the ledge they uncovered a pay streak two feet and a half thick of splendid looking ore, and taking into consideration that the width of the ledge as exposed by this crosscut is over 22 feet, it must be admitted that the top showing is an unusually good one, and the general conditions of the formation and character of the ledge matter would seem to indicate a true fissure vein and a permanent ore chute.

MECHANICAL PROGRESS

The Origin of Iron.

The following very interesting discussion on the history and origin of iron was recently published in the London *Mechanical World*:

In treating of the origin of iron, we are not dealing with a complex mineral or other substance which has been evolved out of simpler compounds, and ultimately from its elements, but with an element itself, if we except the impurities which are inseparable from commercial iron. All the same, we hope to show that throughout its geological as well as its metallurgical history, iron has passed through processes of evolution which, if not exactly analogous to that which obtains in plants or animals, is not necessarily devoid of scientific interest.

The latter stages in the production of malleable iron, the rolling-mill, the forge, the puddling furnace and the blast furnace, are well known and understood by readers of this journal. It is when the ore is reached and the geological history of iron has to be traced that the real difficulty begins.

Before dismissing the metallurgical side of the question, a word is due to the curious change which advancing knowledge has worked on the locale of iron manufacturing in our own country. One of the greatest steps in this onward march was the substitution of coal for charcoal in the smelting of the ore. The result of this discovery was that instead of continuing to be carried on in the wooded districts of the southeast of England, iron manufacturing was transferred to the coal-bearing districts of the country, where it has remained ever since.

Passing from the metallurgical side of the question, the first thing that has to be considered on the geological side is the iron, or ironstones. Iron is not only the most useful of materials, but, under one form or another, the most widely distributed.

In all geological formations, it is found both in sedimentary and igneous deposits. It is also found in plants and animals, as well as in water, both sea and fresh. It is only, however, when the proportion of iron exceeds 16 per cent or thereabout that the material is considered an ore of iron, or ironstone. In the great bulk of ores the metal exists in chemical union with sulphur, oxygen or carbonic acid, and while Nordenskjöld describes the occurrence of metallic or native iron in some volcanic deposits in Greenland, the presence of metallic iron, when found in the earth, is usually attributed to meteoric sources.

Iron ores are found as sedimentary deposits, and also as masses and veins. The British deposits, so far as at present worked, belong to the carboniferous age, with the exception of the extensive clay-band deposit of Cleveland, which belongs to a later period, and all are included under the division sedimentary or deposited by water. The deposits known as masses are met with in Scandinavia, Styria and other parts of the Continent, and there are also many examples of this sort in the United States. Masses along with veins or lodes are considered due to the action of heat, and are termed igneous as opposed to sedimentary, and they have been ejected from below instead of laid down from above. Putting all iron deposits under the broad classification of sedimentary and igneous, attention will first be directed to the former of the two.

Sedimentary deposits having been laid down by water, it follows that the water must have obtained its supply from previously existing ferruginous rocks. That many of the pliocene rocks contain iron compounds may be easily proved by examining the exposed sections of the trap rocks, which are scattered up and down the country. While a fresh fracture of these rocks shows the interior to be dull gray or black, the weathered surfaces are often found to be of a rich brown color. This is due to the action of rain and atmospheric agencies washing out the soluble constituents, such as lime, potash, etc., setting free the oxide of iron, which gives the characteristic coloring to the exposed or weathered surfaces. The probability, therefore, is that the sedimentary deposits of iron ore have been derived from the denudation of earlier rocks. The silica of these earlier rocks would be then deposited in one place to form sandstone, aluminium-silicate, in another place to form clay or shale, while the iron, in accordance with its specific gravity, would also be deposited by itself in beds of greater or lesser magnitude, according to the time the process went on. These beds would subsequently become subjected to the pressure of overlying strata, and according as they would be affected by other phenomena, such as heat, infiltration, etc., some of the characteristics would be stamped upon the deposits which are known to distinguish them to-day.

It will now be noticed that this theory of the formation of sedimentary beds allows of the two classes of deposits—so far as further investigation is concerned—being merged into one, and that is the igneous.

To affirm that all the world's iron has been derived from igneous rock is to say that, in one way or another, it has been ejected from the earth's interior, or from some source deep down in the earth's crust. Though circumstances prevent this from being openly demonstrated, there is strong circumstantial evidence

which points to this conclusion, some of which will be briefly noticed.

From several independent observations and calculations, it has been found that the specific gravity of the earth as a whole is about 5.5, while the average of rocks at the surface is rather under half this amount. Some have argued that the increased specific gravity is obtained by excess of pressure, but this view is not generally accepted. From the abundance of iron compounds in the crust, and its apparent derivation from the igneous rocks, together with the suitability of its specific gravity (7.70) for balancing up the deficiency in the surface rocks, it has been argued that an immense store of metallic iron exists in the earth at a certain depth not exactly determined.

The action of the dipping needle, which is always accentuated by an approach to the polar regions, where, presumably, the so-called crust of the earth is thinner, has also been cited as supporting the theory of an internal mass of iron. In the excellent paper by Prof. Rucker on "Underground Mountains," which appeared recently in one of the popular monthlies, allusion was made to the action of deep igneous rocks on the dipping needle as exhibited on the Thames valley. This action was ascribed to the metalliferous nature of these rocks, and as these rocks must have come from below, they may be fairly held as supporting the theory of an internal mass. It might further be pointed out that in the meteorites which occasionally visit our planet, a common constituent is metallic iron, often so pure as to admit of its taking on a brilliant polish. Seeing, then, that metallic iron exists in some extra-terrestrial sphere, which gives rise to our meteoric visitants, there is surely no reason why it should not exist in this state on the earth, and seeing it is not found at or near the surface in this condition (metallic or native), the only other place it can be is deeper down, or, in point of fact, in an internal mass.

Assuming that some evidence has now been adduced to indicate where the world's real iron store exists, a difficulty is encountered in following its passage from the metallic condition to its various forms of combination as found by man. Knowing the readiness of iron to combine with oxygen, sulphur and other elements, about as much as one can do is to imagine varying degrees of temperature and pressure, together with eruptive action, and a long draft on the bank of time to account for the various forms of ores and stones in which iron is now found.

The subject may be further pursued and the question asked, "Whence has the earth all this iron?" Seeing that iron forms such a large proportion of the earth's mass, the answer to this involves the question of the origin of the globe itself.

Hypothesis has been said to be the life of investigation, and so it is now affirmed by the highest authorities that the earth, and consequently its iron, at one time formed part of the sun. In using the term sun it is understood that not only is the sun nucleus meant, but also the deep covering of incandescent vapors which surround it, and which, for convenience, may here be termed its atmosphere.

The labors of Kirchhoff and Bunsen, with the spectroscopes, have revealed in the sun no fewer than 25 elements, all of which are known among things terrestrial, and there is every reason to believe that the remaining elements either existed at a former period, or exist now, in the sun. Among the metals discovered in the sun's atmosphere is iron, and, in consequence of the enormous heat, it, along with the other metals, is in a state of vapor.

Not only is the presence of iron unmistakably made out, but its position among other metals is just where it might be expected, having respect to gravity and the atomic weights which these metals are known to possess on the earth. The study of other metals in the sun, as revealed by the spectroscopes, goes far to support the hypothesis of the earth's solar system, but is beyond the scope of the present paper.

The subject of iron must ever be an important one in a country whose prosperity depends so much upon it, and the various metamorphoses through which it passes before it can form a part of a mechanical structure, should be of interest to every one who wishes for the continuance of our commercial prosperity.

A GREAT FEAT IN METAL WORKING, according to the *American Manufacturer*, was recently accomplished at the Saperior mill in Allegheny, Pa. The feat consists of rolling a strip of steel for a spring six inches wide, one-quarter of an inch thick and 310 feet long. This work was successfully performed and the spring properly tempered at the first effort. That establishment has since received a large order for such springs, which are designed to enter into the construction of a new car motor, for which a great demand is anticipated. The order had previously been tendered to all the large English and continental works of Europe, none of which would undertake to do it.

AN IMPROVED BUNSEN BURNER.—Carl Meissner, Leipzig, says the *Gas World*, makes a new patent form of Bunsen burner. The tube of it can be screwed up or down. When it is well down, nothing goes up except gas from a conical nozzle. When it is high up, a good deal of air goes up with the gas; and thus the flame can be regulated. The aperture at the top is not round, as usual, but star-shaped; and thus the flame can be lowered to a very small size without striking back.

SCIENTIFIC PROGRESS.

The Language of Monkeys.

Prof. R. L. Garner, honorary curator of the Smithsonian Institute of Washington, is engaged in a very interesting inquiry in regard to the language of monkeys. Do they have a language, and can it be interpreted as to be understood by man? He describes his object and method of inquiry as follows:

"My purpose in the experiments I am making is to obtain an analysis of the language of monkeys that will enable me to make out some sort of rude vocabulary of their tongue. This accomplished, I am sure that I can establish communication by words with them, so as to effect an interchange of ideas. In fact, I can see no reason why a man and a monkey should not eventually converse together, the one requisite being that the man shall be acquainted with the monkey's speech. The latter is exceedingly simple, and the key to it once obtained, most easily learned. It can hardly be expected of the monkey that he shall acquire human language.

"It is with a view to getting hold of this key to the simian tongue that I am taking advantage of every opportunity to procure records on phonograph cylinders of sounds uttered by monkeys. I find on all sides a most cordial sympathy with the inquiry I am making in this new line of scientific investigation. The idea is entirely original with myself, but my belief is that the study of the languages of the lower animals is a field that will before very long attract an army of workers.

"Already I can make a capuchin monkey understand two words wherever I may meet him. One of these words is 'milk' and is uttered by all of them, so far as I have been able to discover, in precisely the same way. On approaching any strange capuchin for the first time I salute him with the term, which invariably procures his attention and good-will. The word in question, however, belongs only to that one species. For you must understand that different varieties of monkeys employ vastly different languages, the speech of one variety being as little known to another as is the case among tribes of men. So far as I can find out, none of the lower animals has a range of more than ten or twelve vocal sounds, but these, being simply interjectional, may be so modified by enunciation as to make nouns and verbs. Apparently the monkey has forty or fifty words effectively at his command.

"I find that I can communicate to the capuchin the fact that I am in pain, and can make a slok capuchin understand my sympathies with his suffering. It is almost impossible to give in printed letters illustrations of the vocal sounds of monkeys, inasmuch as they are nearly all vowels. It can be said, however, that the sounds are strikingly like those uttered by human beings as the expressions of similar emotions. The vocal organs in the lower animals are comparatively rudimentary, but development follows use and effort. All the words that a monkey needs he has at his command. Incidentally to the modern advancement of the human race, thousands of words have been added to our own speech which were not needed by our early progenitors. You will find certain tribes of men described by the Greek writer Strabo who 'had no language, but shrieked like wild beasts,' only uttering very few sounds.

"As for paleolithic man of hundreds of thousands of years ago, there are many scientific authorities who assert that he was actually a dumb creature—as dumb, that is to say, as the monkey is now. It is readily observed that those animals which have been associated with man for many generations are capable of producing many more vocal sounds than others of like species which have not enjoyed the same advantage. For example, the domestic cat is decidedly superior in this respect to any other beast of the feline genus. The reason for this is found in the change of environment and association with multiplied ideas, increased wants, etc.

"Low down in the scale of animal creation you discover that signs are altogether employed as a means of communication. This is exemplified by insects, fish and reptiles. Among other things, they readily understand any threat of attack made by their own species. I myself have noticed that common red ants make use among themselves of signs which they readily interpret.

"I am unable to say with any degree of certainty what variety of monkey is the most intelligent, but I am inclined to think—though this belief, founded upon observation, is greatly at variance with the popular idea—that the most intelligent specimens are found among the smaller species and generally among those with tails instead of otherwise. My study of the chimpanzee disposes me to surmise that its intelligence less closely resembles that of man than is the case with some of the smaller monkeys.

"It was only recently that the idea of using the phonograph to obtain records of monkey vocal sounds for study occurred to me. Through its aid I hope to be able within a year to go a long way toward making out a vocabulary or simian language, which will serve as a beginning in establishing intercommunication. You must not imagine that I propose to demonstrate the possibility of converting the monkey into a man. The monkey will always remain a mon-

key, but it may be that, by long-continued breeding and educating, a race of monkeys very far superior to any at present existing can be produced. When a means of conversing with the monkey has been secured, it will be time enough to think of the intellectual and moral development of our arboreal cousins."

A PEEP AT THE SECRETS OF LIFE.—One of the most interesting objects for examination under the microscope is *Valineria spiralis* (the grass which grows in aquariums) when prepared to show cyclosis or circulation of the protoplasm. Prof. Lookwood in the *Microscope*, says: "I think that, to the amateur at least, a hint how to observe the circulation of this favorite plant to the best advantage must be acceptable. I have never seen it better displayed than when under the excellent manipulation of Mr. F. W. Devoe of the New York Microscopical Society. Having selected a bit of leaf, not too mature, he shaves off one side with a sharp knife, although a razor is better. It is then put on a slide, the shaven side up. A drop or two of clean water and a cover glass of medium thickness, with good illumination, follows, Mr. Devoe using a prism illuminator. Begin the examination with a six-tenth inch objective, and continue up to a sixth or a tenth. The result will be a vision of startling clearness. The vivid individuality of each bioplasmic molecule, and the mystic, almost solemn movement of this pellucid stream of infinities of life, form a sensational picture of which the beholder never tires."

AN INTERESTING EXPERIMENT WITH A LUBRICANT.—The experiment referred to was undertaken by G. W. Bissell for the purpose of determining the variation of the coefficient of friction of a lubricant, the rate of feed of the same to the journal being varied and all other conditions constant. The temperature was maintained constant by circulation of water through the brasses of the Thurston railroad-lubricant testing machine, which was used in the experiments. Tests were made with loads of 2000, 3000 and 4000 pounds on the journal, corresponding to about 70, 105 and 140 pounds per square inch. The results indicate that with low rates of feed the effect of pressure on the coefficient of friction is practically nil, which would tend to prove that under such conditions lubricating rubbing surfaces follow the laws of solid or "immediate" friction; but at the rate at which this state of affairs begins to be apparent, the augmentation of the coefficient is dangerous to the continuance of the smooth running of the journal. It is unsafe to reduce the rate of feed below .003 c. o. per square inch of projected area of journal per minute.

PLANTS AS REAGENTS.—From the results given it appears that by means of beer yeast it is possible to recognize the presence of 0.0005 gm. of phosphate in one liter of water, which corresponds to 5-10,000ths of the weight of the liquid. But agricultural plants are also reagents of an extreme delicacy and accuracy. The author gives as an example the sugar cane, the dominant food of which is calcium phosphate. With the complete manure the cane gives a harvest of 57,000 kilos. per hectare. If we omit the phosphate, the yield is only 15,000 kilos. Hence 600 kilos. superphosphate, containing 90 kilos. phosphoric acid, determine an excess of crop of 42,000 kilos. per hectare, which represents 70 times the weight of the phosphate and 466 times the weight of the phosphoric acid. If referred to the 4,000,000 kilos of vegetable soil covering the surface of a hectare, the phosphate represents less than 1-6,000 part of the weight of the soil and the phosphoric acid less than one forty thousandth. The author, George Ville, hopes to fix the limits of this method.

AN AUTOMATIC ELECTROMETER.—The Meteorological Observatory of the Massachusetts Agricultural College has recently received a delicate apparatus for keeping a continuous record of electric potential of the atmosphere. It consists of an automatic electrometer, the ordinary water-drop apparatus for picking up the air potential, and a photographic registering apparatus. This consists of a cylinder operated by clockwork and carrying the sensitive paper on which a spot of light is focused from the mirror of the electrometer. The arrangement enables a perfectly continuous record of the potential variations in the atmosphere to be kept.

THE WONDERS OF NATURE.—Certain worms similar to the tubific multiply by producing new parts. There is one form, known by the quaint name of Nais, which will develop in the midst of its own body a second head, and just in front of the new head a second tail. Thus there come to be, as it were, two worms joined together; the front one has the old head and a new tail, the hind one a new head and the old tail. By and by the companions separate, and the parent body is thus transformed into two complete animals.

ANOTHER ELEVATED ASTRONOMICAL STATION. An important astronomical expedition has just been sent out by Prof. Pickering from the Harvard Astronomical Observatory. The party will go to Peru to observe and photograph the stars and determine their relative brightness. A new station will be founded near Arequipa, Peru, about 8000 feet above the sea level.

USEFUL INFORMATION.

WIRE NAILS FROM STEEL PLATE.—A Pittsburgh iron and nail manufacturing concern has fitted up an attachment to its steel-plate nail-mill, by which it is claimed wire nails can easily be made. Hitherto this has been regarded as impossible, but a reporter of the *Western Manufacturer*, who witnessed the operation of the new device, was enlightened as to the process, and thus describes it: One of the long row of nail-plate machines, out of scores now standing idle, has been fitted with the new arrangement. The self-feeder has been removed, and in its place is substituted an ordinary wire-nail machine feed, operating from the left side. The head-plate, gripping and heading die remain as in the old machine, but from the clamp at the back is attached an arrangement for cutting and pointing the wire, similar to the manner in which this process is done in regular wire-nail machines. It is said the adapted machine turns out perfectly formed nails at the rate of 250 a minute; that the heading die performs its work better than that of the regular wire-nail machine. The heading arrangement of the latter works from above, and fashions the heads with a quick blow. The heading die of the transformed nail-plate machine works from the right-hand side, and works the heads with a more gradual motion. The nails are seemingly thoroughly well made, well pointed, and with large heads, and without any indication of splitting. By changing the space block, 4, 6, 8 and 10-penny sizes can be made. The alteration of the plate-nail machine to the wire-nail producing form is quite simple and can be done in 30 minutes, and its capacity for wire nails is said to be from 40 to 50 per cent greater than the ordinary wire-nail machine.

A RUSSIAN FIRE-PROOF PASTE.—Still another process for fire-proofing combustible materials is reported as having made its appearance, this time in Russia. The medium is described as a paste, the invention of a poor school-teacher, and is said to have been tested recently with most gratifying results by the Moscow Imperial Society of Agriculture. A shanty was built entirely of straw, and after being covered with the paste, was subjected to a hot fire, when the straw merely changed from a yellow to a reddish-brown color without igniting or even cracking. The Imperial Society has, it is stated, decided to introduce the use of this new invention throughout the empire, considering that it will prove of the highest value in villages where the houses are, as a rule, thatched with straw, and where fires once started, frequently make a clean sweep of the place. The cost of the preparation is spoken of as being very small, and should this youngest-born protector against the flames prove to be all that is claimed for it, it will deservedly take rank as a most useful invention, but the experience of Americans with the dozens of so-called fire-proofing liquids and processes for fire-proofing wood which have been advertised and hawked about within the last generation or two does tend to make them rather skeptical about the true inwardness of such tests as that described.—*Fire and Water*.

KEEPING WALLS DRY.—In a recent issue of the *London Architect*, W. L. Dearborn explains Sylvester's process for keeping walls dry. It consists in using two washes or solutions for covering the surface of the walls—one composed of castile soap and water and one of alum and water. The proportions are three-quarters of a pound of soap to one gallon of water, and half a pound of alum to four gallons of water, both substances to be perfectly dissolved in water before being used. The walls should be perfectly clean and dry, and the temperature of the hot air not above 50 degrees Fahr., when the compositions are applied. The first, or soap wash, should be laid on when boiling hot, with a flat brush, taking care to form a froth on the brickwork. This wash should remain 24 hours so as to become dry and hard before the second, or alum wash, is applied, which should be done in the same manner as the first. The temperature of this wash when applied may be 60 or 70 degrees Fahr., and this also should remain 24 hours before a second coat of the soap wash is put on. These coats are to be applied alternately until the walls are made impervious to water. The alum and soap thus combined form an insoluble compound, filling the pores of the masonry, and entirely preventing the water from entering the walls.

A FIREMAN'S ELECTRIC HAND-LAMP is being introduced in England. The battery and lamp are contained in a copper case similar to a fireman's ordinary lamp and fitted with a handle for convenience in carrying. Very powerful parabolic reflectors are provided, and the lamp, which has a duration of from two to three hours, after which it can be easily recharged, forms an important adjunct to the outfit of the fire brigade. The lamp is also suitable for use in mines, gas works, gunpowder and chemical factories. The advantages claimed for it are portability, facility in charging, capability of resting the battery when the light is not required, and extreme safety.

THE LABOR PROBLEM IN ENGLAND.—The London Chamber of Commerce has proceeded in an extensive way to deal with the labor

problem. A conciliatory board, consisting of 24 members, is to be appointed and afterward kept up by election. The members are to be one-half selected by the employing interest and the other half by the employed. A long code of rules for procedure has been drawn up and the chances are that if perfected, this scheme will result in a still more extensive "court" of a permanent kind founded under acts of Parliament. This, at last, looks like some light on a problem that must soon be dealt with in some way there and elsewhere.

SHOP NOTES.

NEW STYLE OF FLY-WHEELS.—A novel fly-wheel of large dimensions, which differs materially in construction from those ordinarily in use, has been designed by Messrs. Mannesmann, to guard against the terrible danger of bursting, to which accident cast-iron fly-wheels are only too subject when worked at a high speed. This wheel, which is in operation at the Mannesmann Tube Co.'s works, in connection with their process for making seamless tubes, consists of a cast-iron hub, to which are securely bolted two disks of steel plates, about 20 feet in diameter. Round the periphery of the wheel thus formed, about 70 tons of No. 5 gauge wire are wound, under a tension of about 50 pounds, thus binding the whole securely together. There can be no comparison between the resistance of a wheel so constructed to the centrifugal force and that offered to this force by a cast-iron one. This fly-wheel of 20 feet diameter and weighing 70 tons, revolves 240 times per minute, therefore the periphery of the wheel has a speed of 2.85 miles per minute, or nearly three times the speed of the Flying Dutchman. It works on the main shaft from which the tube mill is driven by means of helical toothed steel wheels.—*Specialties*.

WINDING WIRE SPRINGS.—In winding an open spring of wire all that can be calculated on its reflex force after being "shut," or compressed, are the elements of material of the wire, temper of the wire, size of the wire and diameter of the coil. These calculations are easily made, or so nearly that any error may be easily rectified, if the spring should not prove yielding enough, by stretching its coils apart. But a close spring is a different matter. In this there should be more than a closeness of coil; it is requisite that the closing-up inclination of the coil should be greater than the opening resistance, in order to get the greatest power from the spring. This condition may be obtained by holding the winding wire back toward the winding end, even if the leader is "off" from the open end, if the wire is strong enough to sustain the tension, as the result will be an apparently open-wound spring, that is, a closely coiled spring as soon as the end is released. To increase the intensity of a spiral spring (close wound) the wire should be twisted in the winding, the direction of the twist being against the line of the pull on the wire.—*Scientific American*.

INCREASING THE WEIGHT OF TOOLS.—A few years ago there was considerable argument in favor of largely increasing the weight of machine tools, but little seems to have come of this argument. It is safe to say that nine out of ten machine tools on the market to-day are lighter than they should be for the best economy, but builders will go on building light, weak tools because they will sell. When it comes to putting \$50 more stock in a lathe, for example, the question of getting paid for the extra stock is, in these times of close competition, a very important one. When purchasers are willing to pay for heavy tools they will find builders willing to make them. But the demand must precede the supply. When it comes to getting hard work out of a machine tool, ten per cent extra cost does not amount to much, but when it is a question of selling a tool that costs ten per cent more than another, it is uphill business. The manufacturers of machine tools must look at the commercial side of the matter, to the exclusion of other considerations.—*American Machinist*.

HOW TO CLEAN GUMMY MACHINERY.—The simplest and most efficacious method of thoroughly cleaning the various parts of machinery that have become gummed and dirty by the use of fat oils, for lubricating purposes, is by using a strong soda lye. For each 1000 parts by weight of water take about 10 or 15 parts by weight of caustic soda or 100 parts ordinary soda. Let the solution boil and enter the parts to be cleaned; either boil them in this lye or let them steep in it for some time. All the dirt and oil resin is completely dissolved thereby, and it remains only to rinse and dry the parts. The action of the lye is such that it enters into combination with the oil and forms soap, which is readily soluble in water. In order to prevent the hardening of the lubricant on the machinery parts, it is only necessary to add about one-third kerosene. An occasional lubricating with kerosene alone is to be recommended.—*Glasgow Engineer*.

TO AVOID CALLOUS HANDS IN THE SHOP.—A writer in one of our exchanges says: The callousness of the hands of iron-workers may be avoided very easily. Take the average water pail, twelve quarts, fill with soft water five hours before quitting time, noon and night; add two ounces of borax, two ounces of

sulphate of soda. Lather the hands well with brown soap, and then fill the hands with white or any fine sand, and wash thoroughly in the borax water for five minutes or more. Beginning before the hands have become horny, once a day (at night), with one-fourth the chemicals, the smith's hands can always be kept in good, pliable condition, and joint cracks avoided.

ELECTRICITY.

A SINGULAR USE OF ELECTRICITY.—Perhaps one of the queerest applications of electricity to the useful arts is its employment in the hiving of bees when they swarm. The old-fashioned way of accomplishing this interesting feat of domestic economy was, if not absolutely dangerous, quite annoying and provoking. A German scientist, of a practical disposition, conceived the notion of utilizing the electric force to stupefy, without injuring, the bees for a short period. The plan was found to work like a charm. It was first tried upon bees that had gathered upon trees. Whether the cluster was large or small, the result was perfect. The bees fell upon the ground in a trance, which admitted of safe handling. The next stage in the experiment was to capture the bees when they were about to swarm. By introducing the ends of two conducting wires into a fully coupled honeycomb, and turning on a mild current for an instant, the insects were rendered inactive for about 30 minutes. Bee-raising and the production of honey are yearly becoming a greater industry in this country. Parties interested in the business should test the German method of hiving bees by electricity. They may apply too strong a current and lose their bees, but they will gain in science, which ameliorates all small disasters in this progressive age.

HOW AN ELECTRIC CAR IS MOVED.—The dynamo which generates the current does so by the revolution of a coil of wire near the poles of a magnet, the force which revolves the coil being derived from the engine. The current then passes over the wires, down the trolley which surmounts each car, to a small motor. This motor has an armature consisting of coils of wire traversed by an electrical current, which is attracted in succession to the poles of the stationary coils called the field magnets, through which the current also flows, flies around, and transmits its motion, by means of cogwheels, to the axle of the car. The driver of the car, by the use of a lever turns the current into the motor beneath the car or diverts it to the rails at will. In the conduit system the current passes along the wire, with which connection is made into the motor on the car, and then out through the wheels to the rails, and then back to the central dynamo.

WIRE AND ELECTRICITY.—Electrically heated flatirons are now made which are very serviceable. The flatiron is of the usual form, but made hollow. The interior contains a lot of coiled wires, through which the electrical current passes and heats the wires red hot. The latter are arranged between protecting sheets of mica and asbestos. You turn a switch, and the flatiron at once heats up ready for use. The street wires supply the electrical current. In the same way all kinds of domestic utensils may be heated, such as cake-bakers, meat-broilers, coffee-pots, etc. Electrical platters for keeping food warm when on the table may be had. Electrical heaters for warming apartments are also made. There is, indeed, no end to the useful applications of wire and electricity.

LOCAL INTERESTS IMPROVED BY ELECTRICITY.—Electricity is doing more for the country towns, says the *Pittsburg Dispatch*, than all other agencies combined. It is lighting villages that would otherwise be groping in the dark, for gas corporations do not settle in such places. The game is not big enough. But the greatest thing electricity is doing for the small towns is the running of the street cars. This has given them a forward impetus that has been of immense benefit to all of their business interests. A great deal of the vim and push seen in Western Pennsylvania towns is due to electricity.

ELECTRICITY VICTORIOUS.—The Paris Gas Company is said to be the first of the important European gas companies that shows a visible decline distinctly due to the increase of electric lighting. The decrease for August and September of the present year, as compared with the same months last year, is respectively eight and six per cent.

MAKING METALLIC WHEELS BY ELECTRICITY.—A patent has been granted to the Bettendorf Brothers, of Davenport, Iowa, for an improvement in the manufacture of metallic wheels, by which the spokes are welded to the hub and tires by means of an electric current passed through the parts during the welding operation.

FELLING TREES BY ELECTRICITY.—In the forests of Galicia an electrical tree-feller has been introduced with success. The saw is actuated by an electric motor, to which the current is conveyed by conducting wires from the nearest generating station.

THE TELEPHONE PATENT.—The English telephone monopoly has come to an end, as the English patents expired Dec. 9th. The Bell patents in this country have still three years to run.

GOOD HEALTH.

ELECTRIC PROSTRATION.—"Electric prostration" may be called a new disease. It troubles workers under electric light. Severe cases are reported from Creusot, France, where an electric furnace is used for quickly heating metals. The light exceeds 100,000-candle power, and the men suffer from it and not from the heat. After one or two hours the workers have a painful sensation in the throat, face and temples, the skin becomes copper red, and an eye irritation begins that lasts 48 hours, the discharge of tears being copious. After five days the skin peels off. Dark-colored glasses somewhat mitigate the effects of this tremendous light, but not entirely. *Per contra* to the above, it is said that electric-light men are never troubled with rheumatism, says a local paper. The stiff-jointed portion of humanity hover around the dynamos in the Brush Light Company's works just the same as consumptives seek a slaughter-house for the blood of a freshly-killed bullock. "Why, people would be hanging around our dynamos all day if we permitted it," said Superintendent Law. The discussion upon the subject of electricity as a curative agent in certain chronic cases, notably rheumatism, has excited much interest among electricians and classes of workmen engaged in handling heavily charged wires. Numerous cases are cited in different parts of the country to prove that men engaged in these employments are free from all rheumatic and neuralgic troubles.

CREAM AS A CURE.—Very few housekeepers know the value of cream as food, and its superiority over butter or any other solid fat by permitting the gastric juice to mix with it in the most perfect manner, and in this way aiding and hastening digestion. It is most invaluable in the case of invalids, for it serves as nutriment in the most readily available form. It is also superior to butter, because it contains more volatile oils than butter made from it. Persons consumptively inclined, those with feeble digestion, aged persons, and those inclined to chilliness and cold extremities, are especially benefited by a liberal use of sweet cream. No other article of food or medicine will give such satisfactory results. It is far better than cod-liver oil, and is an antidote against consumption and a nutritious food for any one at all times. It would probably be used very freely were it not for the impression that it is an expensive luxury, and for this reason we restrict ourselves in the use of cream, and use butter, a still more expensive luxury, lavishly. The impression seems to be that the legitimate end of cream is to make butter, while, in fact, butter-making is the least useful purpose for which milk is employed.

A RIVAL FOR DR. KOCH.—A telegram of December 25th states that a consumption cure introduced by Dr. Shirley of Detroit, is attracting much attention among physicians. Dr. Ingalls of Chicago has inoculated several patients with it. In a recent interview he said no immediate effects are noticed in this treatment, but Dr. Shirley has dismissed several of his Detroit patients apparently cured after four months. The remedy consists of hypodermic injections of a solution of chloride of gold and soda, or a solution of iodine. These drugs have long been used for consumption, but never in this way before. The cure is a blood cure and of course it takes some weeks to have any effect. The remedy is injected much as the Koch lymph is, but its nature and effect are very different. It is an alterative and does not, like lymph, attack and destroy the disease tissue. Its effect is to change the nutrition of the tissue and not destroy it. It is therefore much milder than lymph, and its use is attended with no languor.

ELECTRICITY FOR A FELON.—The capabilities of electricity as a remedial agent have just received a new illustration. A man with an aggravated case of bone felon on the thumb consulted a physician, and was told that several months would elapse before he could use his hand. In his dilemma, he sought the advice of a physician who had done some excellent work by means of electricity. The physician operated on the diseased member with an electric battery, and the pain, which had up to that time been intense, ceased. In four days the patient was at work again. The operation was a pronounced success, and a perfect cure was soon effected.

A NEW DISINFECTANT.—A London contemporary says: "Since we have learned to be terrified by the ubiquitous microbe, means for combating him have multiplied and flourished. The latest disinfectant is called 'lysol,' and appears to be our old friend carbolic acid emulsified, and thereby made more active. The emulsifying agent is an ordinary fat or resin soap, but the peculiarity of manufacture lies in the fact that the tar acid is incorporated with the soap at the moment of saponification. The customary proofs of efficacy are forthcoming, and duly chronicled in the German edition of the proceedings of the British Association, which have recently been issued at Bremen."

THE LYMPH NOT DANGEROUS.—Dr. Koch, in a recent conversation with the municipal authorities of Berlin, denied that his lymph was in the smallest degree dangerous to life, providing it was employed in reasonable quantities by skillful physicians.

Passing Events.

There are indications of a revival of interest in the mining region of the northwestern part of this State, where there is plenty of auriferous gravel as yet untouched. The surface placers are pretty well worked out in these days, but deposits suitable for drifting and hydraulicking are yet to be had. In fact, it looks as if blue gravel in extensive deposits will yet be mined.

The rain of this week was of great benefit to the State and appears to have been pretty general.

An electric road is shortly to be built in this city, another at Oakland, and the plant for another has arrived at Sacramento. In the Eastern cities these roads are quite common, although there is a general desire for a successful system which will do away with the overhead wires.

With this number of the PRESS we commence a new volume, and it is a good time for our friends to suggest to others that they shall become subscribers to the oldest mining paper in the United States.

A STATE MINE CONVENTION is being held at Cheyenne, Wyoming, and a display of minerals is being made.

Mineral Zone or Lode.

A very important mining suit is now in progress in Los Angeles, entitled Doe vs. the Waterloo Mining Co., or in reality, the Oriental and Red Cloud mines vs. the Silver King, in Calico district, San Bernardino Co. The suit involves the question of lode or mineralized zone as opposed to separate veins. A zone or mineral body exists in which are numbers of lodes or veins, and the suit is to determine whether these are separate and subject to separate location, or whether they simply form parts of one mineral zone. The occurrence is at the contact of a volcanic tuff and a trachyte or a liparite. The character of the ore is a heavy spar, carrying chlorides and bromides of silver and occurring in numerous fissures in a limited zone.

Both mines are being worked. The side line of the Silver King claim runs through the belt lengthwise, so that the Oregon No. 2 claim has within its surface boundaries one or more of the veins of the system.

The suit has been on trial about six or seven weeks. The lawyers are Messick and Perkins for Mr. Doe and W. F. Herron and A. H. Ricketts for the Silver King (defendants). The mining experts for the plaintiffs are Messrs. Louis Janin, Francis Reed and Wm. Edwards. Those for the defendants are Wm. Hayes Hammond, Wm. Irelan Jr. and Ross E. Browne. The case is a very important one, as it considers the lode question in a similar way to the famous Eureka-Richmond case, although the formation is different.

As in that case the principal inquiry is to ascertain the character of the zone, in order to determine whether it is to be treated as constituting one lode, or as embracing several lodes, as that term is used under the Acts of Congress of 1866 and 1872, under which the parties have acquired whatever rights they possess.

In Judge Field's decision in the Eureka case he held "that the Acts of Congress were not drawn by geologists or for geologists; they were not framed in the interest of science, and consequently with scientific accuracy in the use of terms. They were framed for the protection of miners on the claims in which they had located and developed, and should receive such a construction as will carry out this purpose. The use of the terms *vein* and *lode* in connection with each other in the Act of 1866, and their use in connection with the term *ledge* in the Act of 1872, would seem to indicate that it was the object of the legislator to avoid any limitation on the application of the Acts, which a scientific definition of any one of these terms might impose.

"It is difficult to give any definition of the term as understood and used in the Acts of Congress which will not be subject to criticism. A fissure in the earth's crust—an opening in its rocks and strata made by some force of nature, in which the mineral is deposited, would seem to be essential to the definition of a lode in the judgment of geologists. But to the practical miner, the fissure and its walls are only of importance as indicating the boundaries within which he may look for and reasonably expect to find the ore he seeks. A continuous body of mineralized rock lying within any other well-defined boundaries on the earth's surface and under it, would equally constitute, in his eyes, a lode. We are of opinion, therefore, that the term as used in the Acts of Congress is applicable to any zone or belt of mineralized rock lying within boundaries clearly separating it from the neighboring rock. It includes, to use the language cited by counsel, all deposits of mineral matter found through a mineralized zone or belt coming from the same source, impressed with the same forms and appearing to have been created by the same processes."

In the Eureka decision quoted, Judge Field, after referring to the opinions of experts, says that these gentlemen carried in their minds the scientific definition of the term lode as given by geologists—a fissure in the earth's crust filled with mineral matter—and disregarded the broader though less scientific definition of the miner, who applies the term to all zones or lodes of metal-bearing rock lying within clearly marked boundaries. It was his opinion that the Acts of Congress used the term in the sense in which the miners understand it.

In the case now in progress in Los Angeles, involving title to valuable property, one side is trying to prove to the court that the ore is on a

single mineral-bearing zone in which there are numbers of lodes or ledges all belonging to the same deposit, while the other side is endeavoring to demonstrate that each of the ledges or lodes is a separate and distinct one having no special relation to the zone as a whole. The decision will be watched with interest. Numbers of drawings, sections and plans of the mines have been made to demonstrate to the court the points involved. At the conclusion of the case we shall present to our readers such details as will be of general interest to the mining community.

Undeveloped Resources.

The natural resources of the State of California are great and exceptionally varied. The mineral domain is extensive and embraces a large number of substances of economic value. The agricultural and horticultural features are excelled by no other section of the Union. Yet there is room for development of these resources in all directions.

In whatever county one may go there are pointed out opportunities for investment, and those familiar with the locality can show where only capital is needed to develop some natural resource. In fact, many of us do not realize the value of things familiar to us, and our local capital does not seek, but needs to be sought.

We need a class of capitalists here who are investors rather than lenders of money. Men who start new enterprises and need capital are unable to find men to invest money in them, although with suitable security cash can be obtained. In other and larger centers of population, upon a proper showing, money can be obtained for direct investment in an enterprise, the capitalist depending upon legitimate profits rather than upon cent per cent interest.

As population increases in California and new men come among us, our undeveloped resources will be recognized and utilized as in other parts of the Union. Capital seems to center too much in the cities and remain in the cities. It seems difficult to attract it to any distance. Yet all the interior counties afford abundant opportunity for legitimate investment. It is to be regretted that our capitalists do not go further afield and assist to a greater extent in opening the material resources of the State.

African Gold Mines.

In another column will be found a memorandum of the terms and conditions upon which persons are permitted to prospect for minerals and metals in Mashonaland, Africa. This is a new country now being opened up. It lies some distance north of Kimberley, but is only about 300 miles from the east coast of Africa. The British South Africa Co. is a company chartered by the English Government. The quartz reefs found are to be operated by the prospector on joint account with the company, but the company claims no rights in respect to gold found in placer mines. It will be noticed that a certain amount of work must be done in the quartz claims, a 30-foot shaft being necessary within four months of registration. This rule is to insure development and prevent ground from lying idle.

From a private letter from Kimberley to the editor of the PRESS, it is learned that fairly good reports are coming in from the front. There are now some 600 or 700 men in Mashonaland. Quartz reefs are known to exist and will be thoroughly tested; and if placer diggings are struck there will be a "rush."

Mafeking, the starting-point for the new mining region of Mashonaland, is 100 miles north of the terminus of the railway, which is now at Vryburg. The latter town is about 150 miles north of Kimberley, which itself is 647 miles from Cape Town. The distances from Mafeking are given in the notice in another column. The name of the secretary of the company is also given, and miners on the Pacific Coast who have an eye on African gold fields may write to him for further information.

THE LEAD TRUST.—It is said on Wall street that the recent large transactions in the Lead Trust have been accompanied by a large increase in the number of transfers on the books, indicating that much of the stock purchased has been taken up and paid for by investors in anticipation of a favorable statement and dividend, which it is believed will be made in February.

The San Francisco Cancer Remedy.

It is a Cure and not a Mere Extirpation.

The world-wide excitement attending the recent discovery of the Berlin consumption cure seems to have awakened a new and most active interest in the claim which for three or four years has been made that a well-known practitioner in this city, Dr. C. A. Cook, has discovered a cure for cancer. It has long been fully believed by all who have made any effort to examine into the facts connected with this alleged cure that it is a reality, that it is a genuine cure and not a mere extirpation—a rooting or ontting out.

Physicians of all countries, and numerous uneducated "specialists," as they are pleased to call themselves, have from time immemorial cut out cancers or drawn them out by means of "plasters," sometimes, indeed, in very mild or doubtful cases of this malady such practitioners may have dissipated or "soattered" cancerous tumors by outward applications without the aid of either knife or plaster. Cases of a similar nature are on record in medical books, where what were supposed to be cancers have gradually disappeared from the system without any special treatment. Such "onres," however, have been attributed to the action of nature operating on unusually healthy systems, when the patient has followed a careful system of diet, etc. Nature often works wonders in disintegrating and driving from the system foreign bodies, or broken-down tissues and even fragments of bone—and thus, for ages, cancers have sometimes thought to have been "cured." But until our attention was called to the practice of this San Francisco specialist, the writer has never heard of anything which could be considered a "specific" for cancer. So much interest is just now being taken in regard to this matter, that we feel it is due to the public to give some information as to

The Character and Method of the New Treatment.

This new treatment has no need for the knife, and only in a few exceptional and mild cases is anything like a "plaster" used. Even when the latter is used it is not compounded with the severe caustics usually employed, but nevertheless does its work in a manner equally effective and with very little torture to the patient. But, in all cases, what are denominated "specifics" are employed, which act gently and without giving pain. In fact, the action of the specific assuages the pains which always accompany the growing tumor immediately upon their application. They moreover destroy the offensive odors which are nearly always attendant upon advanced cases. No minerals of any kind are employed in any part of the curative process. Every particle of the several motions and other compounds is either vegetable or animal.

This "onre" was not an accidental discovery, but consists of an elaborate treatment which has been evolved only after long years of careful study and experiment. Starting some 20 years ago from a mere germ, which was obtained for coin, the remedy has been worked until it has now assumed a well-perfected specific for this most dreaded of all maladies with which the human race is afflicted.

The Remedy is Simple as Well as Efficient.

Different from the idea of Dr. Koch, whose consumption remedy proceeds with violent and often dangerous action from the extremes or periphery of the body—the skin—through hypodermic injection under the skin, the constitutional portion of this cancer treatment is simply an alternative of pleasant and quite attractive taste introduced into the stomach—the fountain-head of nutrition, and thence, through physical movements, modifies and controls all the vital machinery of the system—absorption and nutrition—and in a way so vigorous and beneficent that morbid actions are forestalled and physiological ones so energetically and triumphantly substantiated, that, with the aid of the outward applications and the active endosmose action set up by use of the battery, every cancerous germ is not only disintegrated and dissipated, but is fully and effectually driven from the system. The evidence that this is so is found in the important fact that not one single instance of a return of any cancerous trouble has been reported or discovered, even after many years of waiting. Scores of patients now in this city, many of whom have been operated upon by our best surgeons, and who have been pronounced

again allotted and all of whom have been pronounced undoubtedly suffering (from the melody, have been treated, pronounced cured, and have never in any single case been subjected to a return. This may be regarded as evidence, beyond all question, of the reality of the cure! Evidence of this character has never yet failed to satisfy every person who has taken the trouble to look into it. Many physicians of standing are among those who have taken the trouble to investigate, and all have expressed themselves as perfectly satisfied that the facts are precisely as have been stated, but only two or three physicians have had the courage to publicly stand up to their convictions because of the fearful persecution which they have met and are sure to meet with from the ruling majority of the San Francisco faculty. Why this is so we leave for those medical gentlemen most interested in ignoring and suppressing an important truth to say. There are at this time 18 patients now under treatment for cancer, all of whom are doing well and will soon be discharged as cured.

This Assured Remedy is Entitled to Respectful Consideration and Investigation

By the medical faculty, because it is a reasonable and apparent truth of importance to medical science and to humanity everywhere. The practitioner has repeatedly offered to treat any patients in a reasonable stage of affliction, who may be submitted by any recognized body of local physicians. It is well known that the treatment is exceedingly mild and absolutely without danger. After years of waiting for our own health conservators to come forward and comply with so reasonable a request, the appeal has now been made to a city 3000 miles away.

Compared With Koch's Remedy.

That this remedy will be found preferable to that of Koch, which it is claimed has already been shown to be of some value in mild cases of cancer (lupus) as well as for consumption, is fully shown from the fact of its effective action in quite extreme cases, and with all classes of cancer—lupus, scirrhus, and especially with that peculiarly dangerous character of this malady which attacks female internal organs. In the latter case it is, if anything, more effective than in any other form of the malady. Such cases, when treated by this remedy, if taken in anything like the early stage, or about the time when a surgeon would suggest the use of the knife as the "only remedy," yield most readily and kindly, without any danger whatever of hemorrhage. Indeed, all natural hemorrhage in such cases is at once stopped, while the cancerous growth comes away gradually and without any suffering by the patient. In nearly all treatment, except in extreme cases, the patient is not confined even to the house—not even for a day. We know of what we are writing, from personal observation, in a great number of cases. The writer has never paid any attention to any case which has not been authoritatively pronounced cancer by some one or more of the most prominent physicians of the city.

The mode of treatment differs in toto from Koch's remedy and is all the more worthy of attention because it is analogous to the action of the usual remedies employed and in direct line with the practice which physicians all over the world have employed for thousands of years in the general treatment of diseases.

It should be stated that the preliminary act in treating either tumor or cancer by this method is by accelerating the passage of certain unguents through the skin by hand-rubbing and by electrical action. Electricity alone appears to be of but little account; but as an aid to the endosmosis action induced by simple rubbing, it is found of much service, and except in extreme cases, induces a more or less rapid dissolution of tumor or cancer, while the constitutional action of the remedies taken into the stomach causes an especially rapid excretion from the body of the diseased or broken-down tissue.

It is often the case that the physician is unable to say whether an apparent tumor is benign or malignant. With this remedy it makes no difference whether it is one or the other. The external applications and alternative remedies may be safely and effectively applied in either case.

Just How Remedies Cure

Will perhaps remain forever in the regions of

TOPOGRAPHIC FEATURES OF SOUTHERN COLORADO.

the unknowable. Mankind may differ or even quarrel as bitterly as they are able as to opinions, but experience is the grand "boss" at last, and subjugated by facts, opposition must retreat in assent and silence. No crime against progress is so great as prejudiced, angry and persistent war against calm and analytical investigation. The latter is that which has been sought by the writer and his friends during the four-year war which he has been compelled to wage against the prejudiced and persistent opposition of the medical faculty of this city, against the efforts at progress which a few humble but earnest citizens have been endeavoring to make.

Before closing this article, we wish to make a statement in refutation of charges which we understand have been urged to break the force of the articles which have heretofore appeared in these columns in reference to the matter of this cure. It has been charged that they were mere advertisements and paid for as such. We desire to say once for all that neither the writer nor any one connected with either of our publications has ever received, either directly or indirectly, one dollar or in any way the value of a dollar in payment for anything which has been written or printed, during the last four years or any other time, in regard to the matter under discussion. Whatever we have done or written has been purely in the interest of humanity and for the furtherance of medical science.

Mineral and Barren Belts.

In a paper by Theo. B. Comstock on the Geology and Vein Structure of Southwestern Colorado is an engraving, herewith reproduced, showing the orographic features of Southern Colorado and the boundaries of mineral zones and barren belts (approximately). The district considered is that portion of Colorado known as the "San Juan Country." In a previous number of the PRESS we gave a plate showing the orographic features of that State in a generalized manner.

In the Central San Juan area one of the most striking features in the distribution of the metalliferous tracts is their isolation from each other, and yet there is nothing in the geography or geognosy of our whole region which, from a cursory view, would explain this result. In only one instance is there a sudden change in topography at the edge of a mineral belt, but there are many similar topographic and geological breaks, which seem to have had little or no effect upon the vein courses. It is not meant that the topography is not closely related to vein distribution in minor features, for this is very evident; only the great geographical landmarks, like many of the higher peaks, do not form the barriers between fruitful and barren areas.

The exception noted is the present Continental Divide. Oddly enough, this almost completely separates the mining country from the Eastern unproductive territory. Approximately following the general trends of this watershed is the line of junction between the Central Highland and three sides of the "Bitter Country" (see plate). Up to this ridge line from the west the veins run abruptly, but, practically, they do not cross it. The hydrographic basin of the Rio Grande is of the most peculiar type in every way.

The engraving gives a clear idea of the geological structure of the region and of the adjacent country upon the east and west, with a plan of the radiating mineral zones of the Central San Juan area.

HENRY C. LEE died at his home in Oakland on Monday last, and was buried on Wednesday afternoon. He had been confined to his home since the latter part of November, and for some months previous had not been in good health. Mr. Lee has been employed with the MINING AND SCIENTIFIC PRESS Patent Agency for the past nine years, his special work being that of preliminary examinations, in which branch he was quite expert. Mr. Lee endeared himself to his associates by his genial manner and uniform good nature, always maintained even in the face of ill-health and adverse circumstances.

SUIT has been commenced at Grass Valley by S. P. Dorsey to compel Andre Chavanne to convey to plaintiff an undivided half interest in the Independence mining claim, adjoining the Maryland on the east.

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 31, 1890.

General trade is stagnant. Manufacturers, merchants and business men in general are engaged more in their annual settlements than in anything else. This will occupy their attention well up to the middle of January. From a thorough canvass of the different industrial interests in this city we can safely affirm that the outlook for 1891 is of the most flattering character. As a rule, interior merchants have smaller accounts than for years. There are few if any idle laborers, as the weather has admitted of outdoor work in all parts of the State. A larger fall or winter acreage has been seeded to grain than ever before, and it only requires light but well-distributed spring rains to produce heavy crops. The prospects for fruits, and as for that, all farm products are of the best. Among manufacturers the outlook is said to be promising. Coal promises to be cheap, while more work is expected. The mining industry, it is claimed by many, will show renewed life. Nearly all the old camps are renewing their youthful vigor and life. The money market is easier. Long-time loans are more readily negotiated and at a shading in interest. The disbursements from now on will be very heavy.

MEXICAN DOLLARS—The market has been quiet at 82@83 cts.

SILVER—Mint purchases under the new law began August 13. The range of prices and quantity thus purchased to date have been as follows:

	Range.	Ounces.
August.....	\$1 13.30 to \$1 20.25	3,309,000
September.....	1 19.50 to 1 13.00	3,137,600
October.....	1 18.95 to 1 04.90	3,330,000
November.....	1 07.70 to 07.10	4,062,000
December.....	1 02.50 to 1 09.00	3,890,000

Total public purchases.....18,268,000
Private purchases.....2,658,974

Total.....20,927,474
Amount required by law.....20,759,100

The market has been more or less inactive, causing quotations to be nominal. The Mint will resume purchases on Friday of this week. It is claimed that prices will rule higher. Interest now centers in Congressional legislation. Bimetallists are making a vigorous effort to pass a free-coinage bill, but at this writing no one dares predict that success will crown their efforts, for there is nothing so uncertain as the action of Congress on any important measure. If this Congress fails to pass a free-coinage bill, there can be no doubt but the next one will come to the rescue of the country and pass one.

QUICKSILVER—Receipts the past week aggregate 174 flasks. The demand is quiet. The market favors buyers.

LIME—Receipts the past week aggregate 3090 bbls. The call is slower, yet for the season it is exceptionally good.

ANTIMONY—Some shading is reported being made to large buyers.

LEAD—The market shows a fair degree of steadiness, as if bottom prices have been touched.

BORAX—Receipts the past week aggregate 220 cts. and exports by rail 320 cts. to Chicago. The market is steady, with a shade firmer tone. The East, it is claimed, will soon increase its purchases.

IRON—Imports the past week aggregate 100 tons from Oregon. The market is quiet, with prices barely steady. Eastern advices report many Southern furnaces out of blast, but owing to the stringency of the money market, other companies were unable to take advantage of the situation. Cash purchases can be placed low, but time purchases cannot be placed except at probably higher figures. English advices are favorable to better prices after the turn of the year. Many furnaces have gone out of blast.

COPPER—The market is unsettled. New York mail advices report as follows: Lake Superior mining companies have decided upon 15¢ per lb. as their price to the home trade for early 1891 deliveries. Quotations equivalent to 14¢ here have been made in the foreign markets to attract export business, and rumor has it that 14¢ would very probably be accepted. A line of about 1,000,000 lbs. Tamarack is said to have been sold for export at about 14¢. For other varieties of copper, prices are, as yet, rather uncertain, there being little business. About 13¢@14¢ for Arizona and 13¢ for common casting brands would appear to be near the mark.

COAL—Imports the past week aggregate as follows: Comox, 4300 tons; Nanaimo, 3432; Seattle, 2300; Departure Bay, 3423; Tacoma, 4000; Coos Bay, 1350; Liverpool, 2571; overland, 60; Kobe, 4400. Total, 25,782 tons. The market, although not quoted lower, is shaping itself for lower prices soon. Coast collieries are shipping more freely, while English coal will soon come to hand in more liberal quantities. In a fortnight, Australian coal will begin to arrive. In the meantime the weather, although cold, is not severe, and does not necessitate as large fires as usually obtain at this season. To offset this, more steam coal is being used, owing to clear weather admitting of more outdoor work.

Wednesday.....	1 02 1/2	1 02 1/2	14 75	4 15	19 70

Trade is stagnant. It now looks as if there will be no material change in the situation until well into January. The money market promises to be very easy after the turn of the year.

Mining Share Market.

Comstock mining shares the past week were strong and higher on Friday, but began to set back on Saturday. On Monday afternoon and yesterday (Tuesday) morning the lowest prices were touched. The manipulation appears to be in Potosi and Bullion so as to get in other stocks preparatory to an up move. The lowest prices since 1836 were touched the past week by the following stocks: Con. Virginia, Ophir, Union, Mexican, Sierra Nevada, Crown Point, Challenge Yellow Jacket, Hale & Norcross, and Alta, and yet there are many who are expecting these stocks to sell for less money. There can be no doubt that everything is being done to depress the market, and at the same time not lose stock. This always obtains before a decided up move in prices. Judging the future by the past, the market should do very much better soon, although many do not look for much before the spring months. This opinion is doubtless formed from the fact that up moves for several years past have been in the spring and in the fall. It may be that the deal this year will be over before spring.

Is it not about time that a grand jury investigates the charges so persistently made against Comstock mine managers, for not complying with the laws of the State of California? Such an investigation would prove of the greatest possible benefit to the mining industry in this coast.

The milling charges, including transportation, on the Comstock are \$7 a ton, with a rebate of \$2 a ton, which makes the charges virtually \$5 a ton.

So far there has not been any freezing weather on the Comstock to give an excuse for shutting down mills. News from the Comstock mines reports they are skirting the ledge on the Potosi south drift running toward Bullion, and, as usual, the character of the ore changes daily. Some ore has been cut going over \$100 a ton, while at other places it goes down to almost nothing. They have run lengthwise of the ledge for a distance of over 30 feet. While many are watching with interest the work going on in Potosi, the better informed miners think the

"true business" is in some other mine. Time alone can prove if this is correct. In Savage, they are still sinking in ore going from \$30 up to over \$50 a ton. It looks as if they are uncovering a valuable body of ore, which, unless spirited away, will give good returns to stockholders. In Hale and Norcross, they are preparing to prospect more actively to the west the 1300 and 1400 foot levels. Miners think favorably of the outlook. The superintendent of Con. Virginia still ignores the 1400-foot level. By those who should know, it is claimed that there is rich ore on this level. Why not run for it? No further news is given from the northwest drift in Best and Belcher, which was being run to tap the continuation of the rich ore found in Con. Virginia.

In Alpha and Exchequer, active and important work is being done, as there is also in Con. Imperial, Challenge and Confidence. In the latter two, with the opening up of the 300-foot level, a body of rich ore will be uncovered, that, if mined honestly, will admit of dividends being paid. Important secret work is being done in Yellow Jacket and Crown Point.

From outside mining districts the news is becoming more interesting. In the Bodie district, the Standard mine reports a strike of high-grade ore running over \$100 a ton. In Bodie, all advices are of the most encouraging character. Important work is being done in Bulwer and Mono. In the Quijota district, it now looks as if more will be done soon to put the mines on a paying basis. From the Tuscarora districts our advices are confirmatory of more rich ore being discovered in some of the mines. The work being done in Belle Isle on the 450-foot level is closely watched.

Probably one of the most important events that has lately taken place in the mining share market, was the serving to-day of a notice by M. W. Fox, through his attorney, W. T. Baggett, on Mr. Levy, president of the Savage Mining Co., requesting, as owner of 19 1/2 feet of the old Bowers and Rogers title to the Savage ground, that an accounting or adjustment be made of all billion taken out of the mine. The Bowers and Rogers title was confirmed by the courts in a suit brought by the Savage Mining Co. against the Bowers and Rogers claimants. After the decision in favor of the claimants against the company, the Savage Mining Company bought all the claimants' interests excepting the above 19 1/2 feet. It is only reasonable to suppose that Mr. Fox will also take steps to prevent the company confiscating to the mill much of the rich tailings, and will also insist upon the mine's being managed differently. These changes will result in great benefit to the mining industry.

443,204.—DEVICE FOR INDUCING FULL RESPIRATION—C. C. Davis, Los Angeles, Cal.
443,394.—LAWN-SPRINKLER—R. Franken, Pomona,

Silver-Plated Amalgam Plates.

The greatly increasing demand for these plates by gold miners has demonstrated their superiority over all other methods for saving gold in quartz or placer mining, particularly fine or float gold. These plates are in great demand in all the Pacific Coast mining region, from Alaska to South America, the Rocky Mountain mining States and Australasia.

The San Francisco Plating Works, 653 and 655 Mission St., San Francisco, of which Mr. E. G. Denniston is proprietor, are constantly filling orders for them, sending out a great many thousands of square feet every year to gold miners all over the world. The plates for all the large 120 stamp mills in Alaska were made at the San Francisco Plating Works.

Mr. Denniston is the pioneer in this line of business, having established his works 23 years ago. Mr. Denniston says he has received every first premium awarded for silver-plated plates at the fairs held on the Pacific Coast, having received 15 silver medals in all.

The reputation of his plates is world-wide, he having been successful in competition with all others. Only the best Lake Superior copper and refined silver are used in their manufacture. They are made of any size, plain or corrugated.

The great success of Mr. Denniston's plates is due to his thorough knowledge of the business and possession of the best facilities; also, to adhering strictly to agreement in depositing full weight of silver on every order.

The work done at the San Francisco Plating Works consists of gold, silver, platinum, nickel, brass, copper and bronzes plating on every description of metal work. The work is first-class, and done at lowest possible prices.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

TRAFTON'S
Gold Saving Device.

Patented June 17, 1890.

A NEW DEVICE TO BE USED ON TABLES FOR Gravel Mills and Undercurrents to Hydraulic Claims. When used in quartz mills it is equal to silvered plates. It is simple and economical in its construction and practical in its operation. Send for circulars.

CHAS. TRAFTON,
Yankee Jim's, Cal.

THE BRITISH
SOUTH AFRICA COMPANY.

MEMORANDUM

Of the Terms and Conditions upon which
Persons are Permitted to Prospect for
Minerals and Metals in Mashonaland.

Prospecting Licenses.

1. Any person may take out a license on binding himself in writing to obey the Laws of the Company and to assist in the defence and maintenance of Law and Order if called upon to do so by the Company—such license to bear a stamp of the value of one shilling.

Right of Prospecting Holders to Peg Off Claims.

2. Every license-holder is free to peg off one alluvial claim and ten quartz reef claims in block. When the claims have been marked off the same shall be registered and the license-holder shall receive a certificate of registration—such certificate to bear a stamp of the value of half a crown.

Size of Claims.

3. Alluvial claims are in extent 150 feet by 150 feet. Quartz reef claims are in extent 150 feet in the direction of the reef and 100 feet broad. The claimholder may follow the reef in all its dips, spurs, angles and variations.

Terms on which Quartz Reef Claims may be Held.

4. Every registered quartz reef claim is to be held by the prospector on joint account in equal shares with the Company, and every transfer, hypothecation or lien of his interest in such claims is subject to the rights of the Company.

Registration of Alluvial Claims.

5. Certificates of registration of an alluvial claim or portion of claim in any alluvial digging are to be covered by a stamp of £1 for each month for which such claim or portion of claim is registered, payable in advance; the Company, however, claim no rights in respect to gold won from alluvial claims.

Discoveries of Alluvial Diggings.

6. The Discoverer of an alluvial digging, distant not less than ten miles from any known alluvial digging, shall have the right to peg out two alluvial claims in addition to his other rights.

Work to be Done on Claims

7. Every digger shall, within four months from the registration of the block of claims, under penalty of forfeiture of his claim license, sink upon his block of quartz reef claims either a shaft of a depth of 30 feet in the reef or a shaft of at least 30 feet outside the reef with a cross-cut through the reef.

Certificate of Inspection.

8. So soon as the claimholder has done the required amount of work and has given evidence that he has opened up a payable reef, he shall receive an Inspection Certificate to the effect that the required work has been done—such Certificate to bear a stamp of the value of 15 shillings.

Payment of Claim License.

9. Prior to flotation the claimholder shall pay no license. After flotation the license shall be at the rate of 10s (ten shillings) per claim per month.

Flotation

10. On claims being ascertained to be payable, the Company have the right to float them into either a joint stock company or into a syndicate. The Company shall therefore within a reasonable time either make a proposal or decline to do so. If the proposal is accepted by the claimholder he shall on flotation be entitled to half the vendor's scrip in the shares of the Company so floated. If the claimholder is not satisfied with the Company's proposals, he has the right within one year to prove to the Company that he is in a position to float on better terms, and he shall, on the flotation of the claims, give the Company half the vendor's scrip.

Pegging Out of Additional Claims.

12. Any claimholder shall be at liberty to peg out a fresh block of ten (10) claims.

(i.) When he shall have given notice of abandonment of his existing block of ten claims.

(ii.) When he has received his Inspection Certificate from the Mining Commissioner.

But no claimholder who has acquired his claim or claims as a prospector shall be the registered claimholder of more than two blocks of claims of ten claims each.

Agreement.

13. An agreement, binding prospectors to abide by the Laws of the Company under penalty of forfeiture of rights, is to be signed by all the prospectors either at Kimberley or Tuli.

By order.

F. RUTHERFORD HARRIS,
Secretary.

ITINERARY OF ROUTE.

MAFEKING—100 miles north of terminus of railway, which is now at Vryburg. The latter town is about 150 miles north of Kimberley. Kimberley is 647 miles from Capetown.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.

A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.

A. P. GRANGER, Denver, Colo.

Assessment Notices.

GRAY EAGLE MINING COMPANY.

Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1890, an assessment, No. 21, of Three (3) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1891, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 16th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARRON, Secretary pro tem.
Office, Room 11, No. 303 California Street, San Francisco, California.

INYO MARBLE COMPANY.—LOCATION

of principal place of business, San Francisco, California. Location of works, Keeler, Inyo County, California. Notice is hereby given, that at a meeting of the Board of Directors held on the 10th day of December, 1890, an assessment (No. 11), of Ten Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 132 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. LUCE, Secretary.
Office, 132 California Street, San Francisco, California.

The German Savings and Loan Society.

526 California Street.

DIVIDEND NOTICE.

For the half-year ending December 31, 1890, a dividend has been declared at the rate of five and forty-hundredths (5 4/100) per cent per annum on Term Deposits, and four and one-half (4 1/2) per cent per annum on Ordinary Deposits. Payable on and after FRIDAY, January 2, 1891.

OEO. TOURNAY, Secretary.

SAN FRANCISCO SAVINGS UNION

532 California Street, Corner Webb;
Branch, 1700 Market Street, Corner Polk.

For the half year ending with 31st December, 1890, a dividend has been declared at the rate of five and four-tenths (5 4/10) per cent per annum on Term Deposits and four and one-half (4 1/2) per cent per annum on Ordinary Deposits, free of taxes, payable on and after Friday, 2d January, 1891.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to improve the geological theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE \$2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

Testing and Working Silver Ores

A VALUABLE BOOK

An Illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and perchloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Pathe's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heating of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroeck's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Knecker's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quick-silver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

—THE—
PERFECTED
DOUBLE
Economic
Quartz
Mill.

Attached to each Mill
 is an effective
Automatic Ore
Feeder.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] **JAS. S. REYNOLDS,**
 Supt. New York Mine, Railroad Flat.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$825, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 3, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased. ADAMS & CARTER.

FOR SALE CHEAP

— BY —

RISDON IRON & LOCOMOTIVE WORKS,

— THE FOLLOWING CHOICE LOT OF —

PUMPING, HOISTING AND QUARTZ MILL MACHINERY,

— COMPRISING THE ENTIRE PLANT OF —

THE JOSEPHINE MINE,

— AND INCLUDING —

- 2 HAMILTON CORLISS ENGINES, 10"x30", first-class condition.
- 2 TUBULAR BOILERS, 52"x16 feet, complete.
- 1 TUBULAR BOILER, 40"x14 feet, complete.
- 1 LOCOMOTIVE BOILER, 5-ft. furnace, shell 28" dia., 9 feet long.

- 1 9x10 DOUBLE CYLINDER VERTICAL HOIST with Indicator, Cable, Cage and Cars.

FULL SET PUMPING GEARS, Bob and Connections, Pumps, Column Pipe, &c. Lot of Steel Rails.

- 1 20-STAMP GOLD MILL.
- 8 FRUE CONCENTRATORS.
- 4 CHALLENGE FEEDERS.
- 1 BLAKE ROCK BREAKER.
- ORE BIN GATES, RETORTS, MELTING FURNACES, ASSAYING OUTFIT.
- 5 STEAM PUMPS, 4000 FEET WATER PIPE.

ALL BUILDINGS, including Residence, Office, large lot Mining Tools, Complete Blacksmith Outfit.

Will sell all or a part cheap. Everything nearly as good as new.

ALSO 12 FRUE CONCENTRATORS AT OUR WORKS. LOW PRICE. FIRST-CLASS ORDER.

— ADDRESS —

RISDON IRON & LOCOMOTIVE WORKS, SAN FRANCISCO, CAL.

"Sensible" Horse Power Hoisting Whims.

These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

- No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.
- No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

San Bernardino County Silver Mills.

The Runover mill, a representation of which is given in the accompanying cut, is situated on the edge of the desert south of Calico mountain, in Calico district, San Bernardino county, this State. It is the property of J. S. Doe of San Francisco, who is known as the "mining king" of Calico district, he being the possessor of 32 mining claims, most of them being covered by U. S. Patent, and many of them valuable properties.

The mill in which the ore from all Mr. Doe's mines is crushed is a 20-stamp one, equipped with all modern appliances. The Boss amalgamating process is used. The cost of reduction of the ore is only \$3.50 per ton, although coal from Gallup, costing \$9 per ton, is used for generating steam.

When the Silver Valley Land & Water Co. has completed its ditch, water for power can be procured at nominal expense, which will materially reduce the expense of ore-crushing at this point. The mill has been principally supplied with ore from the Red Cloud, Mammoth, Silver Monument, Garfield and Occidental mines. Its capacity is 60 tons per day.

The Waterloo Mills, shown in the engraving, are the property of the Oro Grande M. Co. of Milwaukee, and are situated one mile and a half north of Daggett, San Bernardino county. C. M. Sanger is the manager of the company and Emil Sanger the superintendent. The 60-stamp mill is new and has all modern appliances for handling silver ore cheaply. The 15-stamp mill was the first one erected by the company for reducing the rich ores of these numerous mines. Their principal mine is the Silver King, and an important lawsuit is now pending in Los Angeles for a portion of this claim, J. S. Doe, the owner of the Runover mill, being the other contestant in the suit, which was referred to in the PRESS last week.

The Oro Grande Co. is working in these two mills the ores from the Waterloo mine, which are transported to the mill on a narrow-gauge road six miles in length.

By using the Boss continuous process they mill these ores for \$4 per ton. Gallup coal costs \$8.75 per ton by contract. The stamps of the large mill weigh 850 pounds each, and crush 3 tons to the stamp in 24 hours. There are 9 grinding pans, 2 amalgamating pans, 1 cleanpan and 12 settlers. The building is lighted by electricity, and steam is used as the motive-power.

Report of the Debris Commission.

This document has, as we are informed, been so far advanced toward completion that it

nor do we apprehend there will be strong dissent to it in any other quarter. So capable are the members of this Commission known to be, and so disinterested have they shown them-

The New Geological Map.

The preliminary geological, mineralogical and topographical map of the State of California, prepared by Wm. Irelan, Jr., State Mineralogist, has just been issued by the Mining Bureau. It is artistically a fine work and of royal proportions, having been projected on a scale of 12 miles to the inch. While this map, as its name implies, is but the basis of something more extended to be worked out hereafter, it is nevertheless wonderfully full, considering the short time allowed for gathering and collating the data of which it is composed.

We find here, as a ground work, the topography of the entire State, delineated in a general way; the principal mountains with their culminating peaks, together with many of the subordinate ranges, isolated buttes and volcanic cones; the rivers and larger creeks, the bays and inlets; lakes, lagoons, sinks, salines and other deep-lying desert depressions are all accurately laid down here. The entire coast-line of the State is faithfully depicted, the only islands being also shown. The towns, cities and mining camps; the tule, salt and marsh lands; the railroads, built and projected; the base lines and lines of latitude and longitude with such portions of the public domain as remain unexplored, also such as have been surveyed, sectioned and subdivided, are each in its proper place exhibited. In short, every notable object, locality and physical characteristic of California seems to have found a place on this great land chart.

The several rock formations that go to make up the crust of the earth, also the auriferous gravels and quartz lodes are designated by different colors, whereby their sites and comparative extent can be readily seen and distinguished. In the margin is placed a table showing the altitudes of mountain peaks and passes as well as of many

other points of special interest. In another table all the more valuable metals and minerals are represented by figures, which, besides indicating the localities of their occurrence, denote their relative importance, gold being numbered 1, silver 2, etc. A list is given of all the Mexican and Spanish grants issued in California.

There are other features of this map calculated to greatly enhance its utility, but to which we cannot at this time give more extended notice. When the manner of disposing of this map shall have been fully determined upon, we will advise the public of the fact.

THE RUNOVER MILL, CALICO MINING DISTRICT.

THE WATERLOO MILLS OF THE ORO GRANDE MINING CO.

awaits now only some revision at the hands of the Commission when it will be forwarded to the War Department at Washington, an event that it is expected will occur about the end of the present month. As to the purport of this report, we are of course not advised, nor will this be generally known until the report itself shall be due course of events be given to the public.

Whatever the finding of the Commission, should any definite conclusions be reached by it, we think we can answer for it that the same will prove satisfactory to the hydraulic miners,

that all the parties concerned in this issue repose in them the utmost confidence. Whether or not there may follow entire compliance with their recommendations, should they have any to make, certain it is no one will presume to question their ability or impeach their integrity. That their report, whatever it may be, will prove helpful in the solution of this vexed question we verily believe. We await its appearance.

The Copper Queen Co., Arizona, have just put up over \$70,000 for the Neptune group.

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XXV.

[Written for the Press by JAMES H. CROSEMAN.]

Exchequer Mining District.

From Fenner station to Goff, on the line of the A. & P. R. R. (distant 12 miles), we enter the southwesterly border of the above-named district, which is north of the railroad and in the northerly extension of the Pah-Ute range of mountains. It embraces an area of 402 square miles. The formation is lime, porphyry trap and secondary granite. This district, though extensive and rich in mineral wealth, has been but little prospected, owing to a scarcity of water—there being but three springs of note in this extensive area. Two of these are near the Cashier camp, and the other, known as the Piute Spring, is situated in the extreme northeasterly portion of the district.

The principal mines of the district occur in the vicinity of Cashier camp, seven miles by road northeasterly from Goff station.

The Exchequer mine has been developed by two shafts, one of 40 and the other of 30 feet. The gangue of the vein is quartz varying from one to six feet in width. The ores are chlorides of silver; values from 50 to 150 ounces per ton. The vein in depth is a well-defined quartz, white, but barren of ore.

The Dreadnaught has an 8 foot ledge and a 50-foot shaft. The grade of the ore exposed varies from one to 600 ounces of silver per ton. This mine, like the Exchequer, is barren in depth so far as tested. The remaining three locations are undeveloped.

The northerly series of the parallel veins consist of the Center No. 1, the most easterly; thence westerly on the same vein, the Bermuda, Anchor and Center West extension, none of which have any developments of note.

Of the southerly vein of the series, the Cashier is the best developed. There are three shafts of 10, 75 and 150 feet respectively. Lateral drifts are being driven on the vein between the shafts on the 70-foot level for working and ventilation purposes, and preparations are being made for sinking No. 1 or East shaft to the 200-foot level. From these workings, two carloads of ore have been extracted and shipped to San Francisco, which yielded \$100 per ton. One-quarter of the value was gold and the remainder silver. The ores of these mines to all appearances go to the deep and the prospects are encouraging for a good mine.

The remaining locations are known as the Cashier Extension East, Occidental, Perseverance and Phoenix. The Cashier proper is the central claim, and W. K. Alderley, Consulting Engineer of the Waterloo mines of Calico, is the leading spirit of the enterprise.

The Ventrigger Mines

Are situated nine miles north of Goff Station and comprise a blanket or surface deposit of the ore of copper, carrying both gold and silver. The droppings show a width of 60 by 200 feet in length. Developments consist of numerous pits and three small shafts. The ore obtained runs from 5 to 40 per cent in copper carbonates and oxides—the latter predominating. The silver values vary from 2 to 10 ounces; the gold averages \$6 per ton. A shipment of selected ores has been made to San Francisco, yielding a small profit over expense. Water is hauled from Homer station, a distance of 10 miles, to empty the camp.

The Sacramento Mining District

Cornere on the north west at Homer station on the A. & P. R. R. Its dimensions are 144 square miles. The easterly boundary line is 12 miles from the Colorado river at a point opposite the Needles. This district promises to be an important gold-producer. The veins are of mammoth proportions and well-defined gangue quartz, carrying free-milling gold ore. The principal mine is known as the Ithex.

We retrace our steps and return via Homer, Goff and Fenner to Danby and prepare for a visit to the celebrated old woman of Old Woman's mountain in which is situated the

Scanlon Mining District.

To avoid repetition, the reader is referred to the MINING AND SCIENTIFIC PRESS of Aug. 9th, which contains Article No. 5 of this series, in which is a description of the Old Woman's mountain and its mineral features. On the summit of the range there are two figures standing in bold relief against the horizon that bear a strong resemblance to the female form dressed in modern costume.

The axis of the range is granite, through which courses diagonally a belt in which a powerful vein of quartz and baryta occurs, carrying the ores of lead and silver in the form of carbonates, galena, brittle silver, and chlorides of silver. Values vary from 20 to 60 per cent of lead and from 10 to 65 ounces of silver per ton. The vein is strong, well defined and traceable for a distance of more than 6000 feet. The Buckeye has been considerably developed by shaft and drift; the Keystone is adjoining; and others are the Hawkeye, Silver Wave, and Thompson. These claims are situated on what is known as Carbonate Hill. Their courses are northerly and easterly and their strength from 30 to 50 feet. From this vein in an easterly direction on Mineral Hill in the granite proper, an extensive group of small silver-bearing

value occurs, carrying high-grade ores. Their locations are as follows: Big Chief, Old Lady, Silver Cliff, Morning Star, Golden Eagle, Silver Top, Stella, May Queen, Silver Leaf, Hunter, Little Giant, West End, and Mayflower. The Hunter has a 200 foot tunnel showing high-grade ore. The Little Giant has a 10 foot out, the Mayflower a 50-foot shaft. The developments, though insignificant, give promise of great future values. Robert Hunter is the moving spirit of the mines of the Scanlon district.

Returning to Danby, we take a southeasterly direction, leaving the Old Woman and her mountain on our left hand in a northerly direction, and at a distance of 25 miles at the southerly extremity of the mountain we reach the head of what was at one time a saline lake of considerable extent, judging from its basin-shaped formation and an intensely saline deposit found in its center of about three miles in circumference. This deposit is known as

Crystal Salt.

A very appropriate name, as aside from its beautiful, clear, transparent, crystalline structure, it is very near chemically pure chloride of sodium. Near the center of the head a shaft has been sunk 60 feet. This crystallized product returned, by analysis at the California State Mining Bureau's laboratory, 97 per cent pure salt. Water was encountered at a depth of 33 feet, which, on evaporation by the sun's rays, returns a pure saline powder suitable for table use or for any other purpose for which salt is used. This salt has been mined, hauled to Danby on the A. & P. R. R., and shipped to Arizona and Mexico for curing beef, salting stock, and for ordinary purposes. W. H. Drew of San Bernardino is the owner.

(To be Continued.)

A New Mining District.

A new mining district has just been formed, to be known as the Soda Creek mining district. It is situated on the headwaters of Little Kern, about 40 miles northeast of Porterville, and includes the Tule ranch 14 miles from Springville. John M. Nelson has been elected recorder. The boundaries commence at the southwest corner of Section 33, Township 20 South, Range 31 East, and runs a northeast course to the summit; thence northerly on the summit on the dividing range of the waters of Kern and Tule, passing the waters of Mountaineer, Alpine, Soda creek and Little Kern, taking the divide between Big and Little Kern to the mouth of Little Kern; thence west on the Standard line to the place of beginning.

The district is well watered and well timbered. There is about a full township of the mineral deposit, mostly iron and limestone bases. The ore as yet developed is low grade, but evenly distributed and free from rebellious ores. The surface ore is of low milling grade, going from \$2 50 to \$4 per ton.

Eight or ten parties have made locations, among whom are Dr. Todd Martin and others of Tulare, Crowley Brothers of Visalia, Garner and others of Red Bluff, and the Gilliams of Porterville, Dr. Hathaway of San Luis Obispo, and several others of Tule river and elsewhere.

There is two feet of snow on the ground, the altitude being about 9000 feet, the trail not being very safe for travel without a guide. Mr. Nelson and others are trying by engravings to raise a fund to make a good trail, in anticipation of the amount of business likely to be passing between Porterville and the mines of the district the coming spring. The immense quantity of paying milling ores lying about the surface is a pretty satisfactory indication that there is an immense body of rich ore lying under and near the surface which will, with plenty of timber and water at hand, promise to make a district of great importance in the mining world.—*Monarch Tidings*.

Hunting for Coal.

The high price of coal in the San Francisco market at the present time has evidently agitated the work of discovering coal deposits in California. At all events, prospectors have gone to work in a dozen localities recently. Two companies have been organized to prospect for coal in San Mateo county, where small deposits have been known for several years.

It has been learned that at Carmelito, in Monterey county, a coal chute with a capacity of 250 tons will be erected. The chief engineer of the California and Nevada road, with a corps of assistants, is at present engaged in making an survey for a railway to the coal mines. Coal of excellent quality is said to exist in the mine. The latest reports from Covelo, near Ukiah, state that there is no longer any doubt of the evidences or extent of the coal deposits in the neighborhood of Round valley, in Mendocino county. The deposit, it is said, is larger than any yet found on the Pacific Coast. The coal vein in Mendocino county is known to extend north for nearly 60 miles into Trinity and Humboldt counties. In many places the vein has been found to be 20 to 30 feet thick. More than two-thirds of this new coal-field belongs to the United States Government, being located on the Round Valley Indian Reservation, which is now being appraised by a commission appointed by President Harrison.—*Chronicle*.

Mapping the Death Valley Region.

As a result of the expedition to explore Death valley and the contiguous country, many new species of mammals are being received by Prof. Merriam of the Agricultural Department, and the work has only just commenced. This exploration has nothing to do with the Geological Survey, so that all the stories about searching for lost mines and fabulous treasures of precious minerals are absolutely without foundation, as the object sought for is simply to trace out the life zones and embody the result of the observations in an elaborate report with maps that will be of great benefit to this and future generations. Twenty thousand square miles of territory will be surveyed this season, taking in parts of Kern, Inyo, Tulare and San Bernardino counties in California, and a small corner of Nye county, Nev.

Death valley forms a small part of the territory laid out for the season's operations, and it will be completely covered during the winter months, so that the distressing heat of summer may be avoided. When the temperature becomes intolerable on the sandy wastes of the desert, Prof. Merriam's men will rise to the higher altitudes of the parallel mountain ranges on each side of the valley, all a terra incognita so far as things agricultural are concerned, including Mt. Whitney, the highest peak in the United States.

When they have gone over the ground thoroughly and made the necessary experiments, they will issue maps, showing the different life zones in colors, with another series of maps showing the special species and groups of species, also in colors, so that when it is proved that a country is habitable and the ground susceptible to profitable cultivation, farmers will be able to turn to these maps and trace out just where they can raise certain things without being put to the expense of costly agricultural experiments. The causes which led to the distribution of animal life serve to indicate the distribution of crops, and Prof. Merriam will be able to tell with great accuracy what will thrive at certain altitudes, on certain slopes, under certain conditions. His purpose is to map all of the Western United States in this manner.

With reference to this particular section, the professor says that owners of comparatively small farms can locate their lands so as to take in two or three distinct life zones, giving them opportunities to harvest various crops at almost all seasons of the year. Prof. Merriam will leave for California about March 1st, in time to join his two parties of explorers when they have come together in Death valley, preparatory to going to the mountains. One party has already entered the unknown country from Nevada, and the other should leave a point in San Bernardino county in a day or two, working northward.

This expedition will be by far the best ever fitted out by the Government for a similar purpose. In its personnel it is unequaled, men composing it standing prominent in their various branches of science. Vernon Bailey, the second in command, has been chief field naturalist of the United States for four or five years, with a large and valuable experience in the West, both the summer and winter. He is accounted the best collector of mammals in the world, and one of the very best field naturalists anywhere. He was assistant to Prof. Merriam in the biological survey of Arizona two years ago and was with him in Idaho and Nevada last season. Like his chief, he is not content with sitting in an office in Washington, but must be in the field, where the work involves great hardship and much privation, besides arduous labor.

T. S. Palmer of California, and one of the best all-round men in the service, is the man in charge of one party, and Prof. Merriam relies upon him for much of the success of the expedition. He is assisted by E. W. Nelson, who spent five years in Alaska and published a quarto report of his travels, which includes a sledge journey of 3000 miles alone with his dogs and a native guide. During this journey he ruined his health and was forced to live in California.

Dr. A. K. Fisher of New York will be the practical man of the outfit, being an expert at trapping animals, shooting and snaring birds and preparing skins. Besides, there will be a botanist of note, and instruments will be carried to make accurate topographical surveys and measure altitudes. Prof. Hinton, Chief of the Irrigation Department, is trying to arrange his affairs to join the party, and if he succeeds he will be a valuable acquisition. No effort will be made to look for gold or silver, as it is purely an agricultural, not a mineral, project.—*Chronicle*.

TO DIG FOR PETROLEUM.—A lease for 9362 acres of land lying in the Matlatz valley, near Eureka, Cal., comprising portions of the ranges of J. Chambers, O. Freeze, C. A. Johnson, C. A. Miner, J. Walker, D. Zanani and C. Miner, was filed for record recently. The lease is given for 50 years, and the lessees, C. A. Barrow and Irving Foulke of Ventura, agree to develop the petroleum supposed to be abundant in that section. One well is to be sunk within three years, and others to follow. The lessors are to have ten per cent of the net proceeds of the oil. Provision is made in the event of discovery of other minerals.

For Reducing Ore.

The lonely-looking structure on the south bank of the channel below the Crown mills has been a puzzle to many persons who have observed it. That shed is the nucleus of what may be a great manufacturing enterprise in the near future. It is a place where J. R. Moffit is perfecting his invention for reducing refractory and other ores.

The machinery for the purpose, which is nearly perfect, is very curious yet very simple in principle. The first device might be called a triple furnace. It consists of two cylinders, one inside the other, and over the furnace proper. In the inner cylinder the ores are placed after being reduced almost to a powder by a crusher. The inner surface of this has ridges a couple of inches apart and about half an inch wide. The outer cylinder is filled with wood, and when both are filled they are tightly closed so that no vapor can escape. Fire is then raised in the furnace and the heat is raised by a pressure blower, which maintains it in the proper degree to char the wood in the outer cylinder and fuse the ores in the inner chamber. While this process is going on, the inner cylinder with the ore is made to revolve, while air is introduced into it from without. The ore being lifted by the ridges falls from them when near the top, when by the burning of the oxygen of the air the heat is raised to the fusion point and the ores reduced to ashes.

When thus reduced the ashes are forced into a tank of water where they are held in solution and drained off while not a particle of the metal is lost. In a report of the Superintendent of the Mint in San Francisco some years ago it was estimated that gold and silver worth \$85,000 had been carried up the smokestack and wasted in one year by the draft required in the ordinary process of fusing those metals. All of Mr. Moffit's processes being performed under pressure, no vapor escapes. In the process of reduction the metal is necessarily reduced to particles so minute that an idea of their lightness may be gained from gold leaf, which, though a breath may blow it away, is not so light as the infinitesimal particles to which his process reduces the metal.

From the tank where the precious metal is precipitated, it is transferred to an amalgamator where it is gathered by means of quicksilver, the process of which is familiar to those who know aught of mining and its kindred industries.

By the Moffit process a vast amount of ore that will not now pay to work can be made profitable. Hitherto, very low-grade and refractory ores have been unprofitable by reason of the waste which this process saves. It is quite as well adapted to rich ores because the process is as ready as any other, while saving so much of the product.

Mr. Moffit is not a novice or a speculator in these matters. He is an experienced miner and metallurgist, and has been almost the only successful prospector of river mining on the Tuolumne, where he has lived many years. He is the owner of valuable property in Tuolumne county, and is the builder of what is known as Moffit's bridge, on the Yosemite road. He has conducted his mining operations there on a large scale. He constructed a dam 36 feet high and carried the water over his mining property through a flume 900 feet long. He had invested a large amount of capital and had gotten down to pay-dirt, where he was taking out \$1000 a day, when a freshet of unusual suddenness and volume came down and washed away his work.

Last year he returned to the work undiscouraged and put in a permanent dam which no freshet can injure, and next season will resume operations.

His inventions, which are protected by patents issued in 1885 and 1890, will be ready to be put into the mines during the coming year. He is not seeking to sell territorial or manufacturing rights or any share in his inventions. It is his intention to establish a manufactory in Stockton, make the machines and let them out to miners on a royalty. Though very little public mention has been made of the inventions, mining experts seem to have learned of them, and Mr. Moffit has numerous visitors, all of whom are highly pleased with them and have high expectations of them.

The introduction of the Moffit machine into the mines of California means a vast increase in their productiveness and a proportionate increase of the wealth of the State. The establishment of shops for their manufacture in Stockton will add another and very important feature to the manufacturing industries of the city.—*Stockton Independent*.

IRON MOLDERS' UNION.—This organization has elected officers for the ensuing six months, as follows: President, Joseph F. Valentine; vice-president, George H. Lubbart; recording secretary, Richard Barnett; treasurer, Thomas Haly; inductor, Charles McLaughlin; door-keeper, F. Herlitz; Executive Committee—E. R. Harper, Joseph Barnes, James Ferguson, Wm. Potter, Thos. Dixon; Auditing Committee—J. D. O'Neil, J. de Suoca, A. McDermott.

LEDGES containing gold and silver have been found in the mountains between Glen Ellen and Napa Valley. After the experience of finding gold in the coast range at Los Barros, Monterey county, it may be that good claims will be developed at the new finds in Sonoma county.

Wild Flowers.

[By MISS LILIAN HOWARD, of Santa Cruz.]

The great mass of wild flowers form the unconsidered trifles of our fields and plains. They owe no thanks to man, for he does not care to perpetuate them, neither have they fear of him, for they do not, as a class, infringe upon his domain. A few may please him by their brilliancy of coloring, as they grow in masses and blend harmoniously with some pleasing landscape; their patches and bands of blue and white and their long stretches of gold and orange may compel attention and even admiration. A few may please the casual observer by the beauty or peculiarity of their forms, as in the case of the rose, the lily, the dicentra, and the lady slipper.

A few have become general favorites on account of their extreme delicacy of form and color, as the baby blue eyes and the lily bell. But it remains a melancholy fact that the popular expression is a cynical smile and a suppressed murmur of weeds, when the subject is broached.

Well, there are weeds and weeds. A few of our flowers have become so-called outcasts, and lift their dainty cups rather sadly, without receiving an admiring glance, except from some misguided botanist, or maybe a sentimental but unsophisticated young lady, who is informed with a covert smile that she may have a whole county full, and welcome, if she will only pick them out. The blind weed, red sorrel, and the so-called yellow hell-trope may serve to point a moral and arouse a smile at the expense of an enthusiast.

Weeds? And how different they really are from weeds. The real weed is as much of an aristocrat as wheat or corn, and usually gets the same amount of cultivation. He lives by his wits, but gets the best the land affords. Of course we do not mean the kind one that peeps up along the wayside, or in neglected fence corners, or takes unto itself a bit of waste land, to be cast out the first time the soil is turned by the plow. We mean the kind that tries to take the whole farm, wants to grow in the mellowest soil, overshadows the young crop above ground, and sends out millions of little roots to choke it off underground. The flowers are inconspicuous, that it may not waste its substance in show. Its seeds are produced in countless numbers, and of course they are ripened and scattered before the crop is ready to be gathered. These seeds are furnished with quaint devices for preservation and dissemination, as hooks to catch the coats of passing animals; little hooks to anchor themselves to the ground or other weeds; twisted awns with bristles, to cling to the ground; down, that will float them far and wide on the breeze; and lastly a bitter or nauseous taste, or a gummy coat, to discourage the browsing propensity of animals. Whatever plan man or beast contrives against them, they try to meet it in time with a cunning device for defense, so after a long and relentless war, our most troublesome weeds are developed.

Their vitality has furnished subject for epigram and moral in all ages, and the longer they have contended against man, the more exasperating they are. For it is a well-known fact that the strong, aggressive weeds of older settled countries overtop and thin out the weeds of new countries which have not been compelled to fight for their lives. So weeds are as much the result of selection as the giant pansy, rainbow rosea and Japanese chrysanthemums of the horticulturist. Then our flowers being the results of modifying circumstances and conditions through a long course of years, whatever serves as a distinguishing mark in our cultivated as well as our wild species is the sign to tell the story of their lives to him who reads.

But there are always two sides to a story, and if the thistle and the cactus could tell of their wrongs, no doubt the story would reconcile us to their prickly skins. If, as I said, imitation is the sincerest flattery, what intelligence we must grant some of the wild flowers of our hot, dusty plains and hillsides. There grows the Mexican poppy, with spines and needles that would outstick a Canada thistle, and with the same dusty, white-downed leaves as its thistle neighbor. A casual observer would readily mistake it, and it is only when the glory of its delicate white blossoms are unfolded that the cheat is discovered. Who and what was the enemy against which the cunning flower fairly first armed itself? That its defense is secure, the rash investigator can mournfully testify.

There must have been a wonderfully omnivorous beast of the field prowling these plains in those old days, or it must have been a much starved one, for this poppy is not the only plant which has bare thorns armed itself. A species of wild sage has adopted the same livery, and pushes out its curious long blue corollas with its salmon pink anthers, from a bristling droile of prickles that would do honor to any thistle. Blue is the bee-color fortunately, and I am sure no other creature would willingly take the out-post for the sake of the treasured honey.

The mentzelia is a co-resident of these advanced thinkers, and is almost converted to their ways; it is not quite so dusty, not so prickly and much more showy than its neighbors. Protection is their motto, for on those wide stretches of dry country, the race is to the one who will not be eaten, and to the one who will not be killed by thirst; so the object of their little lives is to store up their moisture, to hide themselves and to be unpalatable when found.

But our most beautiful wild flowers are found

in our fields and in the borders of our forests, as the popularity of our creamcups, nemophilas, giliae and lupines shows. Our lilybells, too, are a revelation in themselves, and an open hillside with yellow calochortus, Johnny jump-ups and pink mallows is a feast for all eyes.

But the snowy lilybell is our poem; in color, in form and in manner of growth it appeals to us, and though usually called by an unpoetical name (harebell), it is still the one treasure of our fields most valued. It varies in color from a deep, dull crimson to a clear white, tinged with pink and green, and the pretty bells hang in clusters of from three to ten on their slender stems. Then its cones of all colors, the golden lilybell or Diogenes' Lantern, the many-colored Mariposa lily, the white clustered variety with its long leaves, and the pale-lavender variety, are almost as interesting as itself, and furnish many a suggestive page for the paragraph, the sketcher and the poet.

In fact, the lily family is well represented in our State, and our fields can vie with our gardens in presenting this most graceful flower. The tiger-lily, the white Washington lily and some smaller varieties remind us in a dignified way that Dame Nature is still in the race with man for horticultural honors. The eagerness

oant in size, but even the least has a right to its name.

In one case I saw in a widely advertised collection of wild flowers, a flower-cluster nearly three inches long, bright scarlet in color, labeled with the name hurr-clover. Of course one does not wish to be too particular, but the line must be drawn somewhere, and a reasonable amount of accuracy is not to be despised.

Many of our beautiful and effective plants have no common English names, and it is so easy to prefix wild to some familiar name and so band it down—a delusion and a snare to all hotanically inclined students. Most of our native flowers probably have Spanish names and musical oases, too, given by the people who have lived with them, have seen, with a poet's eye, their many charms, and have had many tender associations connected with them. These names we should preserve as far as possible, for they are usually pointed, picturesque, and perpetuate the traditions of the soil. Our madrona and manzanita are good examples of this class of names, and they seem to be popular; others, as chloolote, yerba buena, and yerba santa, are fully as pleasant to the ear.

Leaving aside these flowers as denizens of the field and of the wood, and viewing them in the

even our common hockeye with heavy blue-green foliage, would prove invaluable if properly managed. The madrona, the tree-like manzanita and the laurel have already been tried and have been heartily approved. They belong to our climate and can be disposed of in landscape gardening with as much grace and relief as the foreign tree.

For a long time it was the style to adore wild flowers, but a careful observer could see that all who adored them chose the largest and brightest or those most easily obtained; the true flower lover then as now guarded his treasures with a somewhat jealous eye.

The popularity our flowers enjoy in other places may be only another proof of the old proverb, "A prophet is not without honor," but the interest shown in the recent field flower contest among the pupils of our county proves that we do not need to hear from abroad before learning to value our home treasures.

Our State Flower.

We give on this page a portrait of our new State Flower as adopted at the last meeting of the State Floral Society.

The announcement of this action has been followed by approving comment in the public press, and in such conversation as has come to our ears. This flower of the whole year and the whole State, and in its typical species, only of the State, is by common consent crowned as the queen flower of California.

Our engraving has a botanical rather than an artistic cast. Perhaps at another time we may present a prettier picture, but just now it seems desirable that our distant readers should know just what sort of a flower has been given the scepter in California, and this can be best shown by the botanist's heartless method of analysis. Fig. 1 shows the full bloom, the style of the leaf and stem, also the pointed seed-pod, which Fig. 2 shows as opened when still green, and Fig. 3 presents the pod as it naturally opens when dry and mature. Fig. 4 is the upper part of the seed-pod before opening. Fig. 5 is a seed magnified and Fig. 6 is a section of the same, showing the germ, while Fig. 7 shows the germ more highly magnified. Fig. 8 shows how the stamens are attached to the petals of the corolla, and Fig. 9 is a cross-section of the unripe seed-pod.

In connection with the engraving which will introduce our State flower to those who do not know it, we cannot do better than reproduce the closing paragraphs of Miss Pratt's essay, read at the November meeting of the Floral Society, which well portrays some of the characteristics of the flower that entitle it to the distinction it has received:

In choosing a floral emblem for a State, it is desirable that the flower should be a native, and not only widely distributed but striking, so that everybody may thoroughly know it, and that it will be among the first to attract the attention of the children and so connected with their earliest memories, but that it should be beautiful, easily represented in paintings, carvings or architectural designs; and for this State it seems specially desirable that the flower should be golden in color. All these requirements this little blossom fully satisfies. The typical flower is found only within our borders, though varieties occur as far north as Washington and southeast to Texas—about 10 in all, varying in manner of growth, color or both; but the Eschscholtzia, as we know it, is never found outside of our State. One has only to watch the children coming home from a trip to the country to see which flower they love best. It is one of their greatest delights to pick a whole armful, and the quantities the florists gather and bring to the city show that the older people fully appreciate their choice. No other California wild flower is so widely known or so highly prized as this, and surely no other has been painted so many times.

Both flower and foliage are well adapted for carving or decorating our buildings or banners, and who can describe its color? All the golden emblems of the State combined seem to be needed to give this wonderfully glistening, brilliant, intense coloring, which after all can never be represented, and, like so many other wonders, people must come here and see to fully appreciate.

STATISTICS compiled by the *Railway Age* show the construction during 1890 to be about 6080 miles, as against 5200 last year. Over 2000 miles of road under construction are in the Southern States and over 1000 in the Northwestern States. The Northwestern show 1057 miles, due largely to active building operations of the Northern Pacific and the great Northern roads.

FIFTEEN HUNDRED employees at the Pullman Works who work by the piece in the car-shops have been notified of a new scale of wages, to take effect on the first of the year, amounting to a reduction of about ten per cent. Two hundred blacksmiths have quit work, pending arbitration with the company. The other employees seem inclined to accept the scale quietly.

THE property of the Benton Consolidated M. Co. was sold on Saturday last by the sheriff under an execution on judgment in favor of the Alta M. Co. The property was bid in by the plaintiff at \$9666.70. Under the law the Benton Company can redeem the property within six months.

OUR STATE FLOWER. THE CALIFORNIA POPPY — *Eschscholtzia Californica*.

with which plow-goers storm the preserves of the tiger-lily is a lasting tribute to its beauty and grace. But—alas! the cow is just as fond of it, and only what they cannot reach is left for the human flower-lover. We respect the craft of the thistle now, and wish for armor for the lily.

In our hasty survey, we can pay only a passing tribute to the beautiful members of the pea tribe which flourish among us. In richness of color and in variety they are surpassed by few other flowers, and as it is always a pleasure to see a well-known face in a crowd, so we are glad to come across the familiar butterfly petals in a wilderness of new plants. The lupines, yellow, white and all shades of blue and purple, with occasionally a pink stranger, the clovers, the vetches, thermopsis and a host of kindred with most unusual names, are among the gems which brighten our fertile land.

On the subject of names let me present a brief plea. One is debarred, of course, from speaking of the scientific names; they are settled, and as far as one can judge, well settled. But the local names, the home names, are insufficient and so loosely applied that it is simply exasperating to try to verify many of them. There are a number of pretty names afloat which are applied to many flowers, as blue bells, wild pansy and wild forget-me-not, and there seems to be no particular flower that can prove its claim to the name. For instance, the name wild heliotrope is given to several widely varying plants, and there is a true heliotrope, rather insignifi-

sacrilegious light of transplanting, our query is: "Which of these are suitable for cultivation?" This question has been answered for us in a great measure, for in many catalogues of Eastern growers our flowers are well represented. Among them are the California poppy in its yellow and gold and its developed cardinal cousin, the nemophila, in all shades and sizes, the limnanthea and the Mexican poppy, which has recently become a favorite, while the Romneya Coulterii, with its great orange-like white blossoms, has won a lasting reputation for itself.

The tiger lily, the azalea, the rhododendron, where it will bear transplanting, the spires, the clematis and the scarlet gooseberry, under the ambiguous name of coral plant, have already enriched our gardens, and where one can withdraw himself from the worship of varying forms of our common garden flowers, he will find these most charming companions. They give a wild, airy air to a garden, but it must be acknowledged that they look as if they felt degraded and longed to escape.

The salmon berry, with its red flowers and luscious-looking fruit, seems to be challenging one to a feast worthy of the gods; maybe the gods could eat them, but at present they are rather sour for the human palate. Culture ought to do something for them.

In our forests grow trees and shrubs that would lend themselves favorably to artistic gardening, as the chinquapin, with its gold-lined leaves, the California nutmeg or yew, and

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PIONEER.—Amador Ledger, Jan. 3: For the last three weeks prospecting operations have been carried on at the Pioneer claim, which adjoins the Kennedy on the south. The old shaft, 70 feet deep, has been cleaned out, and drifts run north and south. About 60 tons of quartz has accumulated on the dump. In the north drift the ledge is four feet wide and in the south drift, from one to two feet in width. The ore is reported to be of fair quality. The ledge matter in the North Star has again been struck and the hopes of the stockholders are once more in the ascendant. The Amador mill, running on ore from the Doyle claim, has come to a standstill. A cleanup has been made, but the exact amount obtained we have not been able to learn.

PLYMOUTH.—The Plymouth Consolidated is working along as usual. The New London mill keeps crushing away. The mine keeps digging out enough quartz to supply the mill; how it yields I am not informed, but very likely the ore is low grade. The War Eagle mine, operated by George Lamb & Co., is drifting and report says that they are taking out some pretty good rock. There is a good deal of assessment work being done, which helps to keep a little life in the town.

VOLCANO.—We learn that Mr. Fink has sold his claim, situated two miles east of town, to a company from San Francisco, the purchase price being \$20,000. Machinery is now being erected on Antone Reale's claim in Forty-nine flat; a dozen or more men are employed there.

Calaveras.

GOLD.—Mountain Echo, Jan. 1: A piece of gold weighing less than a pound was picked up in the road near Chinatown last Monday. Owing to the breaking of the Union Water Co.'s ditch in the mountains the Uteca mill has been closed several days during the week, but was started up again last Tuesday. We are informed that the Bruner mine, located near Albany Flat, about two miles from this town, has been bonded to a San Francisco company, and that the company will proceed at once to develop the property.

Mariposa.

GUIDING STAR.—Union Democrat, Jan. 3: A visit was lately made by Dr. Gould and Messrs. Stanley, Lindley and Blanding to the Guiding Star Mine, in Mariposa county. The ores taken from the several openings on the mine show well in free gold. The vein is of good size, the formation is slate, and all the indications point to permanency. The owners have given Messrs. Gould, Blanding and Stanley a bond on the mine. They think well of the prospect for a profitable mine.

Nevada.

THE OMAHA.—Grass Valley Union, Dec. 31: Since the addition of eight new stamps to the Omaha mill, making 28 in all, a great deal of quartz is being reduced. Of the full head of stamps 18 are running on ore taken out by the regular force of miners and eight on the rock of the tributaries. There is plenty of fine rock in the Omaha, and the average yield per ton for the past year has been higher than that of any other mine in the district.

BANNER.—Nevada Transcript, Dec. 30: J. E. Brown, manager of the Nevada City water works, who has for several months past been in San Francisco, will come back here as soon as he is able and resume the work of reopening the rich old Banner quartz mine, which enterprise has been temporarily interrupted by his ill health.

GREASED THE ORE.—Transcript, Dec. 27: Wm. Berry, working on tribute at the Gold Tunnel mine in this township, recently took out a crushing of such ore as ordinarily yields \$45 to the ton. He sent it to mill, and the crushing yielded only about half as much bullion as it should under favorable circumstances. An investigation showed that some malicious person or persons had "greased" the ore before it was hauled away from the mine, and a large part of the gold had been washed away in the amalgamating process.

THE ORIGINAL EMPIRE.—Grass Valley Telegraph, Dec. 26: The owners of the Empire mine have reasons to be glad this Christmas-time, for never, in the history of that famous old mine, has such rich ore come from its depths. This morning the miners ran on to specimen rock in the 1500 level and they were taking out specimens up to about noon. What they did this afternoon we have not been informed. One piece of quartz alone, taken from the mine this morning, is valued at \$1000, and it is stated the whole amount reached will foot up into the thousands. The Empire is the oldest worked quartz mine in the county.

Plumas.

GRAVEL.—Cor, Greenville Bulletin, Jan. 3: Mr. Swiggett, who is in charge of the Slate Creek mine, between here and Spanish Ranch, has a full crew of men at work and the tunnel is being pushed along rapidly. Gravel is expected pretty soon. The Hungarian Hill boys are running a tunnel. They are in a good deposit of gravel.

San Bernardino.

TIN.—Inyo Independent, Jan. 2: O. I. Mairs of Independence took a trip from Bakersfield to the tin mines in San Bernardino county, not far from Riverside. He says a very large amount of capital has already been invested in developing the mines. Extensive buildings are erected, the best of machinery is there, good roads are made, and what is of most importance, the mines are well developed. He was assured that there are large bodies of tin ore in sight richer than the ore of the mines in England. Everything indicates mines of great extent and value.

San Diego.

THE HELVETIA.—Julian Sentinel, Jan. 2: Since Mr. Havermale has taken charge a ten stamp quartz mill has been erected and is now in running order, and being run on ore from the High Peak mine, which he is also prospecting. He has two 40 horse power hoists, hoisting machinery, two engines, a 10 horse power for the hoist and a twenty horse power for the mill. All the machinery is inclosed in good buildings. He has built a retort, assay office, blacksmith shop, two 10,000 gallon water tanks, a resi-

dence and office, hoarding and bunk houses and a barn. The new shaft is down over a hundred feet. Large bodies of ore are known to exist in the old works, and Mr. Havermale is rushing the work of getting it out. He is also spending considerable money in prospecting the High Peak mine, which he will purchase provided it proves satisfactory. He has twenty-six men on his pay roll, and pay days are as regular as clock-work. When the mine is properly opened he will employ 60 or 70 men.

Shasta.

DOG CREEK.—Shasta Democrat, Dec. 31: Joe McCourt, a miner on Dog creek, was in town last Saturday. He gave us a good account of the mining developments in that camp. There are in all 30 claims located, all of which prospect more or less. Considerable development work has been done on several of them in the shape of shafts and tunnels, which have encountered pay chutes of good ore. A recent discovery on the head of Chase gulch by Asa Elson and T. O. Roberts is said to be great, the croppings of which yield hand-mortal rock. Mr. McCourt showed us specimens of gold telluride ore taken from one of the mines that is very rich. The showing in this camp indicates that a number of big bullion-producing mines will be developed there the coming summer. We are informed that the Brown Bear Co. of Deadwood is negotiating for a group of claims there, and if this company should take hold the camp will boom.

FOUND IT.—Courier, Jan. 3: David Pesenti, who some time ago sold mining property to Dr. Garlick, recently purchased a "prospect" from another person, on a two-foot ledge on surface, situated on a hill above Dry creek, north of town. David is a worker from the start and strong as Goliath of old, and set to work developing his claim. He has run a tunnel in, which taps the ledge 30 feet below the croppings, and finds the ore at that depth looking fine, and the wall rock well defined. The ore assays \$87.90 gold and \$2.40 silver. The owner has run a 30-foot crosscut on the ledge, and named the claim the Live Oak.

Slakiyou.

QUARTZ.—Yreka Journal, Dec. 31: Messrs. Lawson & Fahl, who have been working a newly discovered quartz ledge on Old Craggy mountain, in the Humburg creek district, had a cleanup last Thursday of a quantity of quartz crushed, and were very well satisfied with the yield. They will continue the work of opening the claim in a systematic manner, and secure another batch of rich quartz for crushing when the roads are good for easy hauling, or sufficient snow is afforded for good sleighing. The Spencer mine at Humburg still continues to improve in extent and richness, as work on the ledge progresses. This ledge is destined from indications at present to become one of the richest paying mines on the coast. Lee, Lash & Co., continue to find an extensive deposit of blue gravel in their claim on Greenhorn creek, about a mile south of Yreka, having traced it a distance of 40 feet, at 80 feet below the surface, and varying from 5 to 7 feet thick. They are now sinking the pump shaft 4 feet deeper, so as to drain the gravel to better advantage, and have also set up hoisting machinery, which can be worked by the engine pumping out the water. The blue gravel wherever found in the county has proven exceedingly rich, and is an underlying strata existing throughout all Northern California and a large portion of Southern Oregon. A carload of quartz has been shipped to San Francisco from the Spencer mine on Humburg, via Yreka, as an experiment, to ascertain how much better it will pay by more scientific working in that city. Should the experiment prove profitable, it might be the means of an extensive business for the railroad company, which ought to make a low freight rate for mineral ore, as the Central Pacific granted the silver miners of the State of Nevada. There are numerous quartz-mills in this county, from which the finest gold escapes, but could be saved if we only had chlorination works to reduce the sulphurets and gold to a liquid state. Several lots have been sent to San Francisco that paid very rich, it being impossible to save the finest gold on the quartz-mill plates, especially at ledges where the influence of quicksilver is neutralized by arsenic, soda and alkalies in the mine.

Tuolumne.

NOTES.—Cor, Union Democrat, Jan. 3: The App mine, situated at Quartz Mountain, on the mother lode, is, so we are informed, paying well. The last run yielded \$33 per ton, with a large quantity of rock equal in richness in sight. The Dutch mine, an extension of the App on the north, is also looking well, some of the rock being rich enough to pay working it in a hand mortar. The new ten-stamp mill on the Hyde mill is near completion. Some very rich rock showing heavy coarse gold, taken from the pocket lately found in the Cosmopolite mine, near Groveland, was brought to Sonora a few days ago. The parties having the lease on the mine from Mrs. Dorsey are confident of good and lasting profits. Machinery for the new shaft on the Buchanan mine passed through town last week. At the Golden Gate mine an experimental test is being made with a Garnier concentrator. If the result is satisfactory, it will be accepted. The Kanaka mine and mill are now in condition for work. The mill will start as soon as sufficient water is obtained and this will be very soon, for our winter rains have come. The Badger mine in this county, situated nine miles west of Sonora, is being energetically worked. The San Francisco parties who have a bond on the mine are reopening the old shaft, and at a depth of 170 feet have found very rich rock going into the hundreds of dollars per ton. The vein at this depth is five feet in width. The north and south extension of the mine also show well. The Badger mine was worked years ago with profit to the owners. The ore below became heavily sulphureted and for want at that time of some practical, economical mode of treating the sulphurets, the mine was abandoned. The want no longer exists, for sulphurets ore are now worked to a high percentage of assay value by simple methods at small cost per ton.

NEVADA.

Eureka District.

THE DIAMOND.—Eureka Sentinel, Jan. 3: Several loads of ore have been shipped from the new tunnel. The main tunnel is still being driven ahead and does not deviate to the right or to the left. The hunches and stringers of ore that have

been encountered are encouraging, but there has not been sufficient prospecting done to determine their extent.

THE WIDE WEST.—Major Kinney has for some time been carrying on prospecting work at the Wide West. He has finally concluded to suspend operations there until spring. Accordingly the men were knocked off during the week.

ORE SHIPMENTS.—During the week the Eureka and Palisade Railroad Co. shipped 95 tons of ore to the Salt Lake City smelters.

Washoe District.

OCCIDENTAL.—Virginia Enterprise, Jan. 3: The work of repairing the track and timbering is progressing with all possible dispatch. The south drift from the bottom of No. 5 winze on the 650 level is in 74 feet, and continues in low-grade ore. Milled during the month of November 1440 tons of ore of the average value of \$20.45 per ton, from which was produced in bullion and concentrates a total of \$25,879.

SILVER HILL.—On the 160 level the northeast drift from the winze continues in porphyry.

CON. NEW YORK.—On the 850 level the north drift from No. 1 crosscut is still being advanced in a porphyry formation. On the 1100 level the north drift is passing into a mixture of quartz and porphyry.

OPHIR.—Some milling ore is still being obtained from the west drift, 122 feet below the 1300 level.

MEXICAN.—East crosscut No. 1 on the 1465 level is still in very hard rock.

ALTA.—The mill is still kept running to its full capacity, crushing about 300 tons of \$18 ore. The usual amount of prospecting work is being done.

YELLOW JACKET.—Are extracting and milling about 300 tons of \$18 ore a week. A good deal of exploring work is being done.

CHOLLAR.—Are sinking a winze on the 750 level to connect with the 850 level. Extracted and sent to the mill the past week 545 tons of ore; average battery assay, \$21.65 a ton.

EXCHEQUER.—East crosscut, 150 feet south of north line, 500 level, is out 366 feet; face in clay and porphyry. East crosscut near the south line, 600 level is out 210 feet; formation, quartz, porphyry and clay. South lateral drift, 600 level, is out 625 feet, face in quartz and clay.

ALPHA.—The east crosscut, 70 feet north of shaft, 600 level, is out 240 feet. Face in black porphyry.

POTOSH.—The south drift from the main incline on the 1230 level is in 185 feet; face in quartz giving fair assays. The south drift on the 1300 level was advanced 33 feet; total length, 458 feet.

ANDES.—During the past week north drift, 420 level, was advanced 15 feet through a formation of porphyry and clay. South drift, from main west drift, 420 level, was extended 10 feet; formation, clay and porphyry.

CON. CAL. & VA.—Ore continues to be extracted from the 1200, 1300, 1500, 1600 and 1650 levels. A considerable amount of exploration work is also being done in the mine. About the usual number of tons of ore will be sent to the Eureka mill, and averages a little over \$18 a ton.

UNION CON.—No. 2 crosscut from the north lateral drift on the 1465 level is being advanced in a soft and favorable porphyry formation.

SIERRA NEVADA.—The northwest drift from the 630 shaft station is making good headway in a porphyry formation.

HALE & NORCROSS.—On the 800 level the west crosscut was advanced 20 feet, making a total of 205 feet, face in porphyry and seams of quartz. On the 900 level the west crosscut over north boundary was advanced 15 feet in hard quartz giving low assays. This crosscut is now extended 70 feet; face shows some water. On the 1100 the north drift was advanced 15 feet, making its total 230 feet; face continues in hard porphyry. The northeast crosscut on this level was advanced 20 feet, making its total 200 feet. We have saved 11 cars of ore from this crosscut during the week.

SAVAGE.—During the week we have hoisted 639 cars of ore from the 300, 400, 500, 600, 750, and 1300 levels. Shipped to the Mexican mill 553½ tons; ore milled, 620 tons; average battery assay, \$16. We have bullion on hand amounting to \$27,692.10. The winze station in the ore body from the track floor, 1300 level, is down 30 feet and continues in ore of good quality. We have finished the station for a hoisting engine at the top of the winze. The engine hoist is in place and we expect to have it running in a few days.

SEG. BELCHER.—The south drift from Belcher shaft, 600 level, is now out 20 feet from Belcher south line, face in porphyry.

JUSTICE.—The north drift, 822 level, is out 171 feet and is in hard rock. The north winze, 622 level, was sunk 10 feet the past week and is now down a total depth of 18 feet; bottom in good milling ore. Shipped 160 tons of ore; battery assays, \$22.46.

KENTUCK.—The week has been occupied in timbering the tank station on the 167 level and grading down the east drift on the 1000 level to correspond with the Crown Point drift on the same level.

CROWN POINT.—Are extracting from the 1800 stoppe from 8 to 10 tons of ore per day that assays from \$18 to \$20 per ton.

CONFIDENCE AND CHALLENGE.—The joint Confidence and Challenge north drift on the 300-foot level is now in 130 feet, 20 feet having been made during the week. The face still shows two feet of fair ore. The joint Confidence and Challenge raise from the 750 level is up 106 feet. The top is in quartz having no value. Work on the main north drift on 1100-foot level has been suspended for the present, and from its north end a west crosscut has been commenced, which is in 28 feet. The face of this crosscut shows quartz having no value.

WEST COMSTOCK.—Good headway is making in the construction of the road leading from the lower tunnel to the Ophir grade.

UTAH.—The north lateral drift is still being advanced in a formation consisting of quartz, clay and porphyry.

OVERMAN.—Extracted 424 tons and 1600 pounds of ore. Shipped to the Brunswick mill 443 tons and 1900 pounds of ore. Battery assays average \$16.55 per ton.

CON. IMPERIAL.—West crosscut No. 2 on the 1000-foot level is now out 248 feet. The face is in quartz having no value. A great deal of work is being done on the other levels of the mine in following up and taking out small streaks of ore.

BELCHER.—West crosscut No. 1 from the shaft is out 461 feet, having been advanced 11 feet during the week; face in quartz and porphyry. The south

drift from crosscut No. 3 has been advanced 20 feet during the week, making a total distance of 58 feet; face in quartz and porphyry showing spots of ore. Work in the crosscut on the 1400 level has been discontinued and a raise started from this level to connect with the winze from the 1300. The raise is up 10 feet; face in quartz giving low assays.

BEST & BELCHER.—800 level: West crosscut No. 2 has been extended 14 feet; total length, 396 feet; formation, porphyry, with streaks of quartz, 1200 level: At a point in upraise No. 1, 100 feet above this level, started a west crosscut No. 1 and extended it 25 feet; formation, hard porphyry.

GOULD & CURRY.—Northwest drift extended 15 feet through old filling of fair quality of ore; total length, 175 feet. 400.—West crosscut No. 3 extended 25 feet; total, 85 feet; face in clay, porphyry and quartz showing some value.

Hot Creek District.

SILVER.—Belmont Courier, Dec. 27: Messrs. Merritt and Wager are extracting good silver ore from their mine in Hot Creek district which is shipped to Salt Lake City for reduction. The Anderson Brothers have discovered some rich silver ore in their mine in Hot Creek district. They will develop the new find shortly.

Spanish Belt District.

QUICKSILVER.—Belmont Courier, Dec. 27: William McCann is engaged in developing a quicksilver mine at Spanish Belt, Nye county. Some of the samples of ore are very heavy and carry cinnabar in good quantities.

Pioche District.

RAILROAD AND MINES.—Salt Lake Tribune, Dec. 30: Mr. W. S. Godbe, president of the Pioche Con. Mining and Reduction Co., returned yesterday morning from an extended business trip East. It was learned from him that owing to the temporary suspension of the railroad extension from Milford, matters in Pioche cannot be pushed with the same energy or on the same scale as they otherwise would have been in that somewhat remote but attractive district. Work, however, on the principal mines will continue and additional ore resources be shown up, so as to be ready for shipping in large quantities as soon as the road gets there. The company can smelt a portion of its ores at Pioche to advantage and make money, but a moderate profit does not seem to satisfy this mammoth concern when, with railroad communication and the facilities that will then follow, an income commensurate with the magnitude of the property may be secured. In answer to an inquiry as to the prospect for the early completion of the road to Pioche, Mr. Godbe said that the grading of the main line of railroad from Milford to Pioche has been completed at a cost scarcely less than and probably exceeding a million dollars. A few miles of track have also been laid from Milford, but owing to the urgent need of men and rolling-stock on the mountain division of the Union Pacific road a short time ago, this important work had been suspended. Its resumption, however, at an early day may be looked for with confidence, as it is hardly reasonable to believe that the great amount of traffic resulting from this extension will be neglected or lost sight of, especially after so large a sum has been expended toward the attainment of this object and when so little more is needed to secure it. In view, therefore, of the early completion of this road, the trustees of his company believe it is better to do the best possible with present facilities and make preparation for adequate expansion simultaneously with the advent of the locomotive.

ARIZONA.

HARQUA HALLA.—Phoenix Gazette, Dec. 30: From Harqua Halla we have received the following communication: Hubbard & Co. are building roads and grading for their large reduction works. The machinery to the amount of 500 tons is now being unloaded at Sentinel. Lehi and Rosmer have opened up three fine bodies of ore in their mines. C. H. Gray and George L. Davis have done the annual assessment work on two fine gold properties with gratifying results. Quinn & Co., besides opening up some fine properties of their own, are doing annual assessment work on three gold properties for Kinney and Flaherty of Phoenix. A San Francisco company has purchased the Socorro mine and is working a force of men on the same preparatory to erecting a 10-stamp mill. Harrington & Co. are doing annual assessment work on two properties that prospect well in gold. The Harqua Halla Consolidated G. M. Co. is taking out ore from its numerous properties to run through Harris mill for the gratification of an English company which is negotiating for the purchase of this property. A large body of rich ore has been uncovered in the Seelig mine, owned by Seelig & Co. of Phoenix. The Sadie Wentworth mine shows a large body of rich ore. This mine is owned by Fred Wentworth & Co. Both mines are on the same mineral belt as the great Bonanza mines, and only a short distance therefrom. We look for a lively camp here this winter.

AROUND PRESCOTT.—Courier, Jan. 2: Supt. Helm is about ready to commence hoisting ore out of the Tiger. W. M. Clappold, manager of the Prescott ore works, tells us that he is shipping one car of concentrates for J. I. Roberts, of Walker district; a lot of gold ore for Frank McCahe, of Big Bug; concentrates for the Crowned King, in all about five carloads. The last shipment of White Spar ore yielded about 250 ozs. silver to the ton. Chas. M. Clark, who yesterday returned from a two-months' trip to Chicago, Kansas City and Denver, while in the latter city bought machinery for the Silver Belt mine. We are indebted to W. A. Linn for the following concerning mines owned by Frank McCahe and others, in Big Bug district: The Gladstone, a large, strong vein, is opened by a tunnel commencing at the surface and extending along the vein a distance of 135 feet, gaining a depth of 70 feet at face of tunnel; also a shaft 40 feet below level of tunnel, showing the same quality and character of ore as is found above. The vein has a uniform width of fully five feet, containing but little or no waste at any place yet exposed, with upward of 200 tons of ore now on the dump, which, from careful and frequent samples and assays, should yield, at a low estimate, \$40,000. Wecker & Snapp, owners of several ledges in Hassayampa district, are sinking deeper in their Mountain Star, which they think is really better than their White Spar Mine. Quartz Mountain mine is in prime condition. There is in it a large chimney of very rich

gold ore. Frank McCabe of Big Bug district was at the Prescott ore works recently with ore from the Gladstone mine which sampled \$146 per ton in gold. Fred Little, John S. Jones and other miners are opening promising veins east and west of McCabe's mines. Talk is that work will soon be resumed in Groom Creek district. Lynx Creek hydraulic miners are sending a great deal of worked-out gravel down the stream. Farmers are already talking of having some of their land covered by slickens. Ed L. Johnson and Mr. Waterman claim to have a very rich gold ledge near Walnut Grove. A large copper ledge was recently found in the Mazatzal mountains, in this county, we think. The ore carries some gold. The Copper Queen Co. has just put up over \$70,000 for the Neptune group. Mr. Farish is shipping fine ore from the Phoenix mine.

HACKBERRY.—Mohave *Miner*, Jan. 3: Ikc Conkey was down from Hackberry this week and reports that the old Hackberry dump is doing well for Conkey & Young. Steve Henkle and Dan'l McGlone have a lease on the Tuckaho. The mine is looking well. C. H. Park, superintendent of the Queen Bee, was in Kingman Thursday. The connection has been made in the shaft and drift, and the mine has lots of good ore in sight. Mr. Park is not satisfied with the present depth of the shaft and will sink it 100 feet deeper. The assessment work was done 00 more claims this year than in any year in the history of mining here. In comparison with other years fewer locations were made on the first of the year. Miners are beginning to realize the value of doing assessment work on their claims. There is but very little ore in sight, and teamsters and sampling works are experiencing a dull season. Gilliland, Darden & Co., lessees on the Empire mine, made another strike of rich ore. The pay streak is two feet wide. Steve Smith's claim on Sursum's Peak is looking fine. The pay streak is widening out and carries considerable native silver.

BRITISH COLUMBIA.

A TWO-FOOT LEDGE ON ANDERSON CREEK.—Nelson *Miner*, Jan. 2: On the head of Anderson creek, about three miles due east from Nelson, J. P. Lamotte and his partners are working on a claim named the Cub. They have a two-foot ledge, the pay streak varying in width. A tunnel is being run in on the ledge, and it is now in 25 feet. Work will be continued all winter.

PEACOCK AND GRAY COPPER.—Jim Fox, one of the owners of the Dandy, reports the shaft on that property down about 40 feet, with three feet of ore, fine peacock and gray copper, in the bottom of the shaft. Little trouble is now had in handling the water, and Mr. Fox is more than sanguine that the Dandy will yet be one of the big mines of the Toad Mountain district.

TRAIL CREEK.—The incline shaft on the Lily May is down 30 feet, showing a three-foot ledge of cube galena. Five men are at work on the Le Roi, and the same number on Springer's claim. Perdue & Stewart are sinking a shaft on the Zlor, a claim that is believed to be second to none in the camp. About 40 men are wintering in the district.

RICH ORE.—While the Blue Bell is the only property on the east side of Kootenay lake developed into a mine, good ore is brought in for assay from several claims in that district. Bryan, the assayer at Ainsworth, reports that the richest ore he assays comes from over there—the ore being free milling and carrying ruby silver.

WILL WAIT UNTIL SPRING.—Owing to the difficulty of getting in machinery, the work of sinking a shaft on the Little Donald will not be commenced until spring. The owners of the Krao, another Hot Springs property, have also decided to await spring before starting up its machinery. It is reported that the latter mine will be stocked.

WORKING THREE SHIFTS.—At the Skyline, in the Hot Springs district, work was resumed on the two-compartment shaft now that the steam hoist and pump are in position. Three shifts are run, with Tom McGovern and Alec McLeod as foremen to charge and Dr. LaBau and Joe Petty as engineers. The shaft is down nearly 100 feet.

THE SILVER KING TUNNEL.—The tunnel on the Silver King was in 316 feet on Sunday last. A foot of rich-looking ore is now in sight on the floor of the tunnel. The rock continues hard.

COLORADO.

DREXEL TUNNEL.—Colorado *Mining Gazette*, Dec. 27: The Drexel tunnel has been commenced and will be pushed into Saxon mountain as rapidly as possible. The object is to intersect and develop the Pickwick group of mines. The length of the tunnel will be about 1300 feet. The Pickwick vein will be tapped at a point about 1100 feet perpendicular. This tunnel will pass through a number of other well-known mines and will be a good avenue through which to work them. A vein of stamp-mill dirt has been opened up in the heading of the lower tunnel on the Ohio Gulch M. Co.'s property, 30 inches in thickness. In the heading of the upper tunnel on Ohio mountain, a vein of solid galena, as yet but one inch in thickness and carrying yellow copper, has been exposed. As explorations progress, this property improves. The Centennial has a vein of ore 4 feet thick, 18 inches of which is good smelting ore and the remainder concentrating material in the 500-foot level. About 70 tons of smelting ore was shipped from this property last month. Fifteen tons of concentrating material is produced by the Senator mine daily. A wagon-road is now being built from Dumont to the workings. When finished it is the intention of the parties to put up a concentrating mill at the place above named. The shaft on the Baltimore mine is now down about 480 feet and is still being sunk. Upon the north wall side a vein of ore about 3 inches in thickness has been opened up of an apparent high grade. The indications are that the ore vein will continue to open as depth is gained until it is of such a size that the record of this property will stand among the leading producers of Clear Creek county.

THE ST. JOE.—*Aspen Times*, Jan. 3: The first of the year has witnessed the resumption of work on the St. Joe and Mineral Farm. Yesterday a large force of men was set to work in the mine by Manager Mike Murphy. For some time he has been getting ready to start up, but a great deal of preliminary work was necessary. It has been some time since the property was worked and it had gotten out of repair, and the incline had filled up with

water for about 20 feet. It was only yesterday that men were set to work in the bottom. The new company that has taken hold of this property has made calculations to develop it on a gigantic scale. They will sink the incline down and prove up the ore bodies that are exposed in the upper levels. Their lease requires them to do at least 400 shifts a month and this will necessitate the steady employment of 18 men. Developments in this property will be eagerly watched by all mining men, for on it will depend the value of a large area.

THE EDISON NO. 2.—The developments in the lease on the middle section of the Edison, known as the Edison No. 2, have been going forward steadily since the ore body was struck there, and the showing made is most satisfactory. The lease has been paying expenses for some time, but no effort has been made to take out anything in excess of the needs of the pay roll. It is expected, however, that a large production will be made during January and succeeding months. One of the lessees informs the *Times* that the development work done since the discovery of the ore body has blocked out mineral to the estimated value of \$70,000.

IDAHO.

THE STRIKE IN THE VENUS.—Wood River *Times*, Jan. 3: The ore-vein cut in the lower workings of the Venus mine, a couple of weeks ago, still holds out, and now shows a width of three feet, carrying rich streaks of sulphurets of silver, iron and gray copper. As the Venus is famous for the high grade of its ore, there can be no doubt but that what is already in sight will yield a large amount of money when extracted and sold.

THE RED CLOUD.—The third monthly dividend of the Red Cloud Mining Co. was declared at Pittsburgh, Pa., where the principal office of the company is located, the 15th inst. It was of \$10,000. This makes the third consecutive monthly dividend of \$10,000 declared and paid by this company, and, if rumor is correct, its ore bodies promise to pay several more.

THE DALY'S MONTHLY DIVIDEND.—The Daly Mining Co. has declared its regular monthly dividend for November. It is of the usual amount—\$37,500—making a total of \$450,000 per annum. No business pays as large profits as a properly conducted mine.

SILVER MINES OF MURRAY.—Murray *Sun*, Jan. 3: On Saturday a *Sun* reporter, in company with a gentleman friend, took a trip to some of the claims on Upper Prichard creek. Proceeding up the north-west branch about one-third of a mile, the discovery tunnel of the Paragon was reached. The face is in about 34 feet from the place where ground was first broken, and is at least 25 feet underground. There is at least two feet of solid galena—shipping ore—and all of four feet of concentrating ore besides. The ledge is over six feet wide. The concentrating ore is a dolomite formation, with stringers of galena and silver thickly running through it. Both foot and hanging walls are of slate. Under the hanging is a soft gouge of rich ore and on the footwall another gouge is found, making the ledge a very easy one to work. A slip or seam divides the shipping from the concentrating ore, so that there will not be the least difficulty in assorting the two grades. This ledge cuts the formation squarely across, and from every evidence is a true fissure vein. On the dump there are about 25 tons of shipping and about two tons of concentrating ore. Another tunnel has been started 25 feet above the creek, and the owners calculate that by running in 150 feet they will tap the ledge at a depth of 130 feet. There are several extensions of this ledge owned by different parties. Messrs. Stevens Bros. and Sims own the Huntche on the east, and Kincannon and Warren own the one still farther east, the St. John. On the west, Messrs. Cook, Tibbals, Sheehy and Tilden have located the Joe Cook claim, while Warren and Kincannon have put their stakes on the Old Pipe ledge. These are all on the same ledge as the Paragon. The latter was located some six weeks since by Chas. W. Tilden, and his partners are County Auditor Tibbals and his deputy John P. Sheehy. The next claim was the Barton, now being worked under bond of Col. J. M. Haskell, a mining man of many years experience on the Pacific Coast States and Territories. Under the guidance of Col. Haskell the party climbed the hill to the Barton tunnel. Its mouth is about 90 feet from the bed of the creek. The face is 140 feet. Mr. Haskell calculates that he will have to run 575 feet in order to tap the ledge at a depth of 362 feet below the discovery. The formation through which he is running is quartzite.

MONTANA.

BOULDER NOTES.—*Age*, Dec. 31: The Boulder sampling works sent a car of ore to East Helena the past week and is loading another car for the same place. J. J. Holmes is putting in the winter developing a quartz lode in Peters gulch below Comet. He has a tunnel in 40 feet and expects soon to strike the lead. The Bigfoot M. Co. is to be reorganized early next month and considerable development work is likely to be done on the Bigfoot mine early in the spring. All work on the Ida mine in the Willow Springs district has been suspended for the winter except some contract work which is being done by Peter Mack, the foreman. The shaft is down to water level, 200 feet. In the spring Messrs. Harris & Beattie will put on pumps and steam machinery and sink 100 feet and then crosscut to the lead. There are two veins on the surface of the property something over 100 feet apart. At the present depth of the shaft they have approached within 15 or 20 feet of each other, and it is thought that the crosscut from the 300-foot level will strike the vein at least 50 feet below the junction of the two. After striking the vein with the crosscut, drifting will be done and this will decide whether the owners have a mine or only a prospect. It is to be hoped that the former will prove to be the case. Such a result would cause an immense development of mining properties in that district.

SWEET GRASS HILLS.—Montana *Mining Review*, Jan. 3: Reports from the Sweet Grass Hills indicate that considerable development and representation work is still going on in that section. The Jumbo, a copper property, located on East Butte, near Corral Creek, is said to be making the best showing yet made in the Hills, and it is the intention of the owners to continue development work on this property all winter. The Great Northern con-

struction trains are now less than 20 miles to the south of these claims, but track-laying is said to be progressing slowly on account of the scarcity of labor.

THE EMMA NEVADA.—*Inter-Mountain*, Dec. 31: A mining deal has been consummated in the past few days which places the control of the Emma Nevada mine in the hands of John Helehan and a party of gentlemen in this city. A carload of ore from this mine was recently treated at the Parrot smelter and yielded 79.4 ounces in silver and .94 in gold to the ton. The ore is of a fine milling character, and contains sufficient gold to pay all expenses if the company had the means at hand to treat the ore. The work this winter will be confined to development, as the company intends to fully ascertain the extent and quality of the ore bodies before erecting works. Preparations for sinking the shaft to the 200-foot level are almost complete, and work will soon be commenced. Further than the shipment of an occasional carload of ore to pay operating expenses, the company will not extract any ore. Last week George Long and A. Wilmott visited the mine and were quite favorably impressed with it. They reported the lead seven feet wide at the 50-foot level, and took away some very rich specimens of horn silver ore. A tunnel is being driven on the south lead and above the level of the shaft, and is now 200 feet. The pay streak is about eight inches wide and a sample taken from the ore by the gentlemen named, assayed 1549 ounces of silver and \$6 in gold to the ton. The shipments of ore made during the past few months to this city show it to be of a high grade, running from \$100 to \$200 per ton. After the lead is tapped on the 200-foot level a bright future is predicted for the property.

EAST GRANITE.—Every day develops new and important facts relative to this new and enterprising company. They have every reason to feel jubilant over the results of the past week's work. In a stope on the crosscut at 50 feet down the shaft, a vein of about 18 inches of ore that will assay high in silver is exposed, while in the bottom of the shaft numerous stringers are being passed through, indicating the presence of a big lead on the property.

NEW MEXICO.

PIÑOS ALTOS.—Silver City *Enterprise*, Jan. 3: The Pacific mine No. 1 is shipping 30 tons of ore per day to the mill located above the city. The ore is milling well and the mine is in excellent condition for working. Eight teams with trail wagon are employed in transporting the ore from the mine to the mill. The Arizona mine, lying immediately east of Pacific No. 2, is among the oldest locations in the Pinos Altos gold region, the location covering three veins, all gold bearing, and with proper developments can be made paying propositions. A tunnel has been driven on the vein a distance of nearly 300 feet, and it is believed that 30 or 40 feet farther the tunnel will reach a point where the east and west veins will unite on their dip. The proprietor, Mr. John McDonald, has for the past 20 years been working the property with a moderate degree of success, and the developments now in progress will open up the mine in excellent shape. The skill employed in the opening of the Alpha and Omega mine, belonging to Huston & Thomas, west of Pinos Altos, is meeting with unprecedented success. The Messrs. Carrera & Doheny since the inception of their management have uncovered lead riches which hitherto have had an existence possibly only in the imagination of the owners. The daily tonnage keeps a dozen or more ox teams employed.

OREGON.

SPARTA.—Cor. Brodbeck *Democrat*, Dec. 31: The melting snows are furnishing free water sufficient for "Rocker diggings," and quite a good many miners are taking advantage of it. Work on the principal mines here continues with renewed activity since the recent rich strikes in Del Monte, Oro Dell, Gray Eagle and Little Archie, and as we have always predicted, Sparta will take the lead in 1891 as the largest bullion-producer in Eastern Oregon. It is our intention in this article to show that we mean business in this camp, as the record of work done will prove. The figures given are absolutely correct: Gray Eagle and Union mines, owned by Clough & Read, have pushed their main tunnel 700 feet; two incline shafts sunk from tunnel level, 200 feet; Arkansas Belle has done tunnel work, 430 feet; Marrotte mine (Little Archie) tunnel 100 feet, and winze No. 1, 42 feet; winze No. 2, 90 feet; Napoleone (Marrotte group) tunnel, 192 feet; Windsor (Marrotte group) shaft 20 feet; Del Monte shaft will by Dec. 27th be 200 feet; Gold Ridge, incline shaft, from 150-foot level in 5 feet of ore, 50 feet; Hidden Treasure shaft, 32 feet; Gold Hill tunnel on ledge, 75 feet; Silver Queen tunnel on ledge, 72 feet; Free Thinker shaft, 20 feet; Tom Paine shaft, 30 feet; Mogue Chief, owned by Sparks of Baker City, tunnel, 60 feet; Atlantic and Pacific shaft, 60 feet; Golden Gate, below 100-foot level, 40 feet; Wiese, Buckland and Mix, tunnel, 400 feet; Wild Irishman tunnel, 400 feet; Blue Gulch, C. C. Read, tunnel, 100 feet; Blue Gulch, Detroit Co., shaft, 60 feet; Ainsworth group, E. E. Clough, tunnel, 65 feet; Ollie Woodman, shaft, 62 feet; Bill Arble mines, shaft and tunnels, 118 feet; Oro Dell, winze from tunnel level, 60 feet; Belle of Kansas (Oro Dell group) shaft, 21 feet, total, 3899. I am satisfied that at least 250 feet of shaft and tunnel work have been done on prospects that I have overlooked; yet the above is not a bad showing for "Poor old Sparta."

UTAH.

GOLD.—Salt Lake *Exchange Journal*, Dec. 31: Mr. T. A. Snell, manager of the Stewart No. 2 mine in Carr Fork Gulch, Bingham, is in the city this morning with a bar of gold bullion that is 900 fine and worth all the way from \$500 to \$600. He now has \$150,000 worth of gold ore blocked out ready to break down and ship, and believes that the mine contains an inexhaustible supply of ore running from an ounce and a half to five ounces in gold and ten ounces in silver. Mr. Snell has only had charge of this property six months, but he is doing wonders with it. Bingham is a great camp and is coming to the front with rapid strides.

Review,—Salt Lake *Tribune*, Jan. 2: The

closing of the week is coincident with the close of the month and the year. The twelvemonth has exhibited great prosperity in this mining region, as is shown in the Wells, Fargo & Co. annual report. The week just closed has shown fair production and the receipts in this city have been good. The receipts of the minerals in this city for the week ending the 31st, inclusive, were valued at \$155,083 in total, of which \$43,941 was in ore and \$111,142 was in bullion. For the previous week the receipts were to the amount of \$186,240 in the aggregate, of which \$114,910 was in bullion and \$71,330 was in ore. The product of the Ontario for the week was in ore sales, \$15,655.66; and slugs, \$1579.12; a total of \$17,234.78. The Horn Silver report shows well for the year. Its stock was not sold or quoted in New York last week, a rare omission. Fine bar receipts in this city for the week were to the amount of \$18,858; bullion, \$28,677; copper matte, \$13,000; gold bullion, \$4,000; silver bars, \$24,295; selected lead, \$3978. Ore receipts during the week in this city were to the value of \$16,606 by Wells, Fargo & Co.; \$19,350 by McCormick & Co.; \$7985 by T. R. Jones & Co.

ORE AND BULLION.—Salt Lake *Tribune*, Dec. 30: Wells, Fargo & Co. yesterday received bullion, \$7375, ore, \$6976; total, \$14,351. McCormick & Co. received yesterday Hanauer bullion, \$4750; silver and lead ore, \$5400; total, \$10,150. A two-car lot of high-grade ore from Star district, the result of James Lavelle's efforts in opening up the old Buckhorn, has just reached this city.

STAR DISTRICT.—Mr. W. S. Martin, who has just returned from Star district, reports many improvements in the mining industry of that section. Mr. M. has just completed the clearing of debris from an old location that has stood for 18 years untouched, and reports the finding of a good vein of 40-ounce milling ore. Mr. Martin is too experienced a miner and too well acquainted with some of the "dog taxes" at present connected with the handling of smelting ore to become excited over his find. He said his being a silicious camp, the call for iron, lime and lead makes the smelting charge on quartz ores, such as his, reach the neighborhood of \$26 per ton.

RICH AT DELANO.—J. J. Starbuck has struck it rich in a mining claim at Delano, out on the Central Pacific railway. He has on his I. Jay S. claim 18 inches of vein on which at a depth of 18 inches below the surface the top of the vein was broken off and assays an average of 200 ounces silver. The sample brought in is certainly a fine piece of ore. Yesterday he sent a man to begin work on it, and will employ more men as soon as needed.

WASHINGTON.

ONE THOUSAND TONS.—Colville *Miner*, Jan. 2: E. E. McArthur, a well-known contractor and teamster of Deep Creek Falls, is in the city with his teams and is making preparations to immediately begin work upon a contract to deliver 500 tons of Daisy ore on board the cars of the Spokane & Northern railway. Mr. McArthur is not pleased with the long route, along the Columbia and Colville rivers, over which he will have to haul his ore, a distance of fully 40 miles, while the distance straight through is scarcely 20 miles. His opinion is that a wagon-road can be constructed through the country from the Daisy mine to Colville, over an easy grade, at a cost not to exceed \$1000; and he says that if the Daisy Co. will double his contract, making it 1000 tons, he will build the road at once. The distance will be enough shorter to save far more time than it will require to make the cut-off. The building of this road will prove of incalculable benefit to Colville. It will open the way to the entire Summit mining district, rich in the most valuable deposits of mineral.

Please Remit.

The beginning of a new year is a good time to settle up the debts of the old ones. We are obliged to remind those who owe the PRESS on subscription account, that it will be a great convenience to us if they will soon remit what is due. Those who can also pay in advance will also do us timely and well-appreciated favor. We are doing our best to present a very valuable paper, representing carefully, earnestly and conscientiously the welfare of its intelligent readers and the best interests of the arts, sciences and mining and mechanical industries of the Pacific States.

To do this we deprive ourselves of some of the most lucrative lines of patronage available to the average newspaper.

By paying as promptly as possible, friends, you will greatly encourage us in our sincere efforts to favor you and the best interests of your calling.

POWDER.—It is reported that the pool among the local powder companies is at an end, owing to the withdrawal of the California Powder Works. On Wednesday, this company, through John Bermingham, President, and John F. Lohse, Secretary, gave notice that it would withdraw. As a result, the companies will do henceforth independently in the future, and, although prices of powder are low, they are now apt to go still lower, owing to prospective competition. The Giant, Safety Nitro, California, Vigor and Vulcan companies were in the pool, and some of the concerns have been closed down under duress. These will start again now in all probability. It has been expected that this break-up would happen, as the California Company was not fully satisfied with the arrangement which has existed.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their Scientific Patent Agency (S. F.) firm week to week and year to year.

MECHANICAL PROGRESS

A New Metallurgical Process.

Aluminum for Ten Cents a Pound.

The new Kentucky process, by which it is said aluminum can be produced for ten cents a pound, is described as follows by the Savannah Morning News:

Kentucky has a new company, just organized at Newport with \$250,000 capital, to manufacture aluminum by a new patented process at a nominal cost. It involves the use of calcium fluoride for a flux and a little calcium carbonate in a jacketed furnace. It requires about 36 hours to make the first slab. By another process, in which copper ore and old scrap, mixed with alumina clay and fluoride of calcium for a flux and a carbonate of lime and oaks are melted together, as in the first process, aluminum can be produced at 12 cents per pound. Condensed vapor comes out in the shape of slabs called aluminum bronze. This bronze is re-heated in an oven to a cherry heat without flame and plunged into a cold bath of strong salt water and glycerine, and this rapid process of heating and cooling is repeated 10 or 15 times. The re-heating causes the aluminum to melt the copper, and it comes out like heads of sweat. After the slabs are cooled in the bath, the aluminum drops are chilled and cannot get back into the copper, which is struck with a hammer, causing the aluminum to drop. Next the drops are gathered and melted into ingots.

A New Substitute for Steel.

This company will also manufacture a new metal known as *schmid barrenquiss*, meaning "a good welding metal." It is an aluminum alloy composite. It cuts as easily as tin, yet by tempering can be made to cut glass. It makes fine horseshoes. It has a tensile strength of 200,706 pounds to the square inch, and will stand an elongation of 52 per cent. This metal will do away with malleable iron and steel castings. It is made of refuse and can be produced for nine cents per pound. Should this process prove a success, it is certainly one of the most important discoveries of recent years.

A New Electric Welding Machine.

The process of welding by electricity has now become fully removed from the domain of speculation and mystery, and may be introduced into even the very small workshops of all our cities and towns. Thus through the aid of scientific investigation, the flying sparks of the village blacksmith shop may readily be replaced by the effective action of one of the most powerful and subtle agents of nature, brought under the most quiet control of even a blacksmith's boy helper.

The weld is made without smoke or noise, and with but a trifling amount of manual labor. Instead of the old method of heating two irons in a forge and hammering them together with many and heavy blows, the new method simply fuses them together with a little pressure.

Heretofore the appliance for such work has been quite cumbersome and expensive; but quite recently the Electric-Welding Co. of Boston, Mass., has devised a new, more simple and inexpensive machine, which it has been perfecting for several months, and one which is within the reach and means of all. It is adapted to miscellaneous work, and is expected to prove of special advantage to metal-workers who have a large variety of work, and whose annual product will not warrant their purchasing the larger welding plants which the Welding Co. has been furnishing. The new plants are being built of three distinct types, in all covering a range of from five square inches to one-eighth square inch section. They are furnished with a variety of interchangeable clamps. The welders can be run by any competent employe, and the simplicity of their construction and adaptability to a great variety of welding is expected to lead to much wider use of electric welding by machinists and others who do more or less welding; and desire such a machine constantly at hand ready for use. The company installs the plants, adapting the clamps to such work as may be presented, and instructs those who may be placed permanently in charge of the machines, after which there is said to be little likelihood of trouble from inexperience. The welders do not require special attention, and render unnecessary the use of the forge for any kind of ordinary shop welding.

INCREASING USES OF ALUMINUM.—Mr. Cowles of the Lockport Company, in referring to the increasing uses for aluminum recently, said: At 50 cents per pound, aluminum will compete with copper at 17 cents, for measured by volume the first is 3.56 times that of the other. The electrical conductivity of aluminum 98 fine is 75 per cent that of copper. It would therefore take about one-third more area to do the same work, but it is then much lighter. For motors for electric cars, a reduction of 45 per cent in weight can be secured by using the new metal. The coating and lasting qualities of aluminum far surpass those of tin, and aluminum would cover three times as much surface, pound for pound. Tin would have to sell for 16 cents per pound to compete. Nickel, at 70 cents per pound, would no longer be used for plated ware or coinage, as aluminum is much better and cleaner in both cases.

Mr. Cowles says that the price of aluminum will naturally fall lower and lower as the plants for making it increase and the market adapts itself to the absorption of larger quantities of the new metal. He expects to see it sell for from \$200 to \$300 per ton, and at these figures it will be the cheapest metal in use next to iron and steel.

THE LARGEST STATIONARY ENGINE in the world is at the Fredensville zinc mines, six miles south of Allentown, Pa. During the past few months it has pumped dry, by underground drainage, nearly every ore pit, spring and small stream within a radius of five miles. The engine is known as the "President," is of 5000 horse-power and is run by 16 boilers. At each revolution of its ponderous wheels a small stream is thrown out, the number of gallons raised every minute being 17,500. The driving wheels are 35 feet in diameter and weigh 40 tons each. The sweep-rod is 40 feet long. The cylinder is 110 inches in diameter, while the piston-rod is 18 inches in diameter and makes a 10 foot stroke. The engine has a ballast-box capable of holding 60 tons, and to feed the boilers, 28 tons of coal are required daily. On the engine is the largest nut in the world. It is hexagonal in shape and weighs 1600 pounds. To tighten or loosen this nut, 20 men are required, while the wrench that fits it is 20 feet long. From the end of the walking-beam of the engine to the bottom of the shaft, the distance is 300 feet. The masonry on which the engine rests is 108 feet deep, some of the foundation stones weighing five tons. The engine operates four pumps, three of which are 30 inches in diameter and the fourth 22 inches. *Iron Trade Review.*

THE EXPORT AND THE CARRYING TRADES.—Unquestionably our export trade in machinery, implements, vehicles and hardware is increasing, but it is equally true that it is very much less than it would have been had our Government encouraged such trade as do the Governments of the manufacturing countries of Europe. The last official reports of exports and imports "show that during the fiscal year ending June 30, 1890, our foreign trade reached the highest figures in the history of the country, the enormous sum of \$1,649,192,014." Everything else has reached the highest figures also, and of the exports, a very large proportion was produced from the soil.

THE AMERICAN WOOD CARVING MACHINE, which is in reality an embossing machine—pressing any desired figure or form of wood engraving into a plain wood surface—has passed its experimental stage and is now in use with large and practical results. This machine produces perfect imitations of hand carvings in all designs, on any length, width and thickness of stock. It is simple in construction, occupies only 2x4 feet floor space, and is noiseless, automatic in action and free from dust or dirt. It cannot get out of order. It will perfectly finish from 1000 to 2000 lineal feet in ten hours, and from 1000 to 2000 pieces of paneling per day.

DRY LUBRICANTS.—The use of dry lubricants for bearings in places where oils and grease are objectionable, or where contact with fire may occur, is becoming better understood, and graphite in one form or another is now in general use. It has been employed on various kinds of machinery with uniform success. Mica also, in a dry, pulverized state, has given satisfactory results in many cases. Self-lubricating bearings, consisting of metal shells filled with compounds of graphite or mica, have also been operated with complete satisfaction.

EXPERIMENTS lately made on the strength of bent pipes have shown the strain on the inside of the angles, due to efforts of the pipes to straighten themselves under pressure. In one experiment where a copper pipe of 6 1/2 inch bore and three-sixteenths of an inch thick was employed, the angle was 90 degrees, and the legs 16 inches long from the center. At a pressure of 912 pounds to an inch, the deflection of the pipe was nearly three-eighths of an inch, showing an enormous strain on the inner side in addition to the pressure.

THE LARGEST PRODUCER of steel rails in the world is the Illinois Steel Company, which was formed about a year ago by the consolidation of four steel-rail mills. By reason of their ownership of ore mines and transportation lines on the lakes, and their nearness to the Western market, this company has been able to occupy a prominent position in the rail trade.

FORGED CAR-WHEELS are to be made by a new process by a Pittsburgh firm, according to press accounts. The wheels are to be forged from ingots of open-hearth steel. A series of dies under steam hammers will gradually develop the perfect wheel. The first experiments are reported as satisfactory and a plant for manufacture is promised at an early date.

MINING BY MACHINERY.—The old-fashioned way of mining coal with the pick and shovel is rapidly becoming a thing of the past. The mining machine is constantly making headway, and it will not be very long until it will have entirely superseded the old method.

ABOUT 1300 men find employment in the different mines and mills in Park City (Utah), and the average daily pay to each is \$3.25.

SCIENTIFIC PROGRESS.

A Substitute for the Potato.

Albert Meyer, a chemist, while in conversation, recently, with the editor of the St. Paul Globe, spoke quite enthusiastically of a new tuberiferous plant which he thought would do exceedingly well if introduced in the Northwestern States. He said:

A few years ago a scientist discovered in Japan a plant resembling the potato, and sent samples of it to Berlin and Paris to be experimented on. These experiments have been decided successes, and the new potato has been extensively introduced in Berlin and Paris, especially in hotels and restaurants. A number of farmers in our vicinity, with whom I conversed on the subject, are willing to experiment on the plant next season. The Royal Prussian Society of Berlin has taken pains to make experiments with the plant. The scientific name of this plant is *Stachys tuberifera*, but as to their form they might be called pine cones. *Stachys affinis* is another name, and lately they have given it the name *Stachys Sieboldii*. The cultivation is the same as the potato, and there have been found over 100 knolls in one hill; some as many as 300, but this is probably exaggerated. They are, of course, not as large as our common potato. According to the *Garden Flora*, the organ of the society, the analysis of the fruit is:

Water.....	78.33
Protein.....	1.50
Amide.....	1.67
Fat.....	0.18
Carb. hydrate (Principal galactan).....	16.57
Cellulose.....	0.73
Ashes.....	1.03

There is neither starch nor sugar, but galactan, a substance between both. *Stachys affinis* or tuberifera is an agreeable tasting vegetable when boiled in salt water and served with butter and parsley sauce. Some people like them sautéed in oil, but that is merely a matter of taste. Prepared like *pommes de terre frites* (potatoes cut in small slices and fried in butter), they are claimed to be a delicious dish. The taste is at first like that of a sweet potato, but one will soon feel a very fine piquant taste. They do not need to be peeled, but are only washed clean in water, which is another blessing to the housekeeper. They are kept in the ground as late as possible, and preserved packed in sand in the cellar during the winter months.

Exposed to the air, they will shrink and lose their nice, white mother-of-pearl-like color. The plant is winter-hardy, and thrives in any soil. Frost does not hurt them, and to have them always fresh, they are left in the ground and dug as wanted. In our climate it is best to keep them in a ditch or in sand in the cellar. W. Perring, Inspector of the Royal Botanical Garden in Berlin, informs me that the production is very large, and that there are many enthusiasts in favor of the new plant in that city, which prophesies for the plant a great future. The expectations of high prices and large yields will induce a good many farmers to make a trial with the new plant. I have already quite a number of orders for seed.

Personal Equations.

A Machine that Corrects Errors that Humanity Can't Help But Make.

The St. Paul Pioneer Press states that Carleton College Observatory has just secured a curious instrument invented by a scientist at Washington and called a "personal equation machine."

The object of the instrument is to harmonize the observations of different persons who are working together, at different times or at the same time. Astronomers well know that no two persons see exactly alike, by which is meant, for example, no two persons will say that a star passes a wire in a telescope at exactly the same instant. One will record its apparent passage slow on true time, while another will almost uniformly put its time fast. Observers unconsciously form a habit of seeing objects fast or slow on true time, and the better the observers are the more steady this error is as compared with true time. This error the astronomer calls the personal equation of the observer. In amount the personal equation varies from 0.02 of a second of time to something more than half a second for different observers, either fast or slow on true time. Such errors as these cannot be tolerated at all in astronomical observations for fundamental or original work of a nice kind, but must be in some way eliminated before final reduction can be attempted.

To accomplish this, in one way, an ingenious machine has been constructed which sets in motion an artificial star, quite like the appearance of a real star in the telescope. As this artificial star passes wires in the machine, the observer records his observations, and the instrument automatically records the exact time of the real passage of the star over the same wires. Now both records are made by the electric current, and consequently are perfectly true. These records are taken automatically in ink or by an instrument called a chronometer, and hence their differences can be measured with the utmost accuracy, and in this way the errors of the observer on true time are satisfactorily known.

The machine is in use every night that observers work either together or singly, so that

changes in individual personal equations may be detected, as well as the differences that may exist between observers. The instrument, therefore, furnishes an unvarying standard for accurate observation.

AN INTERESTING DISCOVERY.—Many things have been discovered which tend to show the existence at some period of the world's history of a race of men possessed of a knowledge and executive ability equal to that claimed by the most advanced of our nineteenth-century civilization. One of the latest of these is that made in an Illinois township recently, which goes to show that the aborigines, or a race of men that inhabited this continent before its discovery by Columbus, were well up in the industrial arts and acquainted with the natural resources of the country. The report says that the discovery was made in Jackson county of an old smelting furnace, supposed to have been used by some race of people that once inhabited this country long before its discovery by the white man. It is located in the west part of the county, and was discovered by a mere accident. Several of these old furnaces have been discovered in the vicinity, and they are a great curiosity. This particular one is built in a ravine, and it inclines upward as its mouth leaves the almost abrupt sides of the ravine, and continues in this direction for some 20 feet, then declines until it empties into the opposite side of the ridge, with a charger built of antique marble. Further search has brought to light other evidences of this industrious people, such as pieces of iron and lead ore, sink-holes, slag-piles, etc.; in fact there is every evidence that at this place there once existed a prosperous and thrifty mining camp. Great interest is manifested in the discoveries, and other developments are expected which will reveal new and valuable information.

THE PATH OF STORMS.—A method is now on trial at the meteorological office at Stockholm which seems likely to throw some light on a subject which hitherto has been attended with much uncertainty, namely, the determination of the path taken by storms. From the telegraphic weather reports, tables of the density of the atmosphere have been constructed, and other data have been collected which have been embodied in special charts. These charts are found to give a more reliable clew to the movements and origin of cyclones than the usual method of the comparison of the isobars and isotherms alone. The latest investigations show that storms move in the direction of the warmest and dampest air, parallel to the lines of equal density, leaving the rarer air to the right hand. M. Faye, member of the French Academy of Science, thinks that it is feasible to predict storms twelve hours in advance of their coming by the sounds which the changing atmospheric conditions produce and which the telephone will transmit.

TANNING BY ELECTRICITY.—M. Munz, professor at the Institute Agronomique, has published a favorable report on the Worms and Bile process of tanning by electricity. All the hides so tanned had, says M. Munz, the appearance of hides tanned by the ordinary process. Tests with acetic acid showed that the hides were thoroughly well tanned after a maximum of four days in the vats. Further chemical tests showed that the tannin was as well combined with the leather as in the ordinary method. We may mention in this connection that a large firm of tanners in Paris is sending out with every consignment of hides a certain proportion of electrically tanned ones, intimating that any of the electrically-tanned skins which are not found up to the mark will be immediately exchanged for some tanned by the ordinary process. No electrically-tanned skins have as yet been returned.

A CIRCULAR RAINBOW.—A correspondent of the London Times says that on Sept. 30th he and his party saw a rainbow which formed a complete circle, visible for nearly half an hour during their ascent of the Finsteraarhorn. "There were," he says, "heavy clouds lying some 4000 feet below, on the Aar glaciers, and it was on these that the beautiful, brilliantly colored ring lay. A secondary circle was also visible. We were near the summit of the peak when we first observed it, and from that point the face of the mountain on the Grimsel alpe is almost perpendicular."

NATURAL COKE.—The Seattle (Washington) Press in its notes from Alaska says that a remarkable discovery has recently been made near Unalakleet—a coal transformed into coke solely by the forces of nature. The locality has been taken up by the steamship company. So positively assured is the company of the extent of the deposit that it has undertaken to supply the local demand, in addition to furnishing during future seasons fuel, not only for its own steamers, but also for those in the Government service.

MADAGASCAR MINES.—A complete plant of hydraulic mining machinery is being made by Raoul Charley of the City Iron Works, this city, for shipment to Madagascar. A gentleman from that distant country came here and visited Nevada and Placer counties to investigate the methods of placer, drift and quartz mining. The plant ordered here will be shipped shortly to Mevatan, Madagascar, and competent men to operate it will go from here at the same time.

USEFUL INFORMATION.

PITTING AND WRINKLING OF VARNISH.—Varnish is very liable to pit if sugar of lead has been used as a drier; also when it has not been given time to ripen, which should not be less than four months. A painter, finding his varnish will not flow freely, is sometimes tempted to mix with it some other kind of varnish, in which case, looking at the sensitiveness of varnish to exterior influences, it is not surprising that pitting should ensue. Varnish at the bottom of a barrel very frequently contains sediment, and if this lower portion is used when the varnish has stood long, one must not be surprised at pitting. A damp floor in summer weather will at times occasion pitting, owing to the exhalation of the moisture; also a sudden chill. Wrinkling is almost an infallible result when varnish retains its humidity too long. If applied too thickly, certain portions of the surface are apt to overflow, hence wrinkling. Toughness is a good quality in itself, but accompanied by slow drying, wrinkling is apt to present itself; therefore it must be seen that the varnish has the requisite staying qualities.—*Painters' Magazine.*

AN IMPORTANT MARINE INVENTION.—A new sounding apparatus has been invented in England for which several advantages are claimed. The machine is intended to serve not only as a reliable means of sounding, but also as a submarine sentry, giving warning when any particular depth of water is reached. The apparatus comprises a winch with indicators, etc., and a wooden skinker, the latter being the essence of the invention. Practically, this skinker is a wooden kite reversed, and is so adjusted in weight and shape that it sinks when towed through water, and always remains at any given depth without any regard to the change of speed of the ship. The depth being arranged at that which will be perfectly safe, whenever bottom is reached at that depth the machine may be so arranged as to automatically sound a steam whistle or bell or give notice to the pilot in some other way that the ship is approaching dangerous water. The invention, it is said, has been subjected to prolonged tests and proven to be perfectly practical and reliable.

RAILWAY BRAKE SHOES of compressed leather is the novel proposal of a company in New South Wales. Waste leather scraps are steeped in a solution and subjected to hydraulic pressure to mold them into any desired shape. A report of Mr. D. H. Neale, Government Engineer of Railways, describes comparative tests of leather brake shoes with iron. The leather shoes weigh $4\frac{1}{2}$ lbs. against $21\frac{1}{2}$ lbs. for iron, and wear three times as long. The coefficient of friction is said to be considerably greater, so that 40 lbs. air pressure is as effective as 70 lbs. with iron brake shoes. If a practical brake shoe of leather or fiber were put on the market, its use ought to be made obligatory on elevated railways at least to stop the dangerous shower of iron particles, which injures so many eyes. Compressed paper has been talked of for this purpose, but has not succeeded in establishing itself in general use.

A DEVICE to catch those who are compelled to jump from windows at fires has been invented by Alfred Horley of Albany, N. Y. It consists of a large cushion provided with springs of long-range action, which save the unfortunate from injury by the rebound. This is mounted on a convenient running gear. The cushion can descend nearly three feet, and to prevent injuries from the rebound, air-cushions are applied as in door checks, which bring it gradually to a state of rest. This seems a most decided improvement over the old-fashioned net.

HOW GLASS CLOTH IS MADE.—The thread is drawn out of a molten bar of glass, by means of a rapidly revolving wheel, at the rate of 200 yards a minute; the weaving is done by looms as with silk. The coloring is applied with minerals, while the glass is in a state of fusion, before spinning, and the most beautiful shades are easily produced. The chief difficulty in the manufacture of glass cloth seems to be in the manipulation of the threads, which are so fine that a bunch containing 250 is not so thick as an average knitting-needle.

CHINESE TALLOW OR TALC, so abundant in Leadville mines, is said to be self-lubricating, and possesses many other advantages adapting it to that purpose. A prominent railroad man offers \$20 a ton for all the talc that can be produced. Should the experiments already made be corroborated by extended tests, an important addition to the mining resources of Colorado is assured, as talc is abundant not only in Leadville but throughout the State.

THE BESSEMER INVENTION.—The best idea of the value of the Bessemer invention may be formed from the simple fact when Bessemer began experimenting, steel sold in England at from \$250 to \$300 a gross ton. He soon made a better steel at a cost of \$30 a ton.

COOKING UTENSILS of all kinds are now made of wrought steel. These utensils thus made are of excellent quality, fine steel and good finish, and are practically unbreakable—that is, when used with reasonable care. They do not absorb

grease or retain the flavor of food previously cooked, and may be constantly kept at a fine polish.

ELECTRICITY.

ELECTRIC CANAL PROPULSION will yet become almost or quite universal. The following from *Engineering* refers to canal propulsion by means of storage batteries operating upon ordinary propellers. A more ready and convenient way would seem to be the employment of the trolley system, as the wires could be readily placed overhead and need never be in the way of traffic. The *Engineer* says: Propulsion by electricity is effectually demonstrated at the Edinburgh Exhibition. The site is skirted by the Union Canal, and four launches are running on the canal. The dimensions are, 40 feet long, 6 feet 6 inches beam, and the draught of water is 2 feet 1 inch. They each carry 40 passengers. The electrical equipment is similar to that used on the Thames launches. The charging plant consists of a 25-horse power engine and an Immisch dynamo, and the switch arrangement is suitable for charging all the four launches at the same time. The recharging is done during the night and the launch can run from 10 to 12 hours. The motors are capable of an output of about $3\frac{1}{2}$ brake horse-power, working up to 800 revolutions per minute, and the speed with the maximum load on board is six miles an hour. The propellers are coupled direct to the motor shafts. A hall-bearing thrust block is attached to the motor's bed and is constructed in combination with the plain bearing of the motor. This is the invention of the Messrs. Immisch, and has been patented by them. The steering, starting, and reversing gear is so arranged that one man has the launch entirely under control. These, so far as we can learn, are the first electric launches which have been worked commercially in Scotland.

TINTING INCANDESCENT LAMP BULBS.—The incandescent electric light may be greatly improved and made much more effective by giving the bulbs a tint of some kind. This can be quite readily done in the following manner: Prepare the glass by thoroughly washing in soap and water and drying. Then dip in bath (made by beating up the whites of two eggs in $1\frac{1}{2}$ pints of water, and filtering) and hang up to dry. Dissolve the aniline color in photographer's common collodion. Red or blue aniline will form clear solutions, while the green solution will require filtering. Yellow aniline forms a handsome color, but the surface of the glass presents a frosted appearance after the application. Violet and purple colors may be obtained by combining red and blue in different quantities. When the solution is ready, dip the prepared glass bulbs therein, hang up to dry, and finally pass a current to the bulb for half an hour, that the heat thus generated may harden the collodion. The preparation can easily be removed by alcohol or sulphuric ether, but is not effected by water. Experience has shown that the best results are obtained by not using too much aniline. Make the color light rather than deep, and apply two or three coats.

LOW PRICES OF ELECTRICAL APPARATUS.—The Edison Electrical Company, in order to induce a more general introduction of electrical appliances into the industries of the country, has given notice of a general reduction in price of electrical apparatus by a very large percentage—in some cases fully 50 per cent. There has no doubt been a very large profit in such manufacture heretofore. During the time in which the Brush Electrical Company practically controlled such manufacture, it is said the profits of the company were fully 300 per cent on its dynamo and most of its other manufactures. Competition has since greatly reduced such profits, and the Edison Company has been the chief factor in such reduction. That company has now taken another long step in the same direction, and all other companies must follow suit or lose business. The electrical industry has become one of the leading ones of the day, and any material reduction will undoubtedly give it a greatly increased rapidity of growth. Of course electric lighting and power will be included in the reduction.

ELECTRIC RAILWAYS IN THE VICINITY OF BOSTON.—There is quite a spirited movement afoot for the construction of an electric street railway between Framingham, Mass., Wellesley, and Natick, and it is more than likely such a road will be built ere long. The storage battery cars on the Beverly & Danvers street railway are so great a success that the company is seeking authority to run over more territory.

TELEGRAPH LINES are subject to a great variety of pests. In Rio, for example, there is an orchid that incrusts the wire and causes leakage. In Japan, the large web of a spider, dripping with rain or dew, frequently interrupts the traffic; while in Norway a large species of woodpecker raises havoc with the poles.

LIVERPOOL is building its first overhead electric railway. The line will be $5\frac{1}{2}$ miles long when completed and the columns have been erected for over one mile. The line will be worked by electric locomotives.—*London Electrical Engineer.*

GOOD HEALTH.

Prevention of Consumption.

The health department of the city of Providence has issued the following circular:

Consumption causes more deaths than any other disease the human race is subject to. Nevertheless it is to a very large extent preventable. It is, though not generally known, a contagious disease. Consumption, or pulmonary tuberculosis, is in every case caused by disease germs which grow in the lungs in enormous numbers. When a person is sick with this disease, these germs are coughed up in great quantities in the expectoration, and when this becomes dry and crumbly, or is trodden to dust, the germs float about in the air and are liable to be breathed into the lungs of any one. If the lungs of the person who does breathe them are poorly developed, or if the constitution is feeble, the germs are very sure to grow and cause the disease. Unfortunately, we do not know how to kill them when they are once in the air-passages. The best that can be done is to build up the system and strengthen the lungs by the use of cod liver oil, good food, and fresh air.

Much, moreover, can be done to prevent the spread of the disease by destroying the germs as completely as possible in every case.

(1) No person with consumption should ever spit on the floor or in the street. If handkerchiefs or bits of cloth are employed, they should at once be disinfected or burned. A good plan is to use a small wide-mouthed bottle with a rubber stopper. The contents should be thrown into the fire and the bottle and stopper thoroughly soaked with boiling hot water every day.

(2) The dishes used by a consumptive should be at once disinfected, and the unwashed underwear and bed-clothing should be thoroughly boiled as soon as possible.

(3) When a person with consumption has diarrhea, the discharges from the bowels should be at once disinfected, as at this time they contain the disease germs. A good way is to add a half-teaspoonful of fresh chloride of lime, or fill up the chamber vessel with boiling water.

(4) No one with consumption should sleep in the same room with another person, and the room occupied by a consumptive should be thoroughly cleansed as often as possible.

(5) No mother with consumption should nurse an infant, and children ought never to be taken care of by a consumptive person.—*Boston M. and S. Journal.*

BRAIN WORKERS AND ATHLETICS.—Life is puzzled over the career of the late Cardinal Newman and John Boyle O'Reilly. The former was a frail, slight man of infirm constitution, but despite this he lived to a very advanced age; the latter was a man of pleuritic physique, who kept his system in training by physical exercise, athletic sports, and followed all the suggestions of modern physical culture. Yet he died in the prime of life. Shall we not, then, live quiet, ascetic lives, ignoring the body and cultivating the spirit? Or shall we cultivate both body and mind? The latter course is the one so much commended to-day; yet it is not a sure passport to longevity, as many cases prove. In fact, the brain-worker is better if he lives a regular, temperate life, and pays no attention to the development of his muscles. A little walk, some fresh air, and sound sleep are all he needs. Some people, to be sure, can be athletes and do brainwork also, but it is not the rule. A sound mind should have a sound body, but it does not need herculean muscles. The best athletic work is done by growing boys and adolescents, who have an extra supply of vitality. When they have matured, and undertaken the responsible work of life, they speedily drop out of the championship; and the lesson we would draw from the opposite cases brought up by Life is that athletics are not needed by brainworkers, and will, if carried to excess, shorten life rather than lengthen it.—*Medical Record.*

TO TELL THE APPROACH OF DEATH.—Dr. Chiappoli states that he has frequently noticed in patients, apparently very far from death, an extraordinary opening of the eyelids, so much so as to give the eyes the appearance of protruding from their orbits, which he considers an invariable sign that death will occur within 24 hours. In some cases, when only one eye is wide open while the other remains normal, death will not follow quite so rapidly, but will take place inside of 72 hours, there not being the slightest chance for recovery after these symptoms set in, however remote final dissolution may seem to be. Chiappoli says he is utterly at a loss for an explanation of this death symptom, but ascribes it to a diseased state of the sympathetic nerve.

NUTRITIVE PROPERTIES OF CREAM.—The fact is not so well known as it deserves to be that cream constitutes an admirable nutriment for invalids. It is superior to butter, containing more volatile oils. Persons predisposed to consumption, aged persons, or those inclined to cold extremities and feeble digestion, are especially benefited by a liberal use of sweet cream. It is far better than cod-liver oil, and besides being excellent for medical properties, it is a highly nutritious food.

ENGINEERING NOTES.

A New System of Tunneling.

Those who are familiar with tunneling operations and subway and sewer construction in towns are well aware of the importance of preventing subsidence of the surface after the completion of the work. The most frequent cause of subsidence is that, to admit of the usual system of timbering, ground beyond the limits of the permanent brickwork is disturbed or removed. As it is seldom replaced by packing as solid as the original ground, settlement ensues sooner or later. A new method of tunneling has been invented by Messrs. Jennings & Stannard, 94 Victoria street, Westminster, London, which obviates this fruitful source of trouble and expense, as by its use no ground outside the actual section of the subway need be disturbed. The system in question comprises a series of steel bars, which are placed side by side within the excavation, so as to form a complete temporary lining and support to the roof. Within this series of bars the permanent brick arch of the tunnel is built. The system has been adopted in the construction of the new relief tunnel of the Great Northern Railway at King's Cross.

The bars used in this work are 10 feet long, 6 inches wide, and 2 inches thick, and are provided at their edges with longitudinal grooves, by means of which each is linked to the next one in such a way as to admit of separate longitudinal motion, and yet to prevent lateral separation. The bars are inserted and supported in the same manner as ordinary tunnel bars, the ground being excavated only the exact section of the tunnel, plus the trifling thickness of the bars. After the brickwork has been built within them, the bars are separately pushed forward by screw jacks, as the ground is excavated for the succeeding length. The bars are provided with longitudinal tubular cavities, through which grouting or other filling material may be introduced from time to time, to fill the space left vacant by the advancing bars between the top of the lining arch and the earth above and around, and this prevents any subsidence.

With regard to economy, it is said that at the King's Cross tunnel, experience has shown that, besides a great saving of time, there has been a reduction, as compared with the ordinary method, of about 50 per cent in the cost of all the work effected by the new method. The invention will unquestionably facilitate the construction of tunnels, subways, and sewers, in cases where it is necessary to support the superincumbent earth and to prevent subsequent subsidence of the surface. The system marks a solid advance in the construction of tunnels, and reflects credit on its inventors.

Wind vs. Steam.

In current calculation as to the cheapening of power wherewith to turn the armatures of dynamos for the generation of electricity, the utilization of the power of the air in motion is ignored. Some years ago Sir William Thompson, the great English electrician, predicted that windmills would be used ultimately for charging storage batteries, and that power has been utilized thus in some localities. The multitude of windmills used for pumping water is enormous. The windmill can be used with equal success for operating light dynamos and charging the cells of storage batteries.

Wind, of course, is an intermittent power. Its force is calculated for an average duration of eight hours out of 24. In the Northwest the average would be much longer than that, as there are very few calm days in the year. The windmill of the present day is a very superior affair to the old canvas sail. It is light, strong and automatic, answering the varying direction of the wind. It is made of wooden slats, and the rudder keeps the disc to the wind. After the disc is set up, the only expense is oiling and occasional repairs. The expense, in fact, is a mere bagatelle to steam-power.

Wind-power is the cheapest on earth. It can be used in many cities with ease to charge all the batteries necessary to light every house in the place, and furnish power where needed. The subject is worthy of public attention. With the growth of the use of accumulators, the wind-power must come in as the chief agent for charging the cells. Its convenience and cheapness recommends it. Nobody can monopolize the wind. It is free to all.

UTILIZE THE BROOKS.—Says the *American Contract Journal*: In the rivers rolling to the sea are millions of horse-power daily running to waste. We do not appreciate the brook and river because they are so near and have been there so long. Had they commenced flowing but to-day, we would have hastened to harness them.

A FRENCH ENGINEER proposes to pen up the tide-water at Havre, and, by running turbines from this 16-foot rise and fall of the water level, to create and transmit to Paris 42,000 electrical horse-power. The Bay of Fundy may yet be harnessed down to the factories of New England.

PUMPING NATURAL GAS WELLS.—Successful experiments have been made in pumping natural gas wells to increase the flow.

TABLE OF CONTENTS.

EDITORIALS.—San Bernardino County Silver Mines; Geological Map; Report of the Debris Commission, 17. Passing Events; The Apex Law and the Square Location; The Wet and Dry Seasons of California; The Utica Mine Accident; Patents, 24. Terraced Overflow Basins; The Knowledge Water-Works Pumping Engine; The California Academy of Sciences, 25.

ILLUSTRATIONS.—The Runover Mill, Calico Mining District; The Waterloo Mills of the Oro Grande Mining Co., 17. Our State Flower—the California Poppy, 19. Knowledge Compound Duplex Pumping Engine; Terraced Basins of Blue Springs, Mammoth Hot Springs, 25.

MISCELLANEOUS.—San Bernardino County; A New Mining District; Hunting for Coal; Mapping the Death Valley Region; For Reducing Ore; To Dig for Petroleum; Iron Molders' Union, 18. Wild Flowers; Our State Flower, 19.

MECHANICAL PROGRESS.—A New Metallurgical Process; A New Electric Welding Machine; Increasing Uses of Aluminium; Largest Stationary Engine; The Export and Carrying Trades; The American Wood Carving Machine; Dry Lubricants; Mining Machinery; Miscellaneous, 22.

SCIENTIFIC PROGRESS.—A Substitute for the Potato; Personal Equations; An Interesting Discovery; The Path of Storms; Tapping by Electricity; A Circular Rainbow; Natural Coker, Madagascar Mines, 22.

USEFUL INFORMATION.—Pitting and Wrinkling of Varnish; An Important Marine Invention; Railway Brak-Shoes; How Oases Cloth is Made; Chinese Tallow; The Bessemer Invention; Miscellaneous, 23.

ELECTRICITY.—Electric Canal Propulsion; Tinting Incandescent Lamp Bulbs; Low Prices of Electrical Apparatus; Electric Railways in the Vicinity of Boston; Miscellaneous, 23.

GOOD HEALTH.—Prevention of Consumption; Brain Workers and Athletics; To Tell the Approach of Death; Nutritive Properties of Cream, 24.

ENGINEERING NOTES.—A New System of Tunneling; Wind vs. Steam; Miscellaneous, 23.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 20-21.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, etc., 28.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 28.

Passing Events.

The Legislature has convened at Sacramento, and, having pretty well finished with its appointments to office, will soon be at work on bills. Already a number have been introduced and many more are to follow. We shall, as usual, have something to say concerning those measures which interest our special class of readers.

The trouble with the Sioux Indians still continues, and as we write (Thursday) it is believed a battle is in progress.

The U. S. Senate is still considering the free coinage of silver, but little progress is made. It is unfortunate that silver should be mixed up in political questions as it seems to be, for the subject is not dissonant as to its merits as would otherwise be the case.

The U. S. Debris Commissioners, who have been investigating the question of the mining debris with its relation to the navigable rivers of the State, have completed their report and will forward it to the War Department this month.

The Utica mine, at Angels, Calaveras county, seems unfortunate in the matter of accidents. Last year 13 men were killed by a cave in the mine, and on Monday of this week 10 men were killed by the breaking of the wire cable attached to the cage.

MINING improvements in Pima county, Arizona, were never progressing more rapidly or more favorably than at present.

The Apex Law and the Square Location.

Next to the determination and settlement of land titles, the ownership of mining claims has been in California the most fruitful source of litigation, the greater portion of this litigation having grown out of the question of side lines or its equivalent. So generally has this been the case that a very radical change in the statute governing in this respect would seem to be demanded. Under the law as it now stands the claim owner may follow and work any lode having its apex or croppings within his surface lines even though it extend in its downward course outside those lines. There has come to be developed a strong public sentiment in favor of substituting for this law one providing for square locations, and confining the rights of claim owners within their surface boundaries.

In other words, it is proposed to make our mining laws conform in this respect with those of all other civilized nations, bringing them at the same time into harmony with our practice as regards placer, coal, stone, agricultural and all other land claims, the owners of which have no right to go outside their surface lines. Within these lines they may go downward without limit, but laterally not a hair's breadth over them. With a law like this the doubt and obscurity that now invests this species of property would disappear, and all would be rendered plain, fixed and certain. Instead of having recourse to legal proceedings, involving a necessity for lawyers, helliffs, courts and juries to settle disputes about ore bodies, the services of an expert surveyor would suffice to determine a question of this kind at little cost and in a very short time.

It might be thought that a law enacted so many years ago, and which has since been the subject of so much adjudication, would by this time have become so well understood that its workings could give rise to but little controversy. But this is a misapprehension. It has been, as already remarked, a prolific source of litigation. Scores of suits have grown out of it, and they continue to multiply year by year. The court calendars are crowded with them, and not always have the findings of the various courts been in harmony. The opinions of the several judges have sometimes been in conflict, leaving the law in such particular cases unsettled and doubtful. Even in the Supreme Court of the United States, a minority have at times dissented from the findings of their brethren on the bench. And so this very uncertain law has on occasion been rendered still more uncertain by the acts of its ablest interpreters.

If the judiciary, perplexed and in doubt, has called to its aid the learned geologist, the mining expert and others skilled in rock formations, vein systems, dips, faults, dips, spurs and angles, these specialists have not infrequently been found so divided in opinion that the judicial mind has, through these helps, been only the more bewildered where it sought for guidance, and the judicial vision only the more obscured where it sought for enlightenment. The truth of this statement is well exemplified in the manner in which we find these authorities arrayed against each other in the suit now on trial in Los Angeles, and to which some allusion was made in these columns last week.

Here we have six professionals, all honest, capable and experienced, pitted against each other, three on a side, their testimony being, presumably, entitled to equal weight. What is the court and the jury to do in a case of this kind? Of course find for the side on which there seems a preponderance of evidence, which is hardly more than making an intelligent guess or striking in the dark.

Now, clearly, much of this obscurity, perplexity and doubt would be obviated were the plan of making square locations and restricting all within their surface limits adopted in place of the present apex theory, which in all these legal contests constitutes the principal element of uncertainty. To continue this apex clause in the law governing mining locations will be but to perpetuate these costly feuds and hequeath to coming generations a heritage of enmity and strife.

THE recommendations of the International American Conference for the establishment of an American Monetary Union, and the issue of a common silver coin, have been adopted by all the American Republics except Guatemala, Uruguay and Paraguay, which have not yet been heard from.

The Wet and Dry Seasons of California.

For half of the year or more, the people of California are apt to pay little attention to the subject of meteorology. They meet and salute each other without making, as at other times, any allusion to the condition or prospects of the weather. The period during which the weather causes such little concernment covers what is here known as the dry season of the year, extending usually from about the middle of April to the middle of November, during which the rainfall hardly ever exceeds an inch or two, it sometimes amounting to less than a single inch.

But if, during these seven months, we so dismiss this weather topic wholly from our thoughts, it does none the less occupy them largely for the other five months of the year, which we designate the wet season. Any rain falling here between the end of May and the middle of October is generally deprecated, as causing more harm than good. On the other hand, any great delay in the commencement of the wet season, or the occurrence of a protracted drought after its advent, is here equally to be dreaded, because of its injurious effects on most of our leading industries. Such condition hurts alike the business of mining and of farming, owing to the water supply being insufficient for their successful prosecution.

But while so much mischief inevitably comes of a winter drought, any great superabundance of rain works at this season equal harm, the flooded rivers sweeping away the miner's mills, dams, ditches and other plant, and so saturating the ground with moisture that plowing and seeding are delayed and the growing crops more or less damaged, they being sometimes wholly drowned out.

And thus the winter or wet term becomes in California a season of constant anxiety and conjecture, every class thinking and talking about it, because all are interested in the way it shapes. About mid-autumn it is the wont of the weather-wise among us to begin speculating as to the probable character of the coming winter, these speculations being based on a variety of facts or supposed facts, such as the movements of the wild fowl and other migratory birds, the habit of the woodpecker and the ground hog, the flow of the springs, etc.

Strangely enough, these weather prophets never agree in their conclusions. Professing to be guided by the same signs, they either see these differently or put upon them a different construction, about one-half of them every year prognosticating a wet and the other half a dry season. Going back only a few weeks, we find these people thus divided in opinion, one set telling a wet and the other a dry winter, neither of which predictions has thus far come to pass, the weather having been marked by neither extreme. Up till this time the winter has in fact been an exceptionally favorable one. We have everywhere had enough rain and nowhere too much. The meteorological conditions could hardly have suited us better had they been prepared to order. Though a little tardy, the rains, since they commenced, have been well timed and plentiful, the grass and early-planted grain having been started into vigorous life, while plowing followed by extensive sowing has everywhere been made possible. The flow of the rivers has been so increased as to improve navigation and afford the miners an abundant supply of water, the rise in the mountain streams having at the same time been so slight as to greatly prolong the working season of the river-bed miners.

But while the present has so far been a model winter, being as yet not half over, there remains, of course, a chance that a damaging drought or a damaging flood may occur before it is ended. As far as it has gone, it tends to discredit the vaticinations of these weather oracles and to such extent impair confidence in their ability to divine the future conditions and movements of the meteorological elements. There seems, in truth, to be no infallible or even tolerably safe rule whereby these things can be foretold.

As regards our summers, it is otherwise. It takes not much of a prophet to foresee what will be the general character of one of these. The wet season over, we have for the next six months little need for the signal service or the part of the almanac that speaks of meteorological changes. The rubber coat and the gum

hoot are now relegated to the lumber-room. The umbrella, the possession of which could herefore be maintained only by the greatest vigilance, may now be safely left in any exposed place, no other article being so little coveted because no other is so little needed. The street-sprinkler must now work without intermission; not here, as in most other countries, may he remain half the time idle. We dry our green fruits largely in the sun and make salt in the open air, and not, as elsewhere, in vats protected by sliding roofs that may easily be run over when the rain comes on. The farmer stacks his soaked grain in the field and there leaves it till he cares to haul it away or the near approach of the rainy season makes this necessary.

The foregoing, while they include some of the more notable, comprise but a small part of the benefits incident to the calm, rainless summers of California; nor are our mild and open winters without their advantages; outdoor work during this season goes on with little interruption. Planting, plowing and seeding are everywhere successfully prosecuted, mining and lumbering, except in the higher mountains, receive no check, this being, in fact, with most of our leading industries the most busy season of the year.

Patents.

In the year 1890, the U. S. Patent Office issued 26,292 patents, being over 2000 more than any previous year in the history of the office. The total number of patents issued to January 1, 1891, aggregates 443,986; designs, 20,438; reissues, 11,136; trademarks registered, 18,774; labels, 6402.

It will doubtless be a surprise to many to learn that, notwithstanding the great number of patents already issued, the annual number is on the increase, and was last year greater than ever before. But there is good reason for this. The great multiplication of mechanical appliances in all the various branches of human industry calls for improvement in methods and in details, and inventors are kept busy in all directions. There are also many new branches, such, for instance, as electrical appliances, which offer fine fields for the inventor.

It is, moreover, now a well-recognized fact that no improvement is too small or unimportant to cover by patent. Every improvement simplifying or increasing the efficiency of any mechanical appliance adds so much to its value. Therefore the men who improve any well-known and commonly-used article may reap as much reward as the person who devises an entirely new thing, which must yet be introduced into public use.

The Pacific Coast is not behind the rest of the country, in proportion to its inhabitants, in the matter of inventions. In the last year 817 patents were issued to inventors in California, Oregon, Washington, Nevada, and Arizona. This is an evidence of our industrial progress and inventive talent. The majority of these Pacific Coast patents were obtained through the MINING AND SCIENTIFIC PRESS Patent Agency and very many of them are of considerable value and importance.

The Utica Mine Accident.

On Monday of this week, while ten men were on the skip of the Utica mine, Angels, Calaveras Co., the hoisting rope broke, dropping them 450 feet to the bottom of the shaft, killing them all. The cable has only been in use three months, is of steel, 1½ inches in diameter, and should carry many more tons than were on the cage. It is said there was a jar or shock before the rope broke, as if a steel bar or other implement had caught in the timbers.

No details of the accident have been received as yet, so the reason why the safety clutch did not catch is not explained. It is assumed, of course, that such mining men as Hayward & Hobart, the owners of the mine, would not allow the cage to be operated without a safety appliance. However this may be, the cage dropped to the bottom of the shaft, when the rope broke, and all the men in the cage were killed.

It was in this same mine that a number of men were killed by a cave in December, 1889. It had rained steadily for some weeks previous to the accident and a number of men were sent down to repair the timbers, when without any warning the earth crushed in on them and killed them all. Four of the bodies were recovered only three weeks ago, and four are still in the debris of the shaft.

Terraced Overflow Basins.

Among the many interesting natural phenomena that claim the attention of the visitor to the Yellowstone National Park, the geysers and hot springs rank first in general interest. Their novelty and beauty attract universal admiration, while the vast quantities of hot water that flow from the ground are convincing evidences of the nearness of internal heat. These steaming fountains and boiling pools are usually surrounded by snowy white borders of mineral matter deposited by the hot waters.

At the Mammoth Hot Springs this consists of carbonate of lime that forms the fretted rims of the pools and the beautifully beaded and coral-like deposits of the cones, and covers large areas of ground about the springs with a sheet of white and glaring slt. Not only are the occurrence and the nature of these deposits such as make them of interest to every visitor, but the problem of their origin has proved to be one of the prominent features in the scientific investigation of the hydrothermal phenomena of the park, as it has been found that such deposits are very largely due to the growth and life of a brilliant colored alga vegetation, living in the hot waters.

Although the Yellowstone Park abounds in hot springs, calcareous hot waters are extremely rare and but one locality is known where such springs have formed deposits of travertine or calcareous tufa to any considerable extent. This is the Mammoth Hot Springs. At this place the heated waters rising through mesozoic limestone reach the surface heavily charged with carbonate of lime in solution, which is deposited by the hot waters in the form of travertine, affording an excellent opportunity for a study of the formation of this mineral. There are few places in the world where such deposits equal those of the Mammoth Hot

usually irregular, wavy and scalloped. The water runs over the rims in thin sheets and little cascades, depositing travertine wherever it flows and constantly building up the basins until the flow is checked by the increased height of the rim. Yellow sulphur-coated algae threads are abundant on the bowl of the spring and the rapid-flowing streams, but the exquisite blues and greens of the hottest basins

KNOWLES' COMPOUND DUPLEX PUMPING ENGINE.

are due solely to the depths of water. The bright lemon, red and green shades of the cooler pools are, however, entirely vegetable in their nature, and due to the presence of algae lining the basins and stripping their outer walls. In a general view of the entire collection of these basins, obtained from the edge of the terrace above, the effect is that of a brilliant mosaic, the colors occurring in well-defined areas outlined by the travertine rims. Looking at the pools nearer by proves that these colors are not

The Knowles Water-Works Pumping Engine.

The accompanying illustration represents one of the latest and most improved compound condensing duplex water-works pumping engines made by the Knowles Steam Pump Works. Parke & Lacy Co. of this city has just sold one of these pumps to Mr. H. Bloomfield,

engineer of this city, for the water works at Lewiston, Idaho, the dimensions of which are as follows: Two 12" diam. H. P. steam cylinders; two 22" diam. H. P. steam cylinders; two 12" diam. water plungers; all 18" stroke.

The water ends are made in two independent castings, from very best charcoal iron, and are fitted with hand-hole plates for easy access to both suction and delivery valves.

The delivery from each water cylinder is through an elbow into a "Y," and on top of

conducting material, over which is placed a handsome black-walnut lagging fastened with brass bands. The piston rods in the steam ends are of steel, one rod for each high-pressure steam piston, and two rods for each low-pressure piston, passing through barrels cast on the outside of high steam cylinders, all three rods taking hold on a common cross-head with the piston rod from the water end, thus bringing the stuffing-boxes all out in front of the lagging where they are in sight at all times and can be easily packed without removing lagging, etc.

The steam end and water end are connected by eight heavy, wrought-iron, polished tie-rods. The valve motion is very heavy and strong, consisting of two wrought-iron rock shafts working in adjustable babbitted boxes, wrought-iron rocker arms and connections all made with adjustments for taking up lost motion.

Each high-pressure steam chest is fitted with a throttle valve and these two throttles are connected to a "Y" to which is fitted a main throttle valve.

This pumping engine is fitted with the latest and most improved independent air pumps and jet condensers, the air pump having 7" steam cylinders, 10" vacuum cylinder, 10" stroke. The air cylinder is lined with a heavy composition bushing; the air piston is of composition fitted with adjustable fibrous packing; the piston rod of composition; the valve plate of composition, and the valves of rubber, fitted with brass bolts and springs. The condenser is of the latest improved cone pattern, fitted with vacuum gages, etc.

In the exhaust-pipe from the low-pressure steam cylinders to the air pump is placed one of the latest improved feed-water heaters, which is lagged with black walnut fastened with brass bands to correspond with the lagging on the main engine. The feed-pump takes its supply from the air-pump discharge, and forces the water through the heater, furnishing hot feed-water to the boilers.

The duty of the plant is 50 to 60 million foot pounds and its daily work consists of pumping 1,500,000 gallons with a head equal to 240 feet, including the suction and friction of the water pipe. This pumping engine throughout is handsomely finished and in keeping with the high class of machinery always furnished by the Parke & Lacy Co.

Academy of Sciences.

The California Academy of Sciences held its annual meeting last Monday in the new building on Market street. Dr. H. W. Harkness presided. Reports were received from the Board of Trustees. The treasurer reported disbursements for the year amounting to \$182,669 22; cash on hand, \$1231.02. The librarian reported 2694 books received during the past year. Reports were also received from the Curators of Ornithology and Ichthyology. The president made a brief summary of what the society had accomplished during the year.

The Committee on Elections reported the following officers elected to serve for the ensuing year: President, H. W. Harkness; first vice-president, H. H. Behr; second vice-president, George Hewaton; corresponding secretary, Frederik Gutzkow; recording secretary, J. R. Sonham; treasurer, L. H. Foote; librarian, Carlos Troyer; director of museum, J. G. Cooper; trustees, Charles F. Crocker, D. E. Hayes, W. C. Barnett, George C. Perkins, E. J. Molera, Irving M. Scott, John Taylor.

The committee also reported that an amendment to the Constitution had been adopted making two classes of members, and those now joining can only do so as annual members without the privilege of voting.

A discussion on this amendment took place. Colonel Charles F. Crocker said that he was very sorry that he had no opportunity to express his opinions prior to the election. This amendment would prevent many from joining the association, and he did not believe it would meet the views of either James Lick or Charles Crocker if they were alive. He was sorry that the amendment was considered practically settled.

I. E. Thayer said that there was nothing on the ticket to indicate what amendment was voted on, and he did not believe it had been adopted.

The secretary said that the amendment had been properly advertised for 60 days in accordance with the provision of the Constitution. C. F. Crocker said that it was impossible to determine which amendment was voted on at the election, and as it amended several articles of the Constitution, the amendments should have been voted on separately.

After considerable discussion, the whole matter was declared out of order and the meeting adjourned.

TERRACED BASINS OF BLUE SPRINGS, MAMMOTH HOT SPRINGS.

Springs in magnitude, and none exceed them in beauty.

The terraced overflow basins form the most striking feature of these springs. No description can do justice to their beauty, for neither the delicate fretwork of their walls nor the frosted surface of the glistening deposit nor the brilliant colors of the pools and rims can be described. The accompanying engraving of the Blue Springs, from a photograph by the U. S. Geological Survey, shows a few of the many basins, of which each differs from the others.

The walls are built up of pure white travertine, the surface resembling imbricated shells, or a multitude of miniature basins, and often covered with a brightly-colored vegetable jelly where the water is slightly cooled. These basin walls vary in height from a few inches to several feet. Their outline is rarely crescentic,

pure, but are produced by a number of tints, minute differences in depth producing variations in color in the same basin. Large as is the overflow from the Blue Springs, little reaches the edge of the terrace, the water sinking into the porous deposit or flowing into holes and fissures in the travertine floor.

The Union Iron Works, at Virginia City, Nev., give steady employment to 10 or 12 workmen. The company makes a specialty of mining and milling supplies, and is turning out some excellent work. At present there is comparatively little being done, but the plant is kept in running order and regular repair work is always coming in. Such establishments as this are of decided advantage to mining camps and should be liberally patronized where opportunity offers.

This "Y" is a large delivery air-chamber fitted with glass gauge to show the position of air and water in the same. In the delivery pipe is placed a heavy, strong check valve and also a gate valve for closing off the discharge entirely when desired. The suction to each water cylinder is taken through an elbow with easy bend, the two elbows being connected by a "Y," on top of which is placed a large suction air-chamber. The suction pipe is fitted with a foot valve and strainer, also with a gate valve to shut it off when desired.

The water plungers are made of hard iron and work through gun-metal sleeves. The valves are of medium hard rubber, backed with metal plates, and the valve seats are of brass fitted with brass bolts and springs.

The high and low pressure steam cylinders are steam-jacketed and covered with good non-

A New and Splendid Companion to all the Metal Industries.

Fully abreast of the latest inventions and discoveries, as well in the largest and coarsest as in the smallest and finest of metal work.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/4 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shapes Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS, HINOKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 218 Fremont St., San Francisco.

—MANUFACTURERS OF—

TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

DEANE STEAM PUMP.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE, Of Different Strengths as Required.

NORTEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

* Mine expenses for December not included.
(a) Also \$12,630.30, net proceeds of sale of concentrates.
(b) Bullion valued at \$47,737.30 on hand, with shipments to arrive.
(c) \$1,596 to be collected on assessment. Due for royalty, \$1,040.
(d) Bullion valued at \$3,665.71 on hand, Suto Tunnel royalty included.
(e) Also liability of \$33,849, due for royalty.
(f) Including \$14,233 received for concentrates.
(g) \$8,794 due for royalty.
(h) 13,116 ounces of bullion as an offset.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; post age, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Attention, Southern California Miners.

WORKS FOR SALE.
The Works are situated at Daguerre, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

MINING GEOLOGIST.

CHAS. F. BLACKBURN—MINING EXPERT
and practical economic mineralogist; will examine and report on the condition and value of any mining property in the State; will undertake management and scientific development of mines; gold and silver mines bought and sold; dealer in valuable non-assessable mining shares; bargains guaranteed. Address, Room 2, Boston Block, Seattle, or Mountain View, King County, Wash.

THE BRITISH SOUTH AFRICA COMPANY.

MEMORANDUM

Of the Terms and Conditions upon which Persons are Permitted to Prospect for Minerals and Metals in Mashonaland.

Prospecting Licensees.

1. Any person may take out a license on binding himself in writing to obey the Laws of the Company and to assist in the defence and maintenance of Law and Order if called upon to do so by the Company—such license to bear a stamp of the value of one shilling.

Right of Prospecting Holders to Peg Off Claims.

2. Every license-holder is free to peg off one alluvial claim and ten quartz reef claims in block. When the claims have been marked off the same shall be registered and the license-holder shall receive a certificate of registration—such certificate to bear a stamp of the value of half a crown.

Size of Claims.

3. Alluvial claims are in extent 150 feet by 150 feet. Quartz reef claims are in extent 150 feet in the direction of the reef and 400 feet broad. The claimholder may follow the reef in all its dips, spurs, angles and variations.

Terms on which Quartz Reef Claims may be Held.

4. Every registered quartz reef claim is to be held by the prospector on joint account in equal shares with the Company, and every transfer, hypothecation or lien of his interest in such claims is subject to the rights of the Company.

Registration of Alluvial Claims.

5. Certificates of registration of an alluvial claim or portion of claim in any alluvial digging are to be covered by a stamp of £1 for each month for which such claim or portion of claim is registered, payable in advance; the Company, however, claim no rights in respect to gold won from alluvial claims.

Discoveries of Alluvial Diggings.

6. The Discoverer of an alluvial digging, distant not less than ten miles from any known alluvial digging, shall have the right to peg out two alluvial claims in addition to his other rights.

Work to be Done on Claims.

7. Every digger shall, within four months from the registration of the block of claims, under penalty of forfeiture of his claim license, sink upon his block of quartz reef claims either a shaft of a depth of 30 feet in the reef or a shaft of at least 30 feet outside the reef with a cross-cut through the reef.

Certificates of Inspection.

8. So soon as the claimholder has done the required amount of work and has given evidence that he has opened up a payable reef, he shall receive an Inspection Certificate to the effect that the required work has been done—such Certificate to bear a stamp of the value of 15 shillings.

Payment of Claim License.

9. Prior to flotation the claimholder shall pay no license. After flotation the license shall be at the rate of 10s (ten shillings) per claim per month.

Flotation

10. On claims being ascertained to be payable, the Company have the right to float them into either a joint stock company or into a syndicate. The Company shall therefore within a reasonable time either make a proposal or decline to do so. If the proposal is accepted by the Claimholder he shall on flotation be entitled to half the vendor's scrip in the shares of the Company so floated. If the Claimholder is not satisfied with the Company's proposals, he has the right within one year to prove to the Company that he is in a position to float on better terms, and he shall on the flotation of the claims, give the Company half the vendor's scrip.

Pegging Out of Additional Claims.

12. Any claimholder shall be at liberty to peg out a fresh block of ten (10) claims.
(i.) When he shall have given notice of abandonment of his existing block of ten claims.
(ii.) When he has received his Inspection Certificate from the Mining Commissioner.

But no claimholder who has acquired his claim or claims as a prospector shall be the registered claimholder of more than two blocks of claims of ten claims each.

Agreement.

13. An agreement, binding prospectors to abide by the Laws of the Company under penalty of forfeiture of rights, is to be signed by all the prospectors either at Kimberley or Tuli.

By order.

F. RUTHERFORD HARRIS,
Secretary.

ITINERARY OF ROUTE.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves bailing waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, 1890, an assessment, No. 21, of Three (3) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 393 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1891, will be delinquent, and all stock for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. BARROWS, Secretary pro tem.
Office, Room 11, No. 393 California Street, San Francisco, California.

INYO MARBLE COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Keeler, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 16th day of December, 1890, an assessment (No. 11), of Ten Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 132 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
C. W. LUOE, Secretary.
Office, 132 California Street, San Francisco, California.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE \$2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

RUPTURE AND PILES.

WE POSITIVELY CURE all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of medicine, drawing blood, or DETENTION FROM BUSINESS. Terms: No Cure, no Pay; and no Pay until Cured. If afflicted, come and see us or send stamp for pamphlet. Address:

DRS. FORTERFIELD & LOSEY,
888 Market Street, San Francisco

COPPER MINE FOR SALE.—A FINE Copper Mine in Arizona; ore from 15 to 35 per cent; plenty of wood and water; 20 miles from a railroad. Vein opened up for 1500 feet; ledge wide and strong. Good chance for investment. For particulars address R. B. B. Box A, Mining and Scientific Press office.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1 SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Charges; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Consisting of Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth. 1889. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 229 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; "Parks' Process" of Assaying; Electrolytic Process; Preparation of Potassium Cyanide; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Lead; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 169 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75 Sold by DEWEY & Co. Publishers, No. 229 Market St., S. F.

The German Savings and Loan Society, 526 California Street.

DIVIDEND NOTICE.

For the half-year ending December 31, 1890, a dividend has been declared at the rate of five and forty hundredths (5 40/100) per cent per annum on Term Deposits, and four and one-half (4 1/2) per cent per annum on Ordinary Deposits. Payable on and after FRIDAY, January 2, 1891. OEO. TOURNEY, Secretary.

Practical Treatise on Hydraulic Mining. By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdies, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 290 Market St., San Francisco

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$825, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), London, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID MCKAY, JR., Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

The Garnier Ore Concentrator.

The accompanying engraving shows the Garnier ore concentrator made by the Risdon Iron Works of this city.

The table has a peculiar movement, corresponding to a "batea." The vertical shaft seen in front has an eccentric bearing at the top, which gives a rotary movement to the table and its frame at that point. The table is supported at the rear on the pivot studs seen at the side, and also by a sliding bearing in the center behind, which permits a forward and backward movement equal to the throw of the eccentric in front, but no movement sidewise, so the sand on the table is first subjected to a kind of circular batea movement, which gradually changes to a reciprocating one, as the material moves from the front to the rear end.

The machine is started and stopped without shock by means of the bevel friction wheels seen in front, the horizontal shaft running all

the time. The rotary movement of the table is derived from the vertical shaft in front by means of the cone pulleys and a band, as shown. This band is adjusted up or down, while the machine is in motion, so as to regulate at pleasure the movement of the apron over the rollers on which it is supported. The belt-shifter is adjusted and held by the hand-wheels on the stem, and every working part

of the machine is in plain view and accessible.

On the grounds of simplicity and absence of detail, this concentrator has many claims for favor, and supposing its functions, due to the peculiar movement before explained, to have the advantages claimed, the machine will no doubt meet with a wide sale, especially as the process of fine concentration seems to be increasing in favor, and also in adaptation to the requirements of present gold-mining industry in California.

The Sue Mine.

The Sue mine, shown in the accompanying illustration, is in Wall Street canyon, Calico district, San Bernardino county. As the engraving shows, the cliff of rocks, where it is situated, seems almost inaccessible. The lode

is a continuation in the northwesterly direction of the celebrated Silver King mine, and about 4500 feet distant. The mine is owned by Waterman, Porter & Osborne. The developments are largely superficial, the deepest workings not exceeding 100 feet. The vein is well defined and the ores rich. The mine has been let to obliquers who have been working it in a desultory manner.

Basaltic Caves.

On the islet of Staffa, off the coast of Scotland, the geological formation is peculiar. Regarded in sections, the rocks are of three kinds, conglomerated tufa, forming the basement; columnar basalt, arranged in colonnades, which form the walls and facades of the chief caves, and amorphous basalt overlying the columnar basalt, but pierced here and there by the ends of columns and by angular blocks.

The most remarkable feature of the island is Fingal's cave, the entrance to which is formed by columnar ranges on each side, supporting a lofty arch. The entrance is 33 feet wide and 60 feet high, and the length of the cave is 212 feet. The accompanying engraving shows the entrance.

Two ranges of basaltic rocks are supported on a lava-like mass beneath, and the unequal hardness of the materials combined with the perfection of the columnar structure, has permitted the carving out by the waves of the sea, of one of the most picturesque pieces of natural architecture in the world. These basalts belong to the miocene period.

THE Spring Valley Mining and Irrigation Co. has been incorporated.

THE GARNIER ORE CONCENTRATOR.

SUE MINE, CALICO MINING DISTRICT.

CAVE FORMED IN COLUMNAR BASALT.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Blue Gravel in Siskiyou County.

EDITORS PRESS:—As there is quite an excitement in regard to blue gravel at present in mining circles, it may be of interest to the readers of your valuable and widely circulated paper to give a history of developments on the blue lead in Cottonwood and vicinity. I have advocated the theory for three years that there was a deposit of blue gravel extending north from Butte county through Tehama, Shasta, Trinity and Siskiyou counties, California; also extending into Jackson and Josephine counties, Oregon. This is supposed to be an ancient river traversing the country from north to south, but some of our scientific geologists claim it a lake deposit or chain of lakes. It is immaterial how it was formed as long as it proves rich in gold. The first discovery made of any importance was made about three years ago by C. B. Jilson, an old and successful blue-gravel miner of Sierra Co., Cal.

Mr. Jilson had been up to Portland and was on his way back, when he concluded to stop over and take a look at this old placer camp. After viewing the old diggings which were worked in early days, he concluded that there was an old river channel underlying the sandstone formation. He proceeded to examine it and see if the Klamath river cut it deep enough so it could be opened.

One and a half miles below the town of Henley, he found prospects and indications of blue gravel, that led him to think that he had found a second Bald mountain. After the usual vicissitudes incidental to a new departure of mining in this district, where the majority of the mining population ridiculed the idea of an old channel, Mr. Jilson, being a man of energy and determination, was sure he was right and went ahead. His son Oliver came up and they went to work running tunnels to determine the extent of the gravel and see if it would justify them in bringing water on the ground for hydraulic purposes. The prospects were flattering, and to-day (after expending \$25,000 on the property) it is demonstrated that they have one of the finest mining properties in the State. The company owns one and a half miles in length by 1500 feet in width, six miles of ditch, 2000 feet of pipe, 350 feet pressure, 150 feet dump. The claim is in fine shape, and if this winter is favorable, they will take out, at a low estimate, between \$30,000 and \$40,000. The beauty of their ground is they have a million and a half of square yards of paying gravel which will go 50 cents to the square yard. The drift proposition is immense, as it will take years to work it out. Messrs. Jilson & Son are practical and scientific miners, full of energy and staying qualities. Mr. Jilson's wife and daughter left a comfortable home to share the hardships of a miner's life. They were always cheerful and willing to lend a helping hand and give cheering words of hope when things looked darkest, and now they are reaping their just reward.

The Black Jack Co. joins Jilson & Co. on the north, owning 160 acres. The company are principally railroad men, not one of them having any practical knowledge of gravel mining. They commenced shortly after Jilson & Co., and are deserving of credit for their pluck and energy for having stayed with their mine through many difficulties. At present they are getting some fine prospects. Their claim is a drifting proposition (in fact all of the locations are with the exception of Jilson & Co.). They have run an incline shaft commencing on the west rim dipping at an angle of 30°.

The shaft is down 160 feet at present and still pitting. They had milling gravel all the way, having two different lots worked here by mill process. The gravel averaged \$3 per ton. Next spring the company intends putting in a plant at the mine, and properly worked it will pay a handsome profit.

The Nelson claim of 160 acres joins the Black Jack on the north; no developments.

The Tom Paine Co. (160 acres) joins the Nelson on the north; no developments.

The El Dorado Co., 160 acres, joins the Tom Paine on the north. This property is owned by Ashland, Oregon, parties. They have just completed a hole of 166 feet 6 inch diameter, going through sandstone, pipeclay and 13 feet of blue gravel, getting some fine prospects brought up by the sand pump. North of the El Dorado Co., Burkhalter, Green, Mellet and Horn have 80 acres; no developments yet.

Seven miles north is the Soda Bar claim, owned by Wm. Smith. He has got some good prospects but will require considerable work to develop the claim.

One mile north of Soda Bar, Henry and Campbell have claims located. They have a shaft down 80 feet, but the water got so strong they had to quit until they can raise capital to put in machinery.

Wm. H. Hampton and other parties of Portland, Oregon, have located claims east of Black Jack, Nelson and Tom Paine claims. Mr. Hampton, geologist, assayer, chemist and mining engineer, thinks this a lake deposit and therefore he is sanguine that it will pay very well; hence his location east. He is at present sinking a shaft and will continue it to bedrock.

South and just across the Klamath river Wilburn & Co. have several hundred acres

located. They have prospected on the river, have found blue gravel and got some prospects. South of Wilburn & Co. are several claims located; no developments yet. Green Horn Gulch Co. in the vicinity of Yreka have struck the same lead and it is paying handsomely. Thus with the opening of the new year everything looks bright for the future of blue gravel here.

Several years ago I mined in Butte county in the vicinity of Diamond City and Centerville, on Big Butte creek. There is the same deposit of sandstone, crystalline, conglomerate, and cemented blue gravel. After I came up here and saw the formation and the prospects at the Jilson claim, I became convinced it was the same. Future developments will prove whether I am right or not. R. A. G. Henley, Jan. 1.

Gold Mining in the Older States.

EDITORS PRESS:—The writer of the article entitled "Gold Mining in the Older States," published in your issue of December 13, 1890, is laboring under a serious mistake when he says that there is no gold here. The fact that there are not larger returns of gold from the States mentioned is due to our inability to economically extract it from the ores. There are hundreds of veins and mass deposits of ore from 3 feet to 300 feet in thickness, carrying from 4 per cent to 20 per cent of sulphurets that will average from \$20 to \$40 gold per ton of concentrates. These veins also carry from \$1 to \$3 per ton free gold. Many of these veins are mostly decomposed down to water-level, and nearly all of them have been worked to that depth. This work was mostly done by negroes before the war, but all work stopped when the free gold gave out. Since the war the gold-fields of the South have been invaded by an army of so-called "California experts," each one having a "dead sure" process for working our ores.

Large sums of money have indeed been invested by our Eastern capitalists upon the magnificent representations of these self-styled experts, and every dollar so invested has been hurried or expended by these charlatans in airing their pretensions. The people, however, soon became tired of this, and a California (I) expert of this class is now a *rara avis* in this section. Intelligent and conservative minds, however, took hold of the problem, and during the past year there has been in operation on one of our mines, yielding \$4 sulphurets ores (the concentrates running about \$23 gold), a process which nets the owners \$75,000 per year. The plant consists of a 40-stamp mill, concentrators and chlorinators. The concentrates are treated by chlorination for about \$3.50 per ton. This solves the problem of successfully working our low-grade ores, but we are still on the lookout for even better. If you know of anything better, your readers here will be pleased to hear from you.

Such authorities as Genth, Hunt, Emmons, Lieber and others who have made a special study of our ore deposits agree that we have an almost inexhaustible supply of the kind of ore I have referred to. A SUBSCRIBER. Kings Mountain, N. C.

The Accident at the Utica Mine.

EDITORS PRESS:—The Utica mine is operated by two shafts, and the north shaft was the scene of the recent accident. This shaft is of two compartments with manway at south end. The shaft from the 200-foot level to the bottom is partitioned. Twenty-five feet above the bottom of the sump, in the compartment that the ore skip travels in, a platform is built to catch any rock that might fall from the skip and prevent its falling into the sump. The shaft is 550 feet deep. The hoist is double, each cable running on a separate drum, while the ore and water is hoisted by self-dumping skips.

At noon on Monday, Jan. 5th, the ore skip was hoisted as usual with about a ton of ore, to equalize the weight of the water skip, and one skip load of miners brought to the surface. The skip was then lowered and brought to within 80 feet of the surface, when the cable parted on the drum. The skip with its load of miners dropped to the platform before referred to, struck the rock that had accumulated, and breaking loose from the guides, bounded through into the water-skip side of the shaft and dropped into the water in the sump, which at that time was about ten feet deep. The water rapidly accumulated, the ore skip preventing the lowering of the water skip to the bottom of the shaft.

A pump was hastily rigged and driven by compressed air. The water from the bottom of the shaft was raised to the 530-foot level and here held by a dam. A pipe from this reservoir conveyed the water to the skip, and it was then hoisted to the surface. By means of grappling irons, three men and the half of another victim were taken out. When the water was sufficiently lowered to get at the skip containing the dead miners, a chain was fastened to the haul, then attached to the bottom of the water skip and both skips hoisted to the surface, when the bodies of five and the remaining half of the body previously secured were found in the skip, making 9 (nine) miners killed.

The names of the unfortunates were:

Dan Danielson, married.
Brice Carter, married.
Thomas Kentzrich, married.
Wm. Case, married.
David McAnn, single.
Peter Tuship, single.
P. Cupich, single.
Sebastian Ferraso, single.
Jno. Demera, single.

The breaking cable was round, 1½ inches in diameter, steel wire, with a breaking strain of 42 tons and a working capacity of nine tons. At the time of the accident the cable was carrying:

The skip, about	Lbs. 800
One ton of ballast	2,000
Nine miners, about	1,700
Total	4,500

Or one-half of the working capacity of the cable.

The break occurred at a point on the cable where, the cable having filled the drum, starts back or laps over. Here the wires of the broken cable are somewhat worn on two of the strands; none of the wires are worn through and the wires in all the other strands are apparently as when new. The worn strands first broke square off and then the wires in the others frayed out and snapped off at irregular distances. This cable had been in use but eight months, while its companion, on the water skip, has been in use for 18 months and is to all appearance good as new. That part of the cable that had been worn off would not reduce the diameter of the cable to exceed an eighth of an inch, thus leaving one inch of rope, which to all appearance would have a carrying capacity and breaking strain within a fraction of as much as the cable's capacity when new. No one who is acquainted with the superintendent, Mr. C. D. Lane, and joint owner with Messrs. Hayward & Hobart in the Utica, will suggest that the cable was kept in use when known to be unsafe, or that the accident is due to a desire to economize and use the cable as long as possible. If Mr. Lane is at fault in his management, it is in his never counting the cost when the lives of the men or the success of the mine is at stake. An old and experienced miner himself, he enters into the fullest sympathy with those in his employ and is the friend and companion of every man under him. Notwithstanding the sad loss of life at the Utica mine, there has never been, and is not now, one miner on the Utica force that has any feeling other than the kindest for their whole-souled, kind-hearted superintendent, C. D. Lane.

E. H. SCHAEFFLE.

Murphys, Cal., Jan. 8, 1891

Mining in the Black Hills.

Everything now indicates that we are on the eve of a period of prosperity which must continue for many years. The success of the reduction works will be the cause of the building of many more like institutions. The success recently attained in reducing the dry ores of the Bald Mountain belt has given an impetus to prospecting enterprises and development work, which is rapidly trading up this belt and showing it to be much more extensive than heretofore supposed. On the north end of this belt the ore is found to dip toward the foothills under the limestone formation. To the west, on the divide between Squaw creek and Spearfish canyon, there has been but little prospecting done, owing to the fact that the deposit lies deeper there than in many other parts of the belt. Discoveries have been made, however, west of Spearfish canyon. On the northeast rich bodies of this ore have been found at the head of Blacktail creek and on the other side of the divide near Garden City, dipping toward the east. On the south this belt connects with the Galena district.

Observant readers of our mining reports will note a pleasantly monotonous uniformity in the grades of ore reported, ranging from \$10 to \$40 per ton. There are some who fear that these reports are written with a bias for working up a boom, which is a very natural conclusion after so many booms in different parts of the Black Hills have each terminated to be a boom-crashing reaction against the permanent interests of the country. We have aimed to have these statements moderate and under rather than over the facts. The truth is, the public is a little slow to realize the wonderful changes which the new order of things will bring.—Deadwood Pioneer.

NEVADA COUNTY RESOURCES.—The Nevada Transcript says: Nevada county is rich in undeveloped resources. The well-beaten paths of the mining prospector have covered a large part of the surface, but untold treasures of mineral wealth yet lie hidden in the bosom of the mountain and foothill chains. The production of fruit has added luster to the star that shines resplendent "amid the grand galaxy of twinkling emblems that adorn the blue field of our great American banner," but growers have scarcely begun to appreciate the possibilities that lie in this direction. The lumber industry has hardly been tapped as yet. An immense water-power is going to waste, that some day will be made to turn wheels of manufacturing establishments and furnish employment to thousands of workmen. Through continued agitation and the use of object-lessons, she will in the course of a few years receive large accessions of a desirable character to her population, whose presence will hasten the development of our vast and varied natural resources.

Selling Mines in New York.

A New York correspondent of the Union Democrat says:

When an old Californian who knows every inch of the dear old ground, who has mined in every district, fished in every mountain stream, shot over acres of marsh and upland, fished himself anchored here, with long scope and can't get the mud-hook up, strain as he may, it just makes his bowels yearn to pick up a California paper and read of big strikes and successful mining all over the country, and especially do the said howls rumble rebelliously when he thinks of old Tnolumne. To have to stay here and endure all this rattle, rushing, crowding and struggle, when visions of the successful and quiet life you fortunates enjoy far away from this wear and tear, is decidedly rough. A man who has never exchanged all that for this rattle and hang-on't appreciate his good fortune in being spared the infliction of "high civilization," which consists in being obliged to wear a stove-pipe hat, a high collar that saws his ears, and gloves—no soft hats and turn-down collar, and to admit that you smoke a pipe on the sly is a confession to cause a loss of caste.

Do you wonder that an old Californian retires into a dark corner and relieves his pent-up feelings by letting off a few cuss words? You would do it yourself. The time was when New York had a good deal of business with and faith in California. The daddies of the present generation shipped goods and invested in mines, but the present stock is lamentably ignorant of the geography and resources of California. They know nothing of it; all they know is Wall street. If you go to them about a mine, they hold up their hands in holy horror and begin to tell you of how much money their daddies lost in mines, but never mention how much they made on the yellow soap and pickles they shipped or how much they made out of some other mine. If a man loses a dollar in a mine it is the biggest dollar that ever was, and they never cease to squeal over it, but they go into Wall street and get cleaned out root and branch, but that is all right, whereas the chances in mines are ten to one over an investment in Wall street.

I have in my mind this moment two men to whom I presented a legitimate mining proposition and only asked them to put up a small installment on a working bond, but they couldn't think of such an investment—too much risk and uncertainty. They had their legitimate business and could not depart from it—the legitimate business being dealing in shares in Wall street. I said: "There are no panics in mining, 'tis a legitimate business, and the percentage of success is many degrees above even merchandizing and a hundred per cent over Wall street." They declared mining to be a fraud. I said: "Suppose that belief was universal and everybody quit it, where would you fellows get your money to gamble on? You don't want to do it, you want 'tother fellow to do it for you. Well, wait and see how you will come out on your theory when the next panic in Wall street knocks you sky high."

Sure enough, it was not many days before a panic did come, and it so happened these very two men got it heavy. One dropped an even \$400,000 and the other over a million. It was only a day or two since that I encountered one of them in an elevated car going home, and could not resist rubbing it in a little. I said: "How about legitimate business in Wall street versus mining?" He got up, parted his coat-tails, and said: "Just kick me, will you? Why in sheol didn't you make me put a little money into that scheme? Why, I have lost enough to buy half a dozen mines." "Oh yes, of course, but then that would not have been your idea of legitimate business; you certainly could not have lost your money more effectually."

No, it is of very little use to talk mines and mining to these pig-heads. They fall back on tradition of how much money somebody lost, and talk of the wads of worthless mining stocks they fell heir to from their daddies, but when you ask how about the cords and cords of worthless railroad shares and bonds they found in the tin box, they are mum. It is exasperating to try to talk to such narrow-minded, bigoted fools. New York is no market for mines. It matters little how good they may be, the prejudice is deep seated and it is labor lost to undertake to get a dollar toward this the best and safest business of the day. If one effort in ten succeeds that one success covers all the previous losses, probably, and puts the individual ahead.

We fellows who have been there know all this, but we waste our lives and time here in this kind of missionary work, and California miners must fall back on home capital and home enterprise. There is no help from this quarter. We have a country that is unrivaled, and a business far ahead of Wall street, so let us thank the Lord that we are not doomed to live always in this cold-blooded, bigoted country. You fellows especially who live in your pious little village should be thankful. You are free from panics, and a slump of ten per cent on railroad stocks don't keep you awake nights and walking the floor. All the Californians over this side are flat busted and trying to beg or borrow money enough to get back, and they don't have much success. Every fellow that has a dollar to lend, finds plenty of customers among his own friends.

The only salvation for the busted California community rests in the faint hope that the railroads will get by the ears again and put fares down to \$25, and it would be a strain to raise that. Your sympathies should go out, too, to us fellows who are waiting to get the money for what we have sold. To make a sale of anything is difficult enough; to get the money after you have sold, is a trial of patience and endurance. These people can owe you money and come nearer not paying it than any community that I ever met. They are a cheeky lot, you bet.

MINING PROSPECTS AT NEVADA CITY.—The mining prospects in the Nevada district are considered very promising at the present time, owing to the success attending the operations in the Champion, Mountaineer and several other quartz mines, and of the recent strike of pay gravel in the Harmony mine on the ridge north of Deer creek. This gravel is giving a profitable yield, and the channel is found to be several hundred feet in width, and as the company's location covers a mile in length on the channel, there is every probability that a large extent of pay ground will be opened up. The stock in this mine could have been bought a few months ago at 20 cents per share, but it cannot now be had at less than \$5 per share. The strike in the Harmony has stimulated to activity the owners of adjoining locations, and the Fountain Head Co., the first location east of the Harmony, is making preparations to commence early operations by putting down an incline to the gravel channel. Geo. G. Allan, proprietor of the Nevada Foundry, who has equipped many mines in the county, will furnish the machinery for this mine. It is expected that the present season will witness extensive prospecting along the same ridge, which will give more activity to the mining business than has been known in the district in many years.—*Grass Valley Union*.

SOUTH AFRICAN GOLD.—A South African dispatch says that there is an enormous increase in the output of gold at Johannesburg, and that the field there promises to be the richest in the world. The Mashonaland prospectors report that in that remote part of Africa, not recently almost unknown to Europeans, they have found evidence of former occupation by a large mining population, as shown by the remains of extensive alluvial workings and shafts and excavations for small, rich leads, the quartz from which has been ground on large slabs of granite. The round stones used as crushing rollers lie about in hundreds, partially hidden by accumulated soil and tropical undergrowth.

AMERICAN SHIPS STILL LEAD.—There is a store of comfort and hope for American builders and owners of wooden sailing vessels in the statement of the Hon. W. W. Pace, United States Commissioner of Navigation, who has made a study of the subject, that the average life of American-built wooden sailing vessels is 18½ years, while that of European-built iron sailing vessels is only 13 years. These figures are surprising, but they are vouched for as absolutely correct. The reason is that the care and fidelity with which American ships are built make them excel in almost every respect. He further states that American-built iron steamships last fully one-half longer than similar vessels of British build.

LOCAL COAL RECEIPTS.—Custom-house statistics show that during December 90,520,774 pounds of coal were brought to this city, a duty of 75 cents being levied on each ton. William Chipman, the chief weigher, states that there is a heavy pressure at present on his subordinates. The entire regular force is busy, and the 13 temporary assistant weighers have been actively employed for the last three weeks. Some of them have been compelled to work at night. The indications are that the import of coal for this month and February will be greater than in December.

LARGE SMELTING WORKS TO BE BUILT.—Washington, January 9th.—The Bureau of American Republics is informed that since the passage of the McKinley bill, which places a heavy duty on silver-bearing lead ores formerly brought from Mexico to the United States for reduction, a company has been established for the erection of large smelting works at San Luis Potosi, with a capital of \$4,000,000, furnished by a New York syndicate.

SMELTING IMPORTED METALS.—The Secretary of the Treasury has issued a series of regulations to carry into effect Section 24 of the Tariff Act, providing for the smelting and refining of imported metals in crude form in bonded warehouses. They provide generally that smelting and refining metals may be done in separate establishments under certain restrictions.

A MINING TRANSACTION.—James E. Boland has sued J. R. Norton, otherwise known as Santiago R. Norton, to recover \$7000 damages for failure on the part of defendant to carry out a certain contract relative to the development of the Bonanza mine in Arispe district, Sonora.

LYNN CREEK, ARIZONA.—Hydraulic miners are sending a great deal of worked-out gravel down the stream. Farmers are already talking of baving some of their land covered by silt.

The Governor and Hydraulic Mining.

Governor H. H. Markham, in his inaugural address to the Legislature, had the following to say concerning the hydraulic-mining interests of California:

One important branch of our industries, that of hydraulic mining, is at a standstill, and will never be revived unless vigorous steps be taken by the General Government.

Congress and the courts have placed the strong and powerful arm of the law upon this industry and crushed it out of existence. I need not repeat its history, for it is familiar to all of you and to the people of the State. No relief could be expected from the General Government were the workings of these mines beneficial to the interests of this State alone. It was from the goldfields of California, however, that the millions were taken that assisted this nation so materially in her greatest financial peril.

These same goldfields have yielded the enormous amount of nearly a billion and a half of the precious metal, thereby replenishing the Treasury of the United States with that needed medium of exchange. It is said that it will be difficult, if not impossible, to devise means whereby the gold can be extracted in paying quantities without harm to the farm-owners in the valleys or injury to the navigation of certain streams. If that be true, it should be avoided. But I have such confidence in the combined wisdom of 66,000,000 of people in this country that I feel safe in saying that if an earnest effort were made on the part of the General Government for that purpose, the result would be accompanied with profit to the whole country.

In my judgment, no industry would more richly repay a reasonable outlay on the part of the Government than this.

I suggest, therefore, that the subject be thoroughly agitated, Congress memorialized and our Senators and Representatives urged to take all necessary steps to bring the matter properly before Congress at the earliest moment possible. Congress properly expends thousands of dollars every year in experiments and investigations which in the opinion of its members will promote the public interests of the country. For instance, a special committee has been created on irrigation of arid lands, and a liberal appropriation is annually made for the purpose of studying the subject. The most thoroughly qualified men of the age are employed for this work, and all the means that science and skill can evolve are brought into requisition in solving the problems. Many other instances, familiar to all, of the liberal action of the Government could be cited. Why should not Congress treat this question in a similar manner, and assist in a solution of the difficulties surrounding the production of gold? It is a matter of national interest, for this metal is accepted by all men as a medium of exchange. Within the borders of California, millions upon millions of gold are locked up in the bowels of the earth, awaiting the genius of man to devise some feasible method of release, and I urge you to take the initiative in obtaining the assistance of the Federal Government.

PROPOSED MINING BUREAU.—For the promotion of mining matters in the Great Basin, says the Salt Lake Tribune, some gentlemen are talking of incorporating a Mining Bureau, to be made up of the solid men of this city and including others in Utah Territory and adjoining States. The capital will be large enough to handle good properties and for the development of prospects. The bureau is to have its own engineers and experts, and whenever a property is placed in their hands there will be thorough examination and reports. On such properties as are reported favorably the bureau will engage to raise funds and develop in the interest of investors. The promoters of this enterprise say that there is much money in the East which is awaiting investments in good enterprises, and if such a bureau as here named was established upon a solid basis and managed by judicious and well-known business men, this money could be diverted to this immediate country to help develop the many mineral lodes now lying dormant. They also say that such a bureau would be the means of putting a stop to the unloading of worthless claims or prospects upon a confiding public through misrepresentations. These gentlemen believe this plan will work good to this great mining country and greatly assist in making this industry more popular than it is now.

THE lobsters spoken of some time ago as being planted in the Sound have been heard from. The Kitsap Pioneer says: A former employee of the United States Fish Commission steamer, the Albatross, stated that he had recently found some of the lobsters in the Bay of Utsalady, across the Sound from where they were planted, and that he found them in several other places, showing that they are rapidly propagated. Several other persons have reported finding lobsters at various points on the Sound.

GOLD HILL MINES.—The Virginia (Nev.) Enterprise says: The promise of good result from the pumping operations in Gold Hill is really good. When deep mining was being carried on in that section, things looked bright. A drift was cut out from the 2200 level of the Crown Point toward the Exchequer line, and

the miners were drowned out by a flood of hot water as soon as they struck a strong body of pay ore, and before that they had already commenced to explore a very promising looking body of ore in the Bolshoi mine. This makes two bodies of ore in existence about which there is no question, excepting as to their extent. It is proposed by means of the present pumping operations to prospect the bodies of ore discovered so many years ago, and to this extent they are working for a certainty.

The Blue Lead in Siskiyou County.

The Yreka (Siskiyou county) Journal says: The interest manifested in the last few months in the "blue lead" which is supposed to run through this county from north to south, and which can be easily traced on the surface throughout the entire county, has induced investigation into the history of the several "dead river" channels which have been worked in this State. This investigation demonstrates that every one of these channels, wherever found, has been rich in gold. The dead rivers of California, so far as known, are on the western slope of the Sierra Nevada range, from 500 to 7000 feet above the level of the sea. The most notable of these was known as the Big Blue lead, which was traced and worked from Little Grizzly, in Sierra county, to Forest Hill, in Placer county, a distance of 65 miles. The elevation is 5000 feet above the level of the sea at Little Grizzly, and 2800 feet at Forest Hill. It is estimated by scientific men that this river was ten times as large as the present Sacramento. A great many million dollars were taken from the "Big Blue." A number of other channels have been worked out, and a number more are now being worked, all of which have been and are very rich. The usual location of these dead rivers is about 30 miles west of the Sierra Nevada and parallel therewith. Some of these channels run under high mountains, which are tunneled through. In other places they have been raised above their early locations, and are found, as above stated, at an elevation of 7000 feet above the sea.

There is no doubt, from all indications, that one of these dead rivers ran through what is now Siskiyou county—whether north or south is not yet known. It has been suggested by a celebrated writer that this might have been the Columbia river, and that it extended through the entire State, but as yet there is no positive evidence that such is the case. Wherever this channel has been reached in this county, it has been rich, as demonstrated at and in the vicinity of Cottonwood, and north of that place nearly to the Siskiyou, where Mr. W. H. Smith has found the channel and good prospects. What has been and is being done in Cottonwood mining district, we need not describe in this article, as our readers are well informed on that subject. Suffice it to say that mining men of experience and large capital are investing heavily in that section.

The probabilities that there is a dead river channel running within a mile of Yreka are so strong that a number of our citizens are making an organized effort to prospect it. These gentlemen have secured locations along the line of the channel for a distance of 2½ miles, and will proceed without unnecessary delay to give the matter a fair test. This, of course, will involve an outlay of some money, and, as is usually the case, the men who are moving in the matter are men of limited means, and will expect assistance from all who are interested in the development of Siskiyou county in general and Yreka in particular. A corporation, which will embrace in its business mining for gold and coal, will be formed, and all who are disposed to help in the enterprise will be given an opportunity to do so. We earnestly hope that our citizens will not be backward in this matter. All must realize that if there is a rich channel in this valley, its development will be of great importance to our business interests. If nothing is developed, no one will feel the loss of the little they subscribe to test it. It is anticipated that within a few weeks at the longest, boring with machinery will be commenced.

BULLION PRODUCT.—The detailed account of the bullion product of the Con. Cal. & Virginia mine for the month of December was as follows: Worked at the Eureka mill, 7040 tons of ore. Bullion produced—Gold, \$46,054.75; silver, \$53,977.12; total, \$100,031.87. Yield in bullion per ton—Gold, \$6.54.2; silver, \$7.66.7; total, \$14.20.9. Value of ore per ton as per battery assay, \$18.77.4. Additional bullion from assay office, Virginia City: From bar granulations, \$575.56; from fine dust, scraps, etc., \$2395.45; total, \$3471.01. Total value, \$103,502.88.

THE agitation in the matter of silver purchases and free coinage during the past 18 months has greatly stimulated the mining industry, and consequently good mining properties have been in good demand. While the price of silver has been subject to fluctuations, still the opinion is held by leading financiers that a free-coinage bill will eventually carry the day.

THE Paradise Valley M. & M. Co.'s property in Humboldt county, Nevada, has been sold at sheriff's sale for \$19,740.44 to W. J. Bell, who bid it in.

THE reduction works of the Eureka Con. M. Co. have been closed down until the spring.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE KENNEDY MINE.—*Dispatch*, Jan. 10: We understand that the last month's cleanup at the Kennedy mine amounted to over \$27,000, which was an increase of about \$2000 over the previous month's run.

SUTTER CREEK.—*Amador Ledger*, Jan. 10: There are no new developments to report in the mining situation. At the North Star a body of water has been encountered within the last two weeks, which is considered by mining men an excellent sign. Drifting at the Rose mine continues in a southeasterly direction, with nothing new to report. A slight change has taken place in the management of the Lincoln mine. Mrs. Stewart has leased the property to the employees, which relieves her of all care and anxiety. The men feel confident of being able to make it pay. The Wildman is keeping up its reputation as one of the best properties in the county. The 30 stamps are kept running steadily. The ledge is very wide, and nearly all pay rock. The ore seems to improve with depth, and no doubt in the near future a new shaft will be sunk. At the North Star, crosscutting is still going on, and they only lack about 40 feet going southeast to reach the point where the rich ore was struck in the level above. Crosscutting is still in progress at the Rose mine, and there is sufficient encouragement to induce them to continue. The Lincoln mine is running along steadily, with Charles Smith in charge of the mill and Steve Moyle foreman at the mine. The Sutter mine is taking a temporary rest. Again the Mahoney is to be started ere long, according to Dame Rumor. Mr. Valentine is making arrangements for the construction of a large pipe to connect the Amador canal and the mill, the iron for which is said to be on the way.

Calaveras.

RICH GRAVEL.—*Calaveras Chronicle*, Jan. 10: Dave Lamson, of Railroad Flat, one of the owners of the Lava Bed Gravel Mine, showed us nine ounces of gold, the yield for two men's work for fifty days. The gold is what would be called by miners "coarse." The only water with which the gravel was washed was that pumped into a large tank from the mine. The gravel was put through three or four sluice-boxes, the operation continuing until the tank was emptied, then suspended until the tank was refilled. The working shaft is about one hundred feet in depth. No "breasting" has yet been done. The mine is one of the most promising gravel mining properties in the State. When the mine is fully opened, suitable milling machinery will be put up and the mine worked on a big scale, **Inyo.**

THE CAMPS.—*Inyo Independent*, Jan. 9: Mining business in the county is not very lively at present, but this is usual every winter. The Newtown mine at Cerro Gordo is turning out a good deal of ore; prospecting goes on in the Union, but no rich strikes are yet reported. Very little is doing in the Darwin district; Mr. McKenzie has a small force at work in the Lucky Jim but is not taking out much ore. Shipments continue to be made from the Defiance and about 15 men are working there. Regular shipments are made from Modoc, most of the ore at present being taken from the dumps. Mr. Fitzgerald has about a dozen men at work in the mine. It is reported that Mr. J. J. Gunn has recently struck a good prospect in the Minnietta. Pat Key is doing first rate at the White Hill and has two carloads of fine ore ready for shipment.

LEE DISTRICT has been regarded as one of the most promising mining regions in the county. It is somewhat isolated, however, and this has retarded development. For some weeks past Mr. S. W. Buck of Keeler has been doing some prospecting there, and recently some rich ore was struck. A sample lot was sent to Mr. James A. McKenzie of Darwin for assay, and he gave the following as the result, 1068.47 ounces of silver per ton. All Inyo miners know how thoroughly reliable an assayer Mr. McKenzie is. Mr. Buck says he has five tons of ore similar to assay sample ready for shipment. The mine is called the True Blue, and was first located by Charles E. McElvay several years ago. Very little work had been done upon the mine before Mr. Buck began operations.

Mariposa.

STRIKE NEAR COULTERVILLE.—*Mariposa Gazette*, Jan. 10: A strike has been made in the Black Bart mine. The mine is situated in an easterly direction from Coulterville, and what is known as Lovely Roger's gulch. Work was begun by the present ownership in April, 1890, and the indications for good rock were most favorable from the start. Other parties had heretofore prospected it without any marked success. Since their beginning, and up to the present strike, the mine had produced something like \$3000. In or about December last, the mine had been sunk to the footwall and the new vein was struck much richer than that which they had been working up to this date. The last strike was made on the footwall covering the bottom of the seven-foot shaft. When first opened up, the gold was found in a formation of porphyry and iron, and then running into white talc; the gold finally going directly to the footwall. The result of the find, so far, foots up about \$10,000; the sum was taken from 1,400 pounds of rock. This makes the output of the mine by the present owners figure up to some \$13,000. The good rock continues, and the indications are favorable for a much larger yield in the immediate future.

MILL BUSY.—Some good rock is now being taken from the No. 9 mine. The mill is kept busy and it may be that mining in that locality may again revive.

CRUSHING.—Henry Boisse is said to be crushing some very rich rock taken from his mine, near the Black Bart. Having no mill of his own, he packed his ore on burros over a trail to the Bruschi mill, nearly five miles distant.

Nevada.

A VALUABLE MINE.—*Transcript*, Jan. 7: Oscar Newhouse, the owner of the Diamond D (Eagle Bird) mine, has taken up his residence at the mine, which will, in the future, be worked under his personal supervision. The property has developed wonderfully under the management of Mr. New-

house, as it is said that there is now in sight enough ore to keep the 30-stamp mill running for the next ten years. In the spring more stamps will be put in, and the mine will then be in a position to pay a steady dividend on a valuation of \$2,000,000. The best of it is, the same property was offered in London some years ago, and refused, the imported expert, as usual, seeing nothing in it. The property is not now for sale.

REDUCTION WORKS AT NEVADA CITY.—*Grass Valley Union*, Jan. 7: Reduction works are to be established at Nevada City by a San Francisco company for treating refractory gold and silver ores by what is known as the lead-bath smelting process. The foundry building near the narrow-gauge railroad depot has been leased in which to place the machinery. The capacity of the works will be 24 tons a day.

THE HARMONY.—*Nevada Transcript*, Jan. 13: A partial cleanup made Sunday at the Harmony mine gave \$700 for the gravel taken out in six days with four picks. Some of the gold was coarse. Everything is working nicely. Twenty-four men are employed by the company and the monthly running expenses approximate \$2000. The mine is a little more than paying its way at present, although the only income is from the gravel taken out in running ditches. When the channel has been prospected and breasting begins there will be fifty or more men at work. The Harmony gives every indication of being largely remunerative for years to come.

CONSOLIDATING TWO PROPERTIES.—It is announced that W. W. Stow has purchased from the owner who now resides in Virginia City the Walcott gravel claim, adjoining the West Harmony, which is owned by Messrs. Walrath and Isard, and that the two properties will be consolidated and worked as one. Mr. Stow is said to have paid Walcott \$6500 for the ground.

COLD WEATHER AND MINING.—*Grass Valley Union*, Jan. 13: The freezing weather that has prevailed for some days past has had the effect of lessening the water supply of the ditches, and on Saturday the mining companies of this district were all compelled to suspend milling operations and economize their water power for the purpose of using it for pumping and hoisting, and some of them have found it necessary to start up their steam machinery as a supplementary power to do this work. The main trouble in regard to the water is on the upper portion of the South Yuba Canal, where there has been severe freezing weather, which has frozen water in the bottom of the canal, making anchor ice, and in consequence the flow of water has been lessened daily, which has prevented the supplying of the mining reservoirs with the usual amount, and some of the mines have been entirely deprived of water. Within the last forty-eight hours the weather has moderated somewhat, and it is likely that within the next two or three days the usual quantity of water will be available, and that all the stamps of the district will again commence dropping.

San Diego.

OWENS.—*Julian Sentinel*, Jan. 9: Work on the Owens mine is steadily progressing. The 300-gallon bucket is working splendidly, and the water is down to the 200-foot level. The shaft is 340 feet deep, and it is calculated that it will take about two weeks to get all the water out.

Shasta.

RICH STRIKE.—*Redding Free Press*, Jan. 10: Mr. Connor of the Skyblue mine informs us that a miner, recently from Nevada State, named J. Nugent, has opened up a rich prospect on Rock creek. He has a tunnel 62 feet long, and a ledge that he has traced 700 feet, which, being prospected, shows rich rock along its length. The ledge was capped over by an iron deposit, but underneath shows up well. All the ore taken out so far is good milling, and some of it is so rich that good wages can be made with a band mortar. Mr. Nugent was "put on" to this deposit by Mr. Connor, and is well pleased with his prospects. He is a miner of experience and knows a good thing when he sees it.

Siskiyou.

QUARTZ.—*Yreka Journal*, Jan. 7: Myron Carrick and Archie Nichols continue to find very rich specimens in their quartz ledge at Spring Gulch on Yreka Flats, northwest of Yreka, with the ledge about a foot thick in the bottom of their prospecting shaft. The specimens shown us contained about as much gold as quartz, which they crush in a hand mortar, realizing considerable money for current expenses.

BLUE GRAVEL.—The Lee, Lash & Co. blue gravel claim at Greenhorn, about a mile south of Yreka, is now being fixed up in good condition for more advantageous working. Owing to the bedrock pitching, it is necessary to cut a drain to the pump shaft, upon the completion of which a large force of men can be put at work in drifting blue gravel for raising to the surface by the steam hoisting apparatus now in position. The men at work on the drain have found several rich prospects in the black rock or cement covering the blue gravel deposit, indicating that this formation may be lava run over the bed of a stream from volcanic eruption in prehistoric ages. Prospecting for blue gravel seems to be all the rage just now in mining and efforts will be made to commence boring with machinery in this vicinity and throughout the entire watershed of the Klamath river south of Siskiyou mountain, also of Rogue river in Oregon and the streams running westward into Del Norte and Curry counties on each side of the California and Oregon boundary line. A test of this kind may prove that the bedrock in Yreka basin covers blue gravel containing gold, as Yreka Flats was the richest mining district on the coast in the first half of the '50 period, and the main attraction for inducing immigration to this county, the population of Yreka City at that time being fully 5000, with very few women and children. The Boyle quartz mine at head of Humboldt has been shut down for the winter in consequence of the snow and cold weather, but in the spring a large force will be set at work. The force at the Spencer mine, lower down, has also been reduced until spring, when a large force will be employed. Work on other quartz claims and placer diggings along Humboldt has also been suspended to a great extent. This district, when spring opens, will be one of the liveliest mining camps in the State, furnishing more employment for miners than any other district in the county.

Trinity.

CANYON CREEK.—*Trinity Journal*, Jan. 10: This week we paid a flying visit to Canyon creek and

found about a foot of snow on the locations of the Fisher Gulch Co. The mill was not running, as the snow and cold weather had shortened the water supply. Last week advantage was taken of the little water running to start up the mill and crush a few tons of ore. The mill worked well and the amalgam showed the rock to be of good grade. The ore-bin is full of ore and there are about 100 tons of good ore on the dump. The lower tunnel is being continued and the indications point to cutting the ledge in a few feet more. As soon as water starts up, work will be actively pushed on this property, and, from all appearances, with good returns. Development work is being carried on in the Bailey group of mines and the property is looking well. All indications point to the development of one of the biggest mines of the coast. Grigsby & Shattuck are running the mill on the Buck's Ranch mine, taking out ore and pushing things generally. The company have already made one cleanup that was entirely satisfactory. They are opening up a fine property.

NEVADA.

Washoe District.

CON. CAL. & VA.—*Virginia Chronicle*, Jan. 10: 1200 level: Continue to extract some milling ore from above the line of drift running south of the east crosscut No. 1 from the south drift from the shaft station. 1300: Continue to extract some ore from the point where the upraise carried up from the end of the east crosscut from the south drift connected with the fourth floor stopes. 1500 level: From the drift run north from the drift run west from the upraise carried up from the north lateral drift (43 feet above the sill floor of this level) at a point 20 feet in the drift, an upraise has been carried up 30 feet, and at this height we find some ore of about the average grade of our extraction. 1600: Continue to take out some ore along and above the line of the drift run east through the old stopes on the sill floor of this level; also from the stopes which we are working southerly from that drift. At a point 200 feet south from the north line of the California ground we have been working upward through the old stopes for the last two months. At a point 44 feet above the sill floor of this level a south drift has been advanced 24 feet, and from this south drift a west drift has been advanced 15 feet. The top portions, say two-thirds of the whole drifts, are in ore of good quality. The bottom portions are in ore of poor quality. Taken as a whole, the ore showing in these two drifts gives an average assay value of \$30 per ton. 165: Usual quantity of ore extracted from the various openings on this level. There has been extracted from all parts of the mine during the week 1620 tons of ore which was shipped to the Eureka mill. The average assay value of all of the ore worked at that mill during the week (1620 tons) was \$18.50 per ton. Bullion shipped to Carson Mint, assay value \$36,411.25. Bullion shipped to the office in San Francisco, assay value \$3471.01.

OPHIR.—The drift started north from the drift run west from the winze 122 feet below the sill floor of the 1300 level has been extended 26 feet; total 24 feet; continuing in quartz of very low assay value. No ore has been extracted during the week.

MEXICAN.—East crosscut No. 1, 1465 level, started from the main north lateral drift at a point opposite the west crosscut No. 1 has been extended 33 feet; total 265 feet; continuing in a porphyry formation which has become somewhat solter.

UNION CON.—East crosscut No. 2, 1465 level, started from the north lateral drift at a point 200 feet north from the south boundary line of the mine, has been extended 29 feet; total 213 feet; continuing in porphyry which carries some clay and some quartz.

SIERRA NEVADA.—Northwest drift from the shaft station, 630 level, has been extended 55 feet; total 284 feet; continuing in porphyry formation without any change.

BEST & BELCHER.—800 foot level: West crosscut No. 2 has been extended 12 feet; total, 408 feet. Formation porphyry and quartz. 1200 level: At a point in upraise No. 1, 100 feet above this level started a west crosscut No. 1 and extended it 14 feet; total, 39 feet. Formation hard porphyry.

BELCHER.—West crosscut No. 1 from the shaft is out 491 feet, having been advanced 80 feet during the week; face in soft porphyry and streaks of quartz, with some water running from it. Are mining from the fifth floor of the old 1300 raise and are finding some streaks of fair grade ore.

KENTUCK.—Finished grading on 1000 level and resumed work in face of east crosscut, same level. Face in porphyry and streaks of quartz.

YELLOW JACKET.—Are shipping daily 60 tons of ore, battery assay, \$18.18 per ton, and doing extensive prospecting work.

JUSTICE.—The north drift, 822 level, is out 189 feet; face in hard rock. The 492 level south winze is down 33 feet. The bottom is in fair grade ore. Shipped to the mill during the week 194 tons of \$16.59 rock, as per battery samples.

UTAH.—Northwest lateral drift from the shaft, 725 level, has been extended 54 feet; total length, 234 feet. Face in porphyry and clay.

SAVAGE.—During the week we have hoisted 739 cars of ore from the 300, 400, 500, 600, 750 and 1300 levels, and from the winze below 1300 level. Shipped to the Mexican mill 535½ tons of ore; ore milled, 545 tons; average battery assays, \$16 a ton. The winze station in the ore body from the track floor, 1300 level, is down 35 feet and continues in ore of good quality.

HALE & NORCROSS.—On the 1100 the north drift was advanced 240 feet, and has reached north boundary line. This drift followed the west boundary of the vein. We will start crosscutting east from the face of this drift the coming week. The north-east crosscut on this level was advanced a total distance of 228 feet; face of this crosscut has reached the east clay wall of the vein.

CHOLLAR.—On the 750 level are sinking a winze 100 feet south of north line to connect with 850 level. It is down 6 feet in quartz assaying from \$20 to \$30 per ton. Extracted and sent to the mill during the week 541 tons of ore, the average battery assay of which was \$21.40 per ton.

POTOTS.—The south lateral drift from the Chollar incline on the 1230 level is out 605 feet. In the face there is a streak of quartz 3½ feet wide assaying from \$12 to \$25. The south lateral drift from the Chollar incline, 1300 level, is out 180 feet; face in porphyry.

CON. NEW YORK.—The north drift on the 650 level is in 145 feet; face in porphyry. East crosscut

150 feet north of shaft, 1100 level, is in 61 feet; face in quartz and porphyry.

SILVER HILL.—Northeast drift from the winze on 160 level is out 570 feet; face in porphyry. Northwest drift, 334 level, is out from shaft 780 feet; face in hard porphyry.

EXCHEQUER.—The east crosscut 150 feet south of north line, 500 level, is out 380 feet; face in clay and porphyry. East crosscut near the south line, 600 level, is out 227 feet; formation porphyry and clay.

ALPHA.—The east crosscut, 70 feet north of shaft, 600 level, is out 260 feet. Face in clay and porphyry.

GOULD & CURRY.—200 level: Northwest drift is out 175 feet. It has been stopped and at a point 70 feet northwest of crosscut No. 2 we started to put in square sets in the old fill, with the idea of raising through them. In cutting out for sills some new ground was encountered, showing some spots of ore. For last week extracted 20 tons of ore of fair quality.

OVERMAN.—Extracted 425 tons and 1200 pounds of ore. Shipped to the Brunswick mill 433 tons and 1640 pounds of ore. Upraise from northwest drift on the 1100 level has been extended 86 feet and timbered. Have nine feet of ore in the face. On 1000 level southwest drift has been extended 88 feet; formation, porphyry with seams of clay.

ALTA.—Mine and mill closed down. Only watchmen employed and over 50 men thrown out of employment.

CROWN POINT.—Are extracting from the 1800 stopes from 8 to 10 tons of ore per day that assays from \$18 to \$20 per ton and storing it in the dump.

ANDES.—During the past week north drift, 420 level, was advanced 15 feet through a formation of porphyry, quartz and clay.

CONFIDENCE AND CHALLENGE.—The joint Confidence and Challenge north drift on the 300-foot level is now in 146 feet, six feet having been made during the week. The face still shows two feet of fair ore. The drift is now 10 feet in Confidence ground.

CON. IMPERIAL.—Considerable work is being done on the upper levels in following up and taking out small streaks of ore and overhauling the old stopes.

SEG. BELCHER.—The south drift from Belcher shaft, 600 level, is now out 44 feet in Seg. Belcher ground. Face in soft porphyry.

Tuscarora District.

DEL MONTE.—*Times-Review*, Jan. 9: North drift, first level, has been extended 14 feet without material change.

NEVADA QUEEN.—East drift on fourth level of Commonwealth will prospect the vein close to the line.

NAVAJO.—The stope below the 350-foot level is getting deeper going north. The ore continues high grade. Have broken about three tons of first-class ore showing considerable native silver.

BELLE ISLE.—The stope on the 350-foot level continue to look very well. The grade of the ore is improving. Sent to mill 40 tons of ore; battery assay value \$375.70 per ton. West crosscut from the 450-foot level extended 27 feet; water flow is diminishing. Have started a joint-line crosscut to the east, same level, progress 11 feet.

NORTH BELLE ISLE.—The 500 stopes are without material change. South intermediate line from No. 4 chute extended south six feet; still showing good ore in the face. An upraise from the 500 has been started opposite the vertical winze to give access to the stopes which have extended south beyond that point. Sent to mill 20 tons of ore; assay value \$14.6 per ton. Hoisted 129 cars of concentrating ore; estimated assay value \$76 per ton. Concentrator crushed 366 tons; estimated assay value, \$14.54 per ton.

COMMONWEALTH.—Fourth level: Have started joint crosscut at North Commonwealth line opposite joint raise, which has reached the hanging-wall, exposing some good ore. East crosscut extended 30 feet; rock hard; slight flow of water.

NORTH COMMONWEALTH.—Fourth level: Joint raise has reached the hanging-wall, passing through seams of good ore. Work suspended at this point and joint crosscut started to cut the vein on the level. West crosscut from No. 1 south drift, second level, advanced 30 feet, cutting strata of fair-grade ore. Intermediate drift extended south, opening up good ore. Hoisted 63 cars of concentrating ore. The different parts of the mine have all been caught up and is now in good condition.

ARIZONA.

ORE MARKET.—Mohave *Miner*, Jan. 10: In regard to the ore market for the ensuing year, the *Miner* sent out inquiries to different sampling works, and their replies show that to all appearances prices and sampling charges will be considerably higher than the past year, and especially so on extremely high-grade dry ores. Indications show that instead of paying 95 per cent of the silver value as heretofore, the smelters will only pay from 90 to 93 per cent, according to grade and character. Smelting charges are apt to range higher, from \$2 to \$5 per ton on lead as well as dry ores, excepting that ores would get so scarce that the smelters would be compelled to pay better prices in order to run their furnaces. The treatment on ores now is unreasonably high, and will no doubt be reduced as soon as the money market is somewhat relieved.

FLORES.—John H. Campbell, Superintendent of the Flores mine, intends to commence the erection of a ten-stamp mill on that property as soon as the machinery can be got on the ground. The mine has been opened up in good shape and large quantities of high-grade ore have been extracted. The ore body opened up in the south drift is six feet in width and averages between \$60 and \$70 per ton. To Mr. Campbell's energy and ability is due the present satisfactory condition of this mine.

NOTES.—*Prescott Courier*, Jan. 9: John Hartin has been doing some work on a ledge near the Iron Spring house, a short distance west of Prescott, and thinks said ledge worthy his consideration. The rock is gold bearing. The road crosses the ledge near D. Walker's place. It is large and well supplied with gold. Charley Rose is working in a ledge east of the Peck which is rich in silver. He found float and croppings in the bed of the creek which runs east from Bradshaw Basin. He is going to ship several tons of it. Frank Alters has been looking at the Yarnell lode, near Peeples Valley. He says it is one of the largest ledges he ever laid eyes on. The vein matter is spar, streaks of decomposed

iron in it carrying much gold. It is thought that the entire body of ore will yield from \$10 to \$14 per ton. The Fortuna mine, near Walnut Grove, is yielding silver nuggets. Barlegh drills will, we are told, soon be set at work at the Senator. Messrs. Brown and Cochrane are examining properties in the Bradshaws. Lester Jackson, who has just made a tour of Bradshaw, says they are taking gold rock from the Crowned King that will work \$500 a ton. The vein is opened in good shape. Miners of Tip Top district are increasing their shipments of ore to El Paso. The Congress continues to ship large quantities of concentrates and high-grade sulphur. S. C. Mott's workmen were hoisting good ore out of the Prince, which will soon be worked at the Tuscumbia mill. A great many men are working in the Boggs mine, Big Bug district. A. G. Dillon came here recently from Hillside district. He left the "boys" taking out shipping ore. Wm. A. Linn, who went to Cherry district to locate claims, found the miners well satisfied. Some of them are working ores in arastras. Lynx Creek hydraulic miners are said to be taking out plenty of gold. The diggings are eight miles east of Prescott.

SMELTER WANTED.—*Phoenix Herald*, Jan. 8: The necessity of a smelting plant near this city has long been apparent to the close observer of our mining affairs, and to-day that necessity is becoming imperative. A gentleman visiting Phoenix a day or two ago, superintendent of a large and rich mine in the Bradshaw country, made the statement that he could furnish ten carloads of ore daily for such a plant, and his is but one of the important mines in that region of country that would turn out five to ten carloads per day for many years to come. We have the lead ore, the lime and everything necessary to the successful working of a smelter plant at hand, and hundreds of thousands of tons of ore now on the dump that cannot be shipped out of the country to be worked, are waiting the coming of a smelter near enough to them to save part of their value to the miner.

BRITISH COLUMBIA.

HOT SPRINGS DISTRICT.—*Nelson Miner*, Jan. 3: A shaft has been started on W. W. Sprague's Tenderfoot, and 2 shifts are engaged in the work of sinking. Work will be resumed on the Old Timer the coming week. The tunnel on the Early Bird is in 30 feet, in ore all the way. This claim is situated close to the lake shore about a mile above Ainsworth, the ledge showing 4 feet of solid mineral. An ore-shed has been built near the mouth of the tunnel, where the first-class ore will be dumped so as to be handy for shipment to the Revelstoke smelter in the spring. Good progress is being made in sinking the Skyline working shaft. A. A. McKinnon is doing some development work on the Crystal. A new location called the Devil's Cash has been recorded by E. A. Bielenberg. It is on Woodbury creek.

COLORADO.

THE LAST DOLLAR.—*Aspen Times*, Jan. 10: The Last Dollar in Tourtelotte Park is one of the mines of this district of which the public hears very little. When Sam Bigelow staked it he named it the Last Dollar, simply because he had expended his last dollar for grub and the last of the grub had been exhausted. The main working incline has been sunk to the fifth level below the old level connecting with the bottom of the Justice shaft, and it has shown ore nearly all the way down. At places the contact has been lean, but there is a very good showing in the bottom and it looks as though the ore chute might be as large there as it is above. This incline can be driven nearly 1000 feet in Last Dollar ground, and the possibilities of development are beyond computation. The ore body that the leasers opened while working from the old shaft through the tortuous workings, has proved to be of enormous size. The leasers run into it but never had any idea how large it was. Since the shaft was sunk deeper and the new plan of development carried out, this ore body has been opened to a height of nearly 70 feet. There proved to be practically no banging-wall, only ribs of lime separating the strata of ore. The grade of the pay mineral is universally good, although there are immense quantities of ore that will not now pay but that will eventually become marketable. The mine is said to have a capacity of 300 tons of ore per day that will run from 12 to 20 ounces. The wall rock in every direction runs well, and when this is mined the stopes will be great caverns. The ore now produced carries from 50 to 80 ounces silver, and much of it is heavy in lead. Mr. Brown has the south end of the property leased and is shipping considerable ore from it that runs 60 ounces.

SILVER STRIKES.—*Denver Republican*, Jan. 3: Some very rich strikes have been made in Carpenter district of late which are attracting considerable attention and causing quite an influx of miners and prospectors to that section. Carpenter district is situated on the west side of the Black range, eight miles from Kingston. A majority of the producing mines in the Hennon district are now in the hands of companies and are being worked vigorously and with paying results. Considerable stimulus has been given to mining operations in Apache district, of which the town of Chloride is the center, by some rich strikes of late both in gold and silver. Formerly the mines were worked quite successfully, but owing to the long distance to haul the ores to the railroad, operations at one time were almost at a standstill. These late discoveries of pay ore in large quantities, together with a new concentrator in course of construction, will give that camp new life and energy. The Garfield mine here is taking out some of the richest ore in the district. The mine is under lease to George Robier and Stephen Marcy, who have now in sight and on the dumps 3 carloads of ore, which they will soon ship to Pueblo. The ore runs up in the hundreds in gold, besides silver and copper to more than pay the expenses of transportation and reduction. The Richmond Gold Mining Company has the machinery for its new mill here on the ground, the sheds and buildings almost completed, and by the 15th of January will have their new plant in operation. They will treat their own ore, mainly from the Mamie Richmond mine, and afterward buy ore to keep the mill running.

LEADVILLE.—*Georgetown Courier*, Jan. 10: The production of the Leadville mines during the past year was a little over \$11,000,000. In 1889 the production was over \$13,000,000. The body of ore

opened up in the Comet over which there was so much excitement some time ago has opened up as large as ever. The ore is being piled up awaiting favorable silver legislation.

MINERAL.—A remarkable piece of mineral was blasted from the footwall of the famous Lamartine mine a few days ago. The dimensions of the piece are 7x11x4 feet. Its weight is about twenty tons, and its value not less than \$4000. The block is composed entirely of solid mineral, and if it could be brought out whole would be one of the finest mineral specimens extant.

THE TUNNEL of the Berthoud Pass Canal Company will be in the neighborhood of a mile in length, and 600 feet below the summit of the pass. The tunnel will be 6½ feet in height, the Pacific end ten feet wide and the Atlantic end 6 feet. One hundred feet of the eastern end is completed, and work is progressing with a single shift per day. It is not expected that it will be completed before the summer of 1892.

DAKOTA.

SEABURY.—*Deadwood Pioneer*, Jan. 10: No men are working on the Seabury just at present, the force having been taken off some time ago. When work was stopped, a large body of low-grade ore was in sight, but it was deemed advisable to shut down until some means of reducing it were in operation. When the Iron Hill smelter starts up again, the Seabury will furnish plenty of ore to run it.

RICHMOND.—*Machinists*, under direction of Supt. Havens, are overhauling the Richmond mill, with a view to starting it up in the spring. This will greatly benefit Galena, as there is a large amount of milling ore on the dumps there, that is too low grade to pay the expenses of shipping and smelting.

COLUMBIA.—A small force is working on the Columbia location, which is situated near the town of Carbonate. Indications on the ground are favorable, although no ore has been found.

NORTHWESTERN.—Some parties have relocated the famous Northwestern Co.'s ground, within the town limits of Carbonate, and are doing work on it. **THE FIRST ORE.**—*Deadwood Pioneer*, Jan. 9: The first ore shipment out of Deadwood by way of the railroad was a car of Cora ore, and was sent out by S. C. Fargo & Son. The ore was hauled by wagon from Galena, and averaged over \$300 per ton.

CHLORINATION WORKS.—A gold brick is on exhibition at the Deadwood National bank, weighing 445 ounces, the result of a ten days run at the chlorination works. The brick is valued at \$8900. Everything is working nicely at the plant, and about seventy tons of ore are being treated daily.

IDAHO.

ORE SHIPMENTS.—*Wood River Times*, Jan. 7: The following statement of ore shipped from Hailey during 1890 is obtained from the books of the railroad company. By comparing the figures with those for 1889 it will be seen that the output for last year was over double that during the preceding year:

Name of Mine.	Pounds.
Idahoan.....	1,120,000
Red Elephant.....	942,000
Red Cloud.....	493,000
War Dance.....	493,500
Jay Gould.....	319,500
King of the West.....	295,500
Carrie Leonard.....	153,000
Nettie.....	153,000
Nay Aug.....	130,000
Camas.....	49,000
Crosses No. 2 concentrates.....	1,099,000
Odd lots of lease ore.....	1,175,000

Total for 1890.....7,570,500
Total for 1889.....3,698,625

Increase.....3,871,875

A GROUP.—*Idaho World*, Jan. 9: Wm. Sweet has a group of four mines at the head of Muddy, on the Payette divide, that are located magnificently for easy working. The mountain on the Payette side is very steep, and the mines can be tapped at a depth of 800 feet. Mr. Sweet will first sink a shaft to the depth of about 300 feet, and if developments then justify such a tunnel it will be run. The four locations are on one vein, which carries pay ore along the surface the entire distance, and the ledge is large.

COAL.—David Falk, of Boise City, was over at Horseshoe Bend the other day for the purpose of forming a coal company to develop the coal mines of that section. Pard Bowen has recently taken a claim, and will sink 100 feet. Hon. R. H. Robb's vein is showing up finely.

TUNNEL.—Wm. Hagler and Fred Day went up last Wednesday to finish the tunnel running to tap the Silver King, which is located a short distance north of the Washington. The tunnel is now in about 50 feet.

MONTANA.

WILL THOROUGHLY DEVELOP.—*Inter-Mountain*, Jan. 7: Preparations have been made to thoroughly develop the True Fissure group of prospects a few miles north of Livignost. The first contract, which has been let, calls for an extension of the 60-foot shaft to the ore body, which, from its dip, is known to lie directly beneath the present workings. **BOUGHT THE GROUP.**—Five claims on Camp creek, contiguous to Butte, bonded last spring to Angus McQueen, have been sold to a syndicate represented by Charles Chapin of Castle. The consideration is not made public. It must be considerable, however, as one of the properties transferred has been worked at a profit all summer and fall.

THE ANNA C.'S STRIKE.—The recent strike in the Anna C. at Castle is proving greater than first reported. The tunnel has been advanced to feet since the strike, exposing an ore body the full width of the drift. The mine will be thoroughly exploited in the present workings, after which a new tunnel will be started 500 feet lower down the mountain, through which the mine will be worked permanently. The Anna C. gives every promise of developing a bonanza.

BI-METALLIC EXTENSION.—*Phillipsburg Mail*, Jan. 9: Outside work has been going along nicely in the past ten days. The shaft-house is being com-

pleted and the two 70-horse-power boilers are almost in position ready for work. The pit for the engine foundation is being excavated, and the work on the masonry foundation will be commenced to-day. The plant will be in running order early next week, when sinking will be pushed. The new shaft-house with other buildings in this new camp of Comstock presents a neat and substantial appearance. This company have let a contract for the chopping and delivering of several hundred cords of firewood, so that the supply of fuel will be assured for several months to come.

LOWER CALIFORNIA.

ALAMO.—*Cor. Lower Californian*, Jan. 8: There are none but encouraging reports to send out this week from Alamo. A few sorehead miners have left the camp during the last week because they could not get as high wages as they would like, but their places are easily filled by other good miners and at present there are no idle miners in the camp who care to work. Since I wrote you last there have been several important steps taken toward developing the mines not owned by the Princessa Co. Of these might be mentioned the work on the Tarantula, which, in the hands of the wide-awake and modern American, Mr. Mitchell, is handsomely yielding up the yellow metal. Mr. Sherard is still going ahead on the Butler mines and the work on the Scorpion is driving ahead under the foremanship of Mr. Phelps and an efficient force. The Princessa Co. has received its compressor and boiler for the steam drill which will be placed in the Indian mine, where the rock is hard. Mr. Quick, who was formerly foreman on this mine, is in the same position on the Scorpion, while Billy Lawry, late foreman on the Princessa mine, has gone north to look for greener fields. The El Paso mill will crush the rock from the Butler mines.

NEW MEXICO.

ELIZABETH.—*Phillipsburg Mail*, Jan. 3: No mine in Montana is attracting more attention at present than the Elizabeth, and all are hoping that she will develop favorably, as indications promise now. At 472 feet in the shaft, where the crosscut was commenced, the miners were driven out last Saturday by water, and until the new Knowles pump was put to work Sunday morning no further underground work was done. It now transpires that the long-looked-for lead has been struck in the Elizabeth. It is said that the vein which was struck during the last week has a fine appearance and has every indication of being rich, though nothing definite as to its assay value can be ascertained, as the officials of the company at this end are reticent and will divulge nothing. The strike, however, has leaked out.

MINE PURCHASE.—*Silver City Enterprise*, Jan. 9: Capt. Cooney returned from Socorro this week, where he had been to purchase the old Cooney mine and the Silver Fountain, formerly the property of the Silver Hill Mining Co. The property was bought in under a judgment executed for the purchase price, \$29,458.35. During the working days of the property it produced \$50,000 and paid a dividend of \$50,000, but when it failed to pay the company refused to put up, and it has lain idle for several years. The Captain will resume operations after a little.

THE JOHNNY BULL MINE at Stein's Pass is developing at great depth more extensive and richer bodies of ore than were ever encountered nearer surface. First-class miners are now wanted there at \$3 a day. The ores of the Johnny Bull are carbonates of copper with occasional pockets of very rich carbonate of lead, and carbonates of iron, carrying silver and gold. Prospecting work will be carried down to a depth of 200 feet and crosscuts driven at 150 feet to strike the mother vein.

THE FLAGLER WORKS are soon to be enlarged and put in shape for all kinds of ores. It is likely that the ores of the Alpha and Omega, now being shipped at the rate of one car per day, will be treated there.

UTAH.

MINE SALE AT TINTIC.—*Salt Lake Tribune*, Jan. 4: Matt and Pat Condon have been mining in Tintic the past ten years. Few men have done harder work or stuck closer to a mining camp than these brothers have to Tintic, and few have had more abiding faith in the final outcome of that mineral district. They still own some claims there, one lying between the Mammoth and old Copperopolis, which promises well. They did own a group of claims joining the Centennial-Eureka on its south end and extending over south across the summit for nearly a mile. The group consists of the Belcher, Lucky Jack, Rosa, Pine, Red Rapper, Cane, Molliet and Contact. Some time ago they agreed to give one-fourth interest in each of these eight claims to New York parties if they would sink a shaft 700 feet deep or run a tunnel in 700 feet, just as was deemed best. The parties started in to sink a shaft on the Belcher and put in some machinery for that purpose. In November last they took a bond on another one-fourth interest in these claims for \$23,000, and later they got an option on the other one-half for \$100,000. Yesterday they closed the contract and paid the first \$10,000 in cash. The new owners are to go ahead and develop the property and pay a royalty on all ore extracted until the mines are paid for. The Condon Bros. thus get \$123,000 for the eight claims besides what they may receive in royalties up till the final payments are made. Lying as this property does on the Centennial-Eureka extension and running off toward the Mammoth, with ore on the surface running 40 to 50 ounces silver, it certainly promises well for becoming a great mine. The vein crops out 200 feet wide and can be traced out all of 4000 feet. Shafts have been sunk at five different places to a depth of 18 to 20 feet, in each place exposing good ore.

STRIKE IN THE KENTUCKY.—*Park Record*: We again have the pleasure of announcing a new discovery of ore. From time to time items have appeared in these columns regarding the progress of work on the Kentucky claims, Nos. 1 and 2, under lease to William O'Connell. After sinking to the depth of about 70 feet the shaft cut a nice vein of ore, carrying 82 ounces silver and 75 per cent lead. The vein where cut shows about three inches of ore and is widening out with each hour's work that is

being done. This is undoubtedly the same vein the Creole is working to such good advantage at present. This proves beyond a doubt that Treasure Hill was rightly named, and that it is filled with the precious metal. Mr. O'Connell will crowd work on his discovery, and besides continuing the shaft will drift both ways on the vein. The ore is of the same general character found on that hill and the indications are that Mr. O'Connell is close on the trail of a fortune.

ORE AND BULLION SHIPMENTS.—The Ontario mill shipped this week 32 bars of bullion, amounting to 19,401.57 fine ounces silver. This week the Crescent shipped 370,000 pounds of concentrates, making the grand total for all the mines, 1,262,040 pounds. There were received and forwarded from the Mackintosh sampler for the week ending January 10th, the following lots of ore: Ontario, 172,830 pounds; Daly, 132,420; Woodside, 29,410; Anchor, 444,920; May Flower jiggings, 12,350; Nevada Northland, 160,100 pounds; total 952,040 pounds.

THE EAGLE'S NEST GROUP.—The discovery made by Mr. A. E. Hollenbeck and others below town, is turning out immense. Quite a number of assays have been secured from the property and all show a high grade of ore. A sample assayed yesterday showed 548 ounces of silver and 60.1 per cent lead, with \$17.36 in gold. There are ten claims in the group and developments have commenced in earnest. A shaft-house has been erected and a force of men put to work to sink a shaft on the ledge. All the vacant ground in the neighborhood has been located and active developments begun.

Please Remit.

The beginning of a new year is a good time to settle up the debts of the old ones. We are obliged to remind those who owe the PRESS on subscription account, that it will be a great convenience to us if they will soon remit what is due. Those who can also pay in advance will also do us timely and well-appreciated favor. We are doing our best to present a very valuable paper, representing carefully, earnestly and conscientiously the welfare of its intelligent readers and the best interests of the arts, sciences and mining and mechanical industries of the Pacific States.

To do this we deprive ourselves of some of the most lucrative lines of patronage available to the average newspaper.

By paying as promptly as possible, friends, you will greatly encourage us in our sincere efforts to favor you and the best interests of your calling.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

SIMONDS SAW CO., Jan. 10. Capital stock, \$50,000. Directors—John Simonds, Daniel Titus, T. F. Haworth, E. H. Simonds and H. A. Sargent.

PASO FRUIT CO., Jan. 10. Capital stock, \$48,000. Directors—N. J. Bird, J. C. Quinn, G. B. Warren, A. O. Alexander and A. J. Booth.

THE MARKET ST. CABLE RAILWAY CO. has filed amended articles of incorporation to increase the directorate and to construct certain extensions. Directors—Leland Stanford, Chas. F. Crocker, Timothy Hopkins, N. T. Smith and J. L. Willcutt. Chas. F. Crocker is vice-president and J. L. Willcutt secretary of the board.

CITY R. R. CO., Jan. 10 (amended article). Directors—Leland Stanford, Charles F. Crocker, Timothy Hopkins, N. T. Smith, W. V. Huntington, C. E. Green and J. L. Willcutt. Charles F. Crocker is president and J. L. Willcutt secretary of the board.

SAN JOAQUIN VALLEY WAREHOUSE CO., Jan. 14. Capital stock, \$500,000. Directors—Jacob Eppinger, Barry Baldwin, H. Dutard, James Hogg, B. Eulinger, Jas. W. Sperry, Richard D. Girvin, all of S. F., and George and A. B. Sperry, S. S. Bostwick and J. D. Peters of San Joaquin.

COPTIS M. CO., Jan. 14. Capital stock, \$10,000. Location, Nevada. Directors—A. V. Lancaster, W. J. Hayes, H. M. Whitely, E. M. Hall Jr. and J. H. O'Brien.

NAPYAS M. CO., Jan. 14. Capital stock, \$10,000. Location, Nevada. Directors—A. V. Lancaster, W. J. Hayes, H. M. Whitely, E. M. Hall Jr. and J. H. O'Brien.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

H. KELLEY—Modoc and Laeven Coe.
Geo. WILSON—Sacramento Co.
J. P. QUINTELL—San Francisco.
J. C. HOAG—San Francisco.
J. H. CROSSMAN—San Bernardino Co.
F. W. KNAPP—Amador Co.
GEORGE EVANS—Santa Clara Co.
MRS. M. E. DUDLEY—Ventura Co.
W. U. WATSON—Sutter and Yuba Cos.
WILSON MCNICKE—Fresno Co.
ANDREW BRID—Monterey Co.
FRANK S. CHAPIN—Colusa Co.
HELEN B. KING—San Benito Co.
WM. M. HILLARY—Oregon.
WM. HOLDER—Oregon.
H. G. PARSONS—Central California.
ELMER JENKINS—Del Norte Co.
H. C. HENKLE—Capay Valley.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCRIPPS PRESS Patent Agency (S. F.) from week to week and year to year.

MECHANICAL PROGRESS

DELTA METAL AND ANCIENT ALLOY. According to the Glaser's Annalen, delta metal is a very old alloy, having been known to the old Egyptians. It was first prepared, however, in a scientific manner by Alexander Dick, a German, in 1882. This metal is an alloy of copper, iron and zinc, resembling alchemical and stero-metal, which contain the same elements and are largely used for heavy guns. The delta metal is prepared by taking advantage of the fact that melted zinc will dissolve about 9 per cent of its weight of iron. The saturation point of the zinc depends upon the temperature of metals during the process—the higher the temperature the greater the amount of iron absorbed. At a white heat nearly 20 per cent is taken up. The fluid alloy is then mixed with an amount of copper or copper and tin, which varies according to the purpose for which the metal is intended. The oxides present are removed by the addition of a small quantity of manganese, usually in the form of copper manganese alloy. This metal is tough like wrought iron and has a golden color; it can be drawn into wire and rolled either hot or cold. At a dark red heat it is easily welded and stamped, by which process it is said to become 50 per cent stronger than wrought iron. When melted it is very fluid and can be easily cast, the castings being uniformly dense and showing a fine crystalline fracture on being broken. The melting point is 1,750° F., and the specific gravity is 8.6. It is said to be less affected by the air than phosphor bronze, brass or red bronze. One of its leading excellences is that it perfectly withstands the action of salt water.

THE MANUFACTURE OF CATALAN IRON IN FRANCE.—The industry, which barely 25 years ago was of considerable importance in the Arize district, is still carried on in all its primitive style, with more or less prospect of continued vitality. The workmen engaged in it receive about the same wages as those paid in other industrial occupations in the same locality. The price of the catalan iron is not, as a rule, higher than that of the wrought iron now generally used; it is often less. It is only exceptionally used for general work, because it cannot be obtained in the various exact dimensions of rolled bars, and also on account of its hard steel-like nature, which makes it more difficult to manipulate in working. A good deal is made into bars, suitable for farrier's work, which sell at something like 31 to 32 francs per 100 kilos. Many rough agricultural tools, as plowshares, coulters, mold-boards, etc., are made directly from the bloom (*loupe* or *manse*) as it comes from the forge. These parts, being shaped under the large hammer, are naturally not always so well finished as those made under the small tilt-hammer from modern rolled merchant iron, but they are mostly of a presentable shape and find a ready market, as many are convinced that the metal, as it has special properties, must also be possessed of particular virtues. It certainly wears better, on account of its hardness, than the ordinary forgings, and is sold somewhat cheaper.

AMERICAN CARS AND LOCOMOTIVES FOR FOREIGN RAILWAYS.—Two complete trains of drawing-room cars have just been completed for the Buenos Ayres & Esmeralda Port Railway Company by the Gilbert Car Manufacturing Company of Troy, N. Y. The whole of the material is of the highest class, and the cars are of handsome design and finish. The Government of New South Wales has placed with the Baldwin Locomotive Works an order for 12 10-wheel passenger locomotives, somewhat similar to the engines of the same type built for the Baltimore & Ohio, and now running very successfully on that road. The *Railroad Gazette* says limited weight—on account of the bridge—makes it necessary to reduce the dimensions somewhat, while the application of materials is altered to conform to the practice of the New South Wales Government. The engines will have screw-reversing gear. The service for which they are intended is to haul passenger trains weighing 144 gross tons at a speed of 22 miles per hour up a grade of 176 feet per mile, or trains weighing 176 gross tons at the same speed up grades of 130 feet per mile, there being curves of 528 feet radius on the 130-foot grades. In all important respects the engines will conform to American practice. These engines are to be built with the utmost dispatch and shipped direct to Sydney by steamer.

CAST-IRON TUNNELS.—Two tunnels of cast iron for an electric railway have been built in London and put in operation for rapid transit. They are three miles in length and lie between 40 and 60 feet below the surface of London streets. The tunnels for the up and down lines are formed of cast iron from beginning to end, save where the stations are built, and their diameter is 10 and 10½ feet. The tubes are formed of rings 1 foot 7 inches long, made in sections and bolted together. The tunnels were driven by means of a short cylinder, a trifle larger in its inner diameter than the exterior diameter of the cast-iron tunnel lining. This cylinder has a cutting edge, and is forced forward by hydraulic jacks, butting a circular way into which the lining plates are fitted. The narrow space between the lining and the soil was filled with lime cement forced in under high pressure. In their course the tunnels pass

beneath the bed of the Thames and through the bed of an old water-course, where loose, wet gravel offered some trying obstacles for the engineers to overcome. The entire cost of the line fully equipped was less than \$3,750,000.

WIRE BELTING.—The successful introduction of late of steel wire, in a braided or woven form, as belting for driving machinery of various kinds, is a notable fact, and in respect to which good judges express different opinions. Metallic plates or bands, it is remarked, have been used more or less for belting many years, but however perfect their working may have proved in some cases, they are almost beyond hope of repair when trifling weakness begins to show itself, and though braided or woven belts of wire may be more easily repaired, and if made of a comparatively firm wire would in all probability hug a pulley over its entire width more perfectly than could any hand made of plates or sheets, the fact still remains that the absolutely unyielding nature of the material of which the wire is made, at the points of actual contact, is wholly different from that of the slightly compressible leather or rubber-covered canvas generally employed. It is urged, therefore, that equally favorable results could hardly be expected to attend the use of wire fabric without the yielding material being supplied in the shape of an elastic cover fitted to the pulley. This, however, introduces in an impartial manner the element of wear, and the pulley-covering would no doubt be rapidly destroyed.

MEANS BUSINESS.—That the recent Government armor-plate trials are considered of great importance, is fully shown from the fact that 34 carloads of nickel ore were shipped from Sudbury during the last week of October, their destination being the Navy Yard, Washington, D. C. It is, of course, in the rough, just as it came from the mines, and will have to be smelted and then be kept in the yards until arrangements are perfected for the separation of the nickel from the baser metal with which it is mixed. The nickel will be used for the naval tests going on in this country, taking the more extensive use of the nickel and alloy for armor plate. As the quantity will be very large, even after it has been reduced by the smelting process, there will be enough metal to last for some time.

NEEDLE-MAKING AN OLD INDUSTRY.—The Municipal Council of Saint Omer, in the north of France, has decided to celebrate, next year, the 400th anniversary of the foundation of the first needle factory in France by Christopher Greening, an Englishman. The process of manufacture was greatly improved by one of Greening's successors, a Frenchman named Jean Gruz, who made a large fortune; and the reputation of Saint Omer's needles spread even abroad, surviving in England until the last century. The needle industry in France is at present in a decaying condition, all the finer sorts of needles sold in France being made in England.

COATING WITH LEAD.—Philadelphia manufacturers have a process for coating all kinds of metallic substances with lead, thereby making them rust-proof. They exhibit a number of articles coated with lead which have been exposed to the weather and immersed in acids, that do not show any change, either from the action of the weather or the acids. Some shingle nails, so treated, placed side by side with galvanized nails and exposed for a long time, show no appreciable change, while the galvanized nails show signs of rust.

RAILWAY BRAKES.—An exchange very correctly says: There is a chance for some practical inventor to change to advantage the whole idea of train braking. The brake should be applied to the rail and not to the wheels of the train. Brakes applied to the wheels simply permit the train to skid, and produce flat places on the wheels. Brakes applied to the rails would ease up the momentum of the train in friction between it and something not within itself, which is the thing most desirable.

THE FIRST USE OF THE COMPOUND ENGINE for marine purposes in this country was as long ago as 1825. During that year James P. Allain of New York built compound engines for the Henry Eckford, and soon afterward for several other steamers—notably for the Sun, which made the trip from New York to Albany in 12 hours 18 minutes, with steam at an initial pressure of 100 pounds.

"SOMETIMES," writes a correspondent of a trade paper, "I have had to make holes in steel that was too hard to cut or file easily. Then I make a mixture that will cut a hole. I mix one ounce of sulphate of copper, quarter of an ounce of alum, half a teaspoonful of powdered salt, a gill of vinegar and 20 drops of nitric acid. This will make a hole."

STEEL-BAR TEST.—At a test of steel manufactured at Reading, Pa., the other day, a one-inch bar broke at a strain of 233,333 pounds, "being about 20,000 pounds in excess of the highest record authoritatively known." The test was made under the supervision of Government officers.

IT IS SAID that an Australian photographer secures excellent pictures at a distance of 16 miles.

SCIENTIFIC PROGRESS.

Storing Electric Energy.

Very few people, except those who make it a special study to keep up with scientific progress, know how electric energy is stored or anything definite in regard to the principle or construction of a storage battery, but the whole thing is very simple—in fact any person can make a storage battery for himself. The *New York Tribune* makes this matter very plain to the most ordinary understanding.

The Principle of Electric Storage.

A storage battery consists of a cell, usually of glass or rubber, filled with diluted sulphuric acid, in which flat lead plates are immersed. But a storage battery does not store electricity, as is commonly supposed by the uninitiated. Electricity is not a thing, but a form of energy, and it is this electrical energy that is stored. Falling water is one of the many familiar forms of energy, but we cannot store a waterfall. We can store its energy, however, by making it wind up a spring or pump water—part of itself, perhaps—into a reservoir, or compress air, or lift a heavy weight. Then at some future time this stored energy can be used to do work. The wound-up spring, the water in the reservoir, the compressed air or the lifted weight may represent a part of the energy of the waterfall, and either may be made to do work. Here we have the energy of the waterfall lifting a weight—that is to say, separating two things, the earth and the weight, that have a strong mutual attraction. The weight, when raised, is said to have energy by virtue of its position, and if allowed to fall it can do work and reproduce the exact amount of energy expended in raising it. For example, it could be made to pump water back to the top of the fall; then this water could fall again and raise the weight. However, in doing this a little of the energy is lost or wasted each time by the friction of the machinery and the air, and presently our see-saw arrangement would come to rest like any other see-saw or swing. So it is with a storage battery. We can fill it with electrical energy. If we allow a current of electricity to flow through a storage battery, the electrical energy separates certain elements of the battery that have a strong chemical attraction for each other, and when these elements are allowed to "fall"—that is, resume their former or natural state—the stored electrical energy is reproduced in the shape of an electric current. Just as the falling water raised the weight, and again the falling weight raised the water, so the electric current separates the battery elements, and the battery elements, resuming their natural state, reproduce the electric current. But here, too, as in the other case, energy is lost or wasted each time the change is made, and a state of rest is the final result. For continuous motion or power, we must have an endless source of energy. Coal, wood and waterfalls represent some of our reservoirs of stored energy.

How Any One Can Construct a Storage Battery.

The simplest form of storage battery can be made by any one with a test tube or a tumbler. Fill it about three-quarters full of water; then pour in sulphuric acid slowly, very slowly, not faster than a trickle, and at the same time stir with a clean stick till the solution is very acid to the taste. Mind you never on any account pour the water into the acid, for that would rapidly generate great heat and might do serious harm. Now stand in the tumbler or cell two flat pieces of sheet lead as wide as the cell will permit and tall enough to reach one or two inches above the surface of the acid solution. Place two clean rubber bands around one of the plates—one band near the top and the other near the bottom. Then bind the two plates together with two rubber bands so that the two lead plates do not touch each other anywhere. Connect one plate by means of a copper wire to one pole of a battery or dynamo and the other plate in the same way to the other pole of the battery or dynamo. Finally, allow a small current to flow—about one or two amperes. If the source of electricity is too powerful, place a resistance in circuit, such as German silver wire or incandescent lamps. When the current has been flowing for about four or five hours it will be noticed that one lead plate has become brown and the other gray. Now disconnect the wires from the source, and on touching the two ends of the wires together a small spark will be noticed. If the ends be kept together for a short time the storage battery will discharge itself and must then be recharged. After the first charge the brown plate, which is called the positive plate, must always be connected to the positive pole of the dynamo or source for the purposes of recharging. If the storage battery be charged and discharged a good many times the capacity of the battery will be greatly increased—that is, a greater discharge can be obtained compared with the charge. This process of charging and discharging is called "forming," and until a storage battery is "formed" it will return but a small proportion of the current or energy used in charging. In discharging the acid will become weak, but in charging the strength of the acid is wholly restored.

ELECTRIC ADHESION.—The question of the reality of electrical adhesion and of making a practical use of it in operating railroad trains

is still under discussion among engineers, with the odds in favor of the affirmative. It is claimed that adhesion is clearly manifested even when the rails are covered with water or oil. The advantages which it is thought may be derived therefrom are claimed to be manifold. It would seem to be a matter of ready proof whether there is anything in it or not. The philosophy of the principle, if it exists, is thought to be in a slight heating and consequent softening of the surfaces of both wheels and rails. It is well known that even a weak current of electricity produces a great heat upon the surface of iron when passed over it.

Ancient Roman and Pompeian Relics.

Some new discoveries have been made at Pompeii, near the Stabiana Gate, and a description is given of them. *Nature* states that three bodies were found, two being those of men and the third that of a woman. Not far from the resting-place of these bodies was the trunk of a tree, 3 meters in height and measuring 40 centimeters in diameter. This tree, together with its fruits that were found with it, has been examined by the professor of botany, M. Paquale, who finds in it a variety of *Laurus nobilis*. By means of the fruits, since they come to maturity in the autumn, he concludes that the eruption did not take place in August, but in November.

The Roman city of Cissa was last mentioned in 679, and even its site has long been forgotten. Submarine ruins lately found indicate that the island was sunk by some catastrophe. The *English News* states that the commission in charge of the improvement of the city of Rome has unearthed great quantities of lead water pipe, each plainly stamped with the name of the owner of the house, the year of the plumbing, the names of the consultants for that year, and that of the reigning emperor. In opening the 32 miles of new streets in that city, material has been found sufficient to add to our present knowledge a thousand details concerning the baths, heating flues, water pipes and house-sewer pipes, the organization of the police and fire brigades, etc.

Known Before.

From the excavations at Pompeii, instruments have been found, both surgical and dental, almost identical with our own. In others, as in the works of Hippocrates and in the "Susruta," a commentary on the "Yajna Veda" of the Hindoos, full descriptions are given of more than a hundred surgical instruments of steel, of many kinds of bandages and the specifications for a splint, like the patented bamboo splint now used by the British army surgeons. Susruta also describes surgical operations which are claimed as glories of nineteenth-century surgery. The surgical operation for the stone, and the rhinoplasty, or that which consists in making an artificial nose from flesh and skin taken from the patient's own forehead, were fully known and practiced by the ancient Hindoos; and, finally, the aseptic treatment of wounds, one of the glories of modern surgery, is proved to be a rediscovery. Hippocrates, in his book on wounds, which is a small manual on this method of treatment, describes it and calls it by the Greek word for non-putrescible.

MODERN GUNNERY—SHELLS THROWN FIFTY MILES.—A very good idea may be formed of the possibilities of modern gunnery from a brief account of some experiments recently made at Sandy Hook, near New York. The gun was a 30-foot cast steel rifle with a 12-inch bore. The gun was first loaded with 100 pounds of powder and a hollow shell. The charge of powder was gradually increased until 250 pounds was used as a load. The gun stood the heavy charges, but the report was heard nearly 40 miles down the coast. The gun was pointed out to sea and Corporal McDonald was sent off shore in a small boat to see how far it could throw the big shells. The men in charge of the gun were warned by signals later to stop throwing shells into the sea, as several vessels were approaching the mouth of the harbor. Corporal McDonald says the gun hurled the shells a distance of nearly 15 miles.

NOVELTY IN ICE MANUFACTURE.—It is said that among the new inventions seen at the recent Mechanics' Fair at Boston, a method was shown of making ice by simply dropping a few crystals in water—the secret of whose composition is only known to the inventor. Not only is the ice made in a remarkably short space of time, but ice-cream is also manufactured and eaten by those who stand and wait.

NATURE'S PROCESSES.—The study of the radiation of the fire-fly demonstrates that it is possible to produce light without heat other than in the light itself; that this is actually effected by nature's processes and that these are cheaper.

INCANDESCENT LAMPS placed near the ceiling will cause it to blacken, contrary to general belief. The blackening is due to a current of hot air which deposits black particles on contact with a cold surface.

TENACITY OF PLATINUM.—It is said—but it should be taken with some grains of allowance—that platinum can now be drawn into wire strands so fine that 27 twisted together can be inserted into the hollow of a hair.

ENGINEERING NOTES.

Restoration of Abandoned Canals.

The value and importance of canals as a means of transportation is once more coming to the front, after the long sleep to which such conveyance was relegated by the advent of the railroad. Many old canals are now being again brought into use, and new ones are being suggested or are in actual process of construction. In connection with this revival of an old and almost obsolete mode of transportation, the subject of

Improvement in Canal Propulsion

Forms a most important matter of consideration. It always happens that new discoveries revive and awaken to new usefulness arts and agencies that are fast becoming obsolete. Thus electricians are trying to chain the lightning to the sleepy canal-boat. There can be no objection to overhead wires in that case. The water-power from locks and overflows furnishes power to drive the generator, and only a screw propeller and an electric motor on the boat are needed to complete the chain of mechanism. The points of weakness in this project are that in the majority of canals propulsion by any power that sits up the water is not permissible on account of the washing-down of the banks, and that the water-power would not be sufficient in canals running across flat countries where canal systems are most feasible. Even under the most favorable circumstances, the dry season would be apt to cripple the plant.

Steam on Canals.

In the State canals of New York, after a protracted trial, steam canal-boats have conquered prejudice and become established as indispensable. There are perhaps 100 such boats already in service, and each is capable of towing from three to five other boats. One of the finest of the steamboats—the John B. Dallas—is 96½ by 17½ feet. Her machinery consists of a 14 by 16 inch cylinder engine, fed from a large boiler built to stand a pressure of 140 pounds to the square inch. The consumption of coal from Buffalo to New York is about 45 tons, at \$3 per ton for pea. She can herself carry 6100 bushels of grain, and can tow four other boats of 3300 bushels capacity each, making the capacity of the fleet 39,300 bushels. With two boats in tow, the John B. Dallas makes the trip between Buffalo and New York in a trifle over seven days, and with four boats in tow she makes it in about 10½ days. Under the old style of boating it requires six horses or mules to bring two boats from Buffalo to New York City in 13 or 14 days.

Inclined Planes for Canals.

An interesting paper was read at the recent congress at Manchester, England, on canal navigation, by M. Flamant, on a system of inclined planes, to supersede the use of locks on canals. Inclined planes have been coming into use for this purpose lately in which a water-chamber receives the boat, and the whole is drawn up the plane. The chamber has, however, been placed lengthwise to the track, and thus, if the boat is of any length and the incline at all steep, a large chamber is required to maintain the water level for the length of the boat. By the system described by M. Flamant, the water-chamber is placed with its length across the track, and the gradient of the plane is fixed at one in two. It is proposed to connect the ascending with the descending boat chamber by chains to economize power.

The Mule Must Be Superseded.

In this day of steam, electricity and fast transportation in general, the motive-power of the old canal—the mule—cannot be considered as a thing to be continued. In discussing the question now being agitated in Eastern Pennsylvania and New York in regard to the necessity for remodeling the motive-power employed by the Washington & Cumberland Canal Co., in view of the rapidly increasing coal and timber business crowding upon their lines of transportation, the *American Manufacturer* says: The motive-power of the old canal—the mule—is not to be thought of. Steam offers but few more advantages, because it takes up so great a percentage of the carrying capacity of the boat, while the looks and the amount of help required stand in the way of using tugs. It was finally suggested that electricity should be used. The trolley system, by which small screw propellers could be run by electricity, was looked upon as the best solution of the problem. By using electricity the weight of machinery to be carried would be small, and one man could control the motor and the steering apparatus without trouble. The plan is under serious consideration, and will probably be given a thorough test. If it prove successful it may result in the restoration of abandoned canals and induce capital to seek an investment in new ones between points where heavy freight not requiring rapid transit are shipped extensively.

A Portage Railway for Canal Boats.

But the projects of those who are laboring for the restoration of the Chesapeake & Ohio canal do not stop here. It is proposed to build a portage railway from Washington, D. C., to the terminus of the canal, at Annapolis, Md., on the Chesapeake bay, for the transportation of the canal boats, cargo and all. By this means the boats could reach not only tidewater but almost any port on the Atlantic. They could be built on the plan of the lately devised

sea-going coal barges used in transporting coal from Norfolk to New England cities. The boats could be loaded at the mines in the Cumberland coal region, and without rehandling the coal could be delivered at any seaport on the Atlantic. The great objection to shipping coal partly by boat and partly by rail is the breakage of the coal in handling. This scheme would do away with that entirely, and Cumberland coal could be shipped "all water" to any port on the eastern coast without handling at all.

The timber and coal freights of the region traversed by the canal have increased from comparatively nothing to thousands of tons within a few years, and the monthly reports of Cumberland coal shipments show a regular increase that is amazing. As yet nothing definite has been done in the project we have outlined, but the slightest examination will show its great possibilities.

A FIRELESS LOCOMOTIVE FOR MINES.—M. C. Rolland, in Mons, Belgium, has constructed a fireless locomotive for use in mines. It is provided with a tank that holds 0.550 cubic meter. The water is heated to 205° C. (or an absolute tension of 16 atmospheres) by a boiler placed on the surface; it is sufficient for a steady run of three to four kilometers. The heating is brought about by means of steam jets, as first proposed by Mr. Bede, Belgium. The heat thus stored up in the rather small space gradually evaporates the water required to run the machinery. At a speed of two meters per second, the locomotive works with six-horse power, that of a horse being generally estimated at from 0.9 to 1.0 m., so that the locomotive, working day and night uninterruptedly, takes the place of from 12 to 18 horses, besides a good many laborers. The saving is calculated to be \$200 per horse dispensed with. As a further advantage, this locomotive secures better ventilation. The weight of the locomotive is 3000 kg.

RISE AND PROGRESS OF STEAM NAVIGATION. In 50 years steamships in Great Britain have increased in tonnage from 67,969 to 4,318,153 tons, while their proportion to the total registered tonnage of British ships has increased from 1 to 41 to 1 to 214. The first Condors were only 207 feet long and 34 feet 4 inches beam, while the first steamer which plied regularly between Liverpool and New York, the Royal William, measured only 175 feet in length. The steps by which the marine engine has developed have been, first, the screw propeller, then the introduction of iron and steel in the building of ships, then the increase of steam pressure in the boiler, then the adoption of surface condensation, followed by the use of compound and duplicate expansion cylinders, and a much larger increase in boiler pressure, rendered possible by the use of mild steel in the construction of boilers, thus effecting in all a reduction of 70 per cent in the consumption of coal and an increase of 110 per cent in speed.

PROGRESS ON THE HUDSON-RIVER TUNNEL.—The *Scientific American* of Jan. 3d says that about 470 feet have been added to the Hudson-river tunnel since Nov. 1, 1890, which brings the total completed length up to 2720 feet. This indicates a progress at the rate of about seven feet per day. The work is progressing without interruption. By removing the intermediate accumulating pump, and bringing the power of the pump direct to the hydraulic jacks, the Beach pneumatic shield is advanced the width of one of the rings in eight minutes, a progress formerly requiring from two to four hours. Formerly, the great trouble was in getting the shield ahead; at present the great obstacle is in getting away the excavated dirt rapidly enough. A system of chutes is soon to be tried, one under each opening in the shield front, down which the dirt will slide direct into the waiting cars, instead of shoveling it by hand as heretofore. The company hopes to record ten feet per day when these changes are completed.

THE NICARAGUA CANAL.—It is reported that work has been commenced on the "most formidable piece of excavation" on the entire line of this work. The piece of work referred to is a cold rock cut about 13 miles from the Gulf terminus. A very large amount of dredging has already been done in the lowland between this point and the Gulf coast. Work on this great improvement will not be suffered to stop for a day on account of funds. If American capitalists do not come forward promptly with the money as fast as needed, English capitalists stand ready to take their place—a condition which neither our people nor our Government ought to allow to occur. It will be a burning shame and a circumstance which will afford endless international complications in the future if such a neglect should be permitted.

PROPOSED TOLL-ROAD IN ALASKA.—Alaska miners are interested in the matter of a proposed trail or toll-road from the head of Lynn canal to the headwaters of the Yukon, to afford a short-cut route for sending supplies into the interior.

TRIALS OF THREE LARGE STEAMERS show that propellers of small diameter have in each case proved the more economical and effective, both increasing the speed and reducing the coal consumption.

USEFUL INFORMATION.

Apparatus for Preventing Fires in Elevator Shafts.

Although elevators and their vertical shafts are a modern necessity not to be dispensed with, yet it is a well-known fact, based on abundant experience, that a fire in a lower compartment will lunge toward the elevator shaft by the nearest possible route, and reaching it, will go up with a howl, and in a very few minutes no fire department can stop its progress. A fire seems to be almost endowed with conscious intelligence by the way it reaches for the elevator shaft soon after it is started. This brings us to the problem, "How shall we maintain the elevator system and yet escape the disastrous possibilities that are a constant menace too frequently realized?" This problem has received the intelligent attention of a practical inventor, Abraham McLaughlin, of Pittsburgh, Pa., and has resulted in the production of a means, the mechanical features of which embody every requisite conducive to success. The leading feature of the invention consists in a hinged trap-door, that normally is turned vertically and stands close to the shaft wall, being retained by a trip arm catch that engages the top edge. This trip arm can be dispensed with, and the cord that lets the trap down may be made to retain it in an elevated position, the said cord being extended down to various accessible points, and may even extend into the office of the building. An open slot extends to the middle of the trap-door, in order that the rope will not interfere with its descent. The door is formed with an auxiliary bottom of sheet metal with an intervening space or chamber. Within this space is a V-shaped formation, the angle of which is presented outwardly for a purpose hereinafter understood. Closely contiguous to the shaft is a stand pipe for water having a short branch, so located as to lead to a point opposite the aforementioned V and the inturned nozzle. When the valve in the branch is opened, as it may be by pulling a cord which may extend to all parts of the building, it dashes the water to each side, where it escapes downward, through perforations about the edge of the bottom sheet, and thus drenches the walls of the shaft, tending to extinguish the fire besides retarding it. The water valve is preferably under independent control by a pull cord, and the door is under all ordinary circumstances entirely out of the way, remaining so perhaps for years, but ready at any critical moment to be closed, should flames break out. For so important an office this device is remarkably simple, and readily adapted to any elevator shaft already constructed.—*The Artisan*.

MARSTON'S WEIGHING FORK.—It is a good plan to be systematic in all things that are susceptible to system, and feeding stock is a feature which is eminently worthy of systematic methods. In this direction it would be well to have some ready device for weighing hay as it is fed out. Such a device is now offered in a "weighing fork," recently patented by N. B. Marston of Lebanon, N. H. The handle is in two sections, united by a hinge joint. A rigid arm or spur secured to the head section projects downwardly, and its tip joined to a compression coil spring, whose other end is secured to the handle section. Pivoted to the latter is a short arm, whose free end moves along a curved index bar that is marked with the scale graduations. The short end of the arm is connected by a small rod to the rigid arm of the head section. When a fork full of hay is picked up, the head section is depressed, assuming a somewhat angular relation to the handle section. This causes a compression of the spring and a movement of the index arm, just according to the weight of the hay, thus giving a very close approximation of the quantity. The advantage and convenience of this device is obvious, and it should come into very general use.

TO BENEFIT THE HORSES.—Next to perpetual motion, more time has been wasted by inventive cranks on an apparatus for helping horses to start heavy loads than on any other apparent impossibility; but a genius has at last got a starting spring to work, secured a patent, and produced a very striking working model. His plan is to fix a friction drum on each axle, attached to a lever in such a manner that when the horses begin to pull they exert their power on the axle and set the vehicle in motion very slowly. By the time it is really started, the play on the lever is exhausted and the hauling is done in the usual manner. For starting loaded street vehicles, the device seems perfect. Of course it is applicable to start cars or any other kind of road vehicles.

TIPPING CIGARS FOR IGNITION.—A druggist in St. Petersburg has invented a method of tipping cigars with a preparation so that they are lighted, like a match, by rubbing against any hard surface. A manufacturing company is said to have paid him 60,000 roubles for the patent.

IN BURNING COAL, a certain amount of air admitted to the furnace above the live coal is advantageous rather than otherwise, if the supply be regulated. The oxygen of the air, thus introduced, assists in the more effective combustion of the gases.

GOOD HEALTH.

Washing Out the Stomach.

During the past year, says the *Scientific American*, several physicians in New York have tried, with gratifying success, a novel treatment for dyspepsia and cancer of the stomach by washing out that organ. The process is very simple and not dangerous. A long, flexible pipe is passed down the throat until one end is in the stomach. The upper end has a funnel attached, into which hot water is poured until the stomach is filled. The weight of the water in the pipe and funnel gives a hydraulic pressure sufficient to distend the stomach. The pipe has an aperture big enough to hold a lead-pen. After the stomach has been filled, the funnel end of the pipe is turned down until it is lower than the bottom of the stomach, and the stomach is emptied as a barrel of any fluid is emptied through a siphon. The process may be repeated several times. The result is that the undigested food and mucus are washed out, and the hot water closes the blood-vessels and reduces inflammation. The relief is immediate. The dyspeptic may have his stomach washed out before a meal, so that he can take a fresh start. After the lapse of sufficient time for ordinary digestion, the stomach may be washed out again. This process has been in use at the New York Hospital, we are informed, for some time.

A physician of this city has been trying this washing-out process for cancer in the stomach, but without any success whatever. A cruel and useless blistering process was also employed. Between the two, the patient is well-nigh "used up," but she will get relief from unnecessary torment, if not from the cancer itself, by the mild treatment she is now receiving from our San Francisco cancer specialist.

CAR SICKNESS AND EYE STRAIN.—Considerable has been said of late in regard to "car sickness." A medical practitioner recently wrote in this connection as follows: I should like to call attention to car sickness in connection with eye strain. I have had eight or nine cases of this kind, all of which were relieved by glasses. One case was that of a gentleman who every journey had car sickness. While he had the mydriatic in his eyes he went to Washington and suffered no inconvenience whatever. Subsequently, after he had glasses, he made a trip to St. Paul without any of the former trouble. Recently I have had two cases—one that of a girl who could not ride a short distance in the street car without vomiting. I found a decided degree of hyperopic astigmatism. With the mydriatic in her eyes, she rode home without her usual trouble. A strange thing with reference to eye strain is that it often exists to an exceptional degree without showing any symptoms in the eye. The patient will often say that the eyes are perfectly good and have never caused any irritation. The reflexes seem to have settled in some other place. This is an interesting pathological and physiological question.

HOW TO ESCAPE MALARIA.—"You people who are afraid of malaria—and it is a good complaint to be afraid of—have some strange ideas about the disease," said a physician. "You think that if you climb a mountain and build there, or that if you live on the slope of a hill where the drainage is perfect, you are safe. Then coming on this, you sit around in the evening air with no covering on your head, or you sleep with a window so near the head of your bed that a current of damp air blows over you all night. Finest way in the world to catch malaria. Personally, I believe that if I had only two chances—one living in the center of a salt marsh and the other of living one mile from the edge of the marsh on sloping ground—I should take the marsh every time. I admit, however, that there are very many people who do not agree with this opinion. But to come back to our first proposition—cover your head when you are out of doors after dark, no matter how mild the air seems. Young girls who at summer resorts rush from a hot hall room to open verandas, take their lives in their hands. Most of them are so wildly reckless that it is a wonder they live through one season."

NO PUTREFACTION IN DEEP-SEA WATER.—Dr. Regnard has raised the question in one of the medical journals as to whether a corpse which sinks to a very great depth is preserved indefinitely or otherwise from putrefaction. According to his researches, which have been published at some length in the archives of the Biological Society of Paris, putrefaction is not found to take place in decomposable substances submitted to a pressure of 900 to 700 atmospheres; these figures corresponding to a depth of 9000 or 7000 meters at sea. From these experiments it must be concluded, according to Dr. Regnard, that there is a total absence of putrefaction in the greater depths of the sea.

CASTINGS UNDER PRESSURE.—The whole art of making castings under pressure needs to be more thoroughly studied. It is as yet only in its infancy. There is needed a casting machine which will do in iron and brass that which the type-casting machine does in type metal. Here is a chance for inventors.

Passing Events.

Extreme cold weather in the higher mountains has had an effect on mining operations in some localities. The water ditches became frozen and the mines of Grass Valley were without power for some days, throwing miners out of work.

In another column we print the remarks by the Governor of the State on hydraulic mining. It is notable that this is the first time in years that any official declaration in favor of the industry has been made, indicating a marked change in popular opinion on the subject.

The passage by the U. S. Senate of a simple bill providing for the free coinage of silver is the greatest victory the silver men have yet had. It is highly probable that the House will concur in this action, thus settling the long-contested question.

The latest dispatches indicate that there is no longer any fear of an Indian war and that the rebellious Sioux will submit to the plans of Gen. Miles.

Bullion Products of 1890.

The annual statement of the product of precious metals in the United States and Mexico for the year ending Dec. 31, 1890, has been prepared by John J. Valentine, vice-president and general manager of Wells, Fargo & Co.'s Express. The report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia) during 1890 shows, in the aggregate: Gold, \$32,156,916; silver, \$62,830,831; copper, \$20,569,092; lead, \$11,509,571; total gross result, \$127,166,410. The "commercial" value at which the several metals have been estimated is: Silver, \$1.04 per ounce; copper, 14 cents per pound, and lead, \$4.30 per hundred weight.

As in former reports, allowance must be made for probable variations from exact figures, by reason of constantly increasing facilities for transporting bullion, ores and base metals from the mines outside of the express, and the difficulty of getting entirely reliable data from private sources. Especially is such the case in the reports from Montana and Colorado. Statistics gathered in this way are liable to be exaggerated, but, with some modifications on this account, made herein, the final general results reached, while only approximately correct, may be accepted as the closest approximation possible under the circumstances. No bullion or coin was received by Wells, Fargo & Co.'s Express from the West Coast of Mexico during 1890.

The total product of gold dust and bullion, silver bullion and ores and base bullion received by express, freight and other conveyances during the year is as follows in the States and Territories named:

States and Territories.	Total
California.....	\$11,781,114
Nevada.....	9,240,538
Oregon.....	1,038,000
Washington.....	279,000
Alaska.....	762,811
Idaho.....	13,524,500
Montana.....	34,314,955
Utah.....	12,259,176
Colorado.....	27,275,447
New Mexico.....	4,535,067
Arizona.....	7,597,349
Dakota.....	3,045,560
Texas.....	249,423
British Columbia.....	361,555

Total.....\$127,166,410

The gross yield for 1890, segregated, is approximately as follows:

Gold, 26.29.....	\$32,156,916
Silver, 49.49.....	62,830,831
Copper, 16.17.....	20,569,092
Lead, 9.05.....	11,509,571
Total.....	\$127,166,410

The following table shows the total annual products of gold, silver, copper and lead, in the States and Territories west of the Missouri river, for the 21 years from 1870 to 1890, inclusive.

YEAR.	Product after deducting amounts from British Columbia and west coast of Mexico.	Product after deducting amounts from British Columbia and west coast of Mexico.	Product after deducting amounts from British Columbia and west coast of Mexico.	Product after deducting amounts from British Columbia and west coast of Mexico.
1870.....	\$2,296,659	\$60,361,634	\$2,200,000	\$19,934,429
1871.....	7,205,693	70,139,880	3,000,000	27,139,880
1872.....	12,205,693	70,139,880	3,000,000	27,139,880
1873.....	12,205,693	70,139,880	3,000,000	27,139,880
1874.....	12,205,693	70,139,880	3,000,000	27,139,880
1875.....	12,205,693	70,139,880	3,000,000	27,139,880
1876.....	12,205,693	70,139,880	3,000,000	27,139,880
1877.....	12,205,693	70,139,880	3,000,000	27,139,880
1878.....	12,205,693	70,139,880	3,000,000	27,139,880
1879.....	12,205,693	70,139,880	3,000,000	27,139,880
1880.....	12,205,693	70,139,880	3,000,000	27,139,880
1881.....	12,205,693	70,139,880	3,000,000	27,139,880
1882.....	12,205,693	70,139,880	3,000,000	27,139,880
1883.....	12,205,693	70,139,880	3,000,000	27,139,880
1884.....	12,205,693	70,139,880	3,000,000	27,139,880
1885.....	12,205,693	70,139,880	3,000,000	27,139,880
1886.....	12,205,693	70,139,880	3,000,000	27,139,880
1887.....	12,205,693	70,139,880	3,000,000	27,139,880
1888.....	12,205,693	70,139,880	3,000,000	27,139,880
1889.....	12,205,693	70,139,880	3,000,000	27,139,880
1890.....	12,205,693	70,139,880	3,000,000	27,139,880

The dividends paid by Colorado mining companies during 1890, and which were made public, were: The Aspen Mining and Smelting Co., \$200,000; Calliope, \$40,000; Little Chief, \$10,000; Little Rule, \$30,000; Matchless, \$100,000; May Mazappa, \$70,000; New Guston, \$367,500; Oro, \$95,000; Smell Hopes, \$25,000; Yankee Girl, \$245,000.

Precious-Metal Production.

In the tables of bullion product compiled by Wells, Fargo & Co.'s Express Co., which are recognized as being approximately correct, California takes the fifth place this year. But those States which lead her show their increase mainly in the direction of copper and lead, rather than in what are known generally as the precious metals. Montana, which is far ahead of others, makes her big figures largely from her copper values. Out of the \$34,314,955 credited to that State by Wells, Fargo & Co., the Anaconda copper mine alone (belonging largely to a San Francisco man) produced \$15,940,000, Colorado produced over \$5,000,000 worth of lead, Utah produced \$3,492,209 in silver and \$677,020 in gold, the balance of her product being lead and copper.

Now in California we produce very little lead, not very much silver and no very great amount of copper, though last week \$04,655 pounds of copper matte were shipped East from San Francisco. Most of our product is in reality a precious metal, gold, and if the hydraulic miners were permitted to work, this product would be about doubled.

The State of California in reality yielded a larger mineral product than is credited to it, but as it did not come in the form of "bullion"—base or otherwise—it does not appear in the tables referred to. Our product of quicksilver alone was worth about a million and a half, and no other State produces this. Then the borax, of which no other State except Nevada yields any, is of great value. Our mineral oils run up into the millions in value. The chrome ores shipped, the manganese, pyrites, and a dozen other products of the miners' work are not credited to the State in the returns, though the lead and copper of other States swell the value of their respective totals in mineral products.

California still leads all other States in its gold product, and such is the variety of its other mineral products, that were they all counted, the figures would doubtless exceed the value of those of the other States with the exception of Montana and Colorado.

Free Coinage.

On last Wednesday the bimetallicists in the U. S. Senate gained a signal victory in passing a purely free-coinage bill, which provides that the unit of value in the United States shall be the dollar, to be coined of standard silver 412½ grains or standard gold 25.8 grains. Although the debate on the silver bill and the votes recorded in favor of all amendments to the original bill indicated that a more liberal silver bill would be passed, yet there was nothing in the action of bimetallicists which could be accepted as liable to lead to the above gratifying result. The bill as passed will now go to the House of Representatives for action. Those who have made the subject a close study claim that the House will pass the bill as it came from the Senate. This belief is grounded upon private advices received from Washington, which claim that quite a number of Congressmen will sink their individual opinions and vote to remonetize silver in conformity with the views of their constituents as expressed by the congressional elections held last fall.

Silver Bullion Certificates.

The Stock and Bond Exchange of this city now intends following the custom of the New York Stock Exchange in listing "silver bullion certificates." The California Safe Deposit and Trust Company will store silver bars, not less than .997 fine or weighing over 1300 ounces, assayed by the United States Mint or the Selby Smelting and Lead Company, and will issue a "silver bullion certificate" for each bar, subject to a storage charge of two cents per 1000 ounces per day. By this means the public will have a chance to speculate according to their various financial and political views, and a "silver bullion certificate" will be collateral to our banks.

THE SILVER LAW TEST.—Secretary Windom has written to Merriok and Moore, the gentlemen who presented the silver brick at the Philadelphia Mint and demanded its coinage, that he can find no warrant in law for complying with their demand.

Accurate Surveys Not Necessary.

In making a mining location, it is not necessary to have a surveyor measure off the ground and adopt his description of the location, as if for patent proceedings. In fact, in the recent decision of White vs. Lee, the Supreme Court holds that locations made on such surveys do not comply with the law. The court says:

The men for whose information the boundaries are required to be marked wander over the mountains with a very small outfit. They do not take surveyors with them to ascertain where the section lines run, and ordinarily it will do them no good to be informed as to quarter-sections or magnetic variations. To say that a location thus made with reference to legal subdivisions is sufficient would, in our opinion, defeat the purposes of the requirement.

The proper mode to locate is to mark the claim in such a manner that any ordinary man, without engineering knowledge, can learn its boundaries from the notice and monuments. A few men in a district starting on the detail plan would compel every one else to employ a surveyor to assist in locating the claim. This decision is one of the very few from the courts which simplify regulations for the mining community.

Roadbed Construction in the Mountains.

The rough nature of the Alps, with their narrow, very sinuous and steep valleys, inclosed by precipices and high mountains, make the construction of railroads there very difficult. To avoid the snows of high altitudes, long summit tunnels had to be made. The Mont Cenis tunnel is 7.56 miles long, with 5250 feet of rock above it; the Gotthard tunnel is 9.3 miles long and the rock above it is 5650 feet high; the Arlberg tunnel is 6.35 miles long and the mountain over it is 2300 feet above the tunnel level.

On the Gotthard railroad, the valley slopes are in a continuous state of instability. During the winter months the ground is in a comparatively quiet state; it is covered with immense masses of snow and ice which come down into the main valley, sometimes as avalanches. The dangers of the geological and climatic conditions require a very careful location and construction of the road. Each case had to be studied separately and he treated individually; numerous viaducts and bridges had to be built; also galleries and strong archways to protect the road from slides and avalanches; aqueducts to lead torrential streams over the road; tunnels to avoid the dangers of avalanches and mountain slides.

The principles of construction of the roadbed of the St. Gotthard road are of interest to engineers on this coast where there is so much mountain railroading. The width of the single-track road-bed, measured on a level with the upper surface of the ties, is 13.8 feet in the mountain divisions and 13.1 in the valley divisions. The embankments, usually made of rocky material, have slopes of 1½:1; if no fertile earth was obtainable, the slopes were covered with a layer of head-land rocks two feet thick (see Figs. 7, 8a 8b and 9 of accompanying cuts). When steeper slopes were necessary, the slopes were made of rip-rap 1:1, up to a height of 65 feet (Fig. 10) and of dry masonry, with a slope of ¾:1; if the embankments were not higher than 33 feet (Fig. 11). Retaining walls of masonry in mortar were either built with an outer slope of 1.5:1 or vertical; if high, loose rocks were pecked in back of them (Figs. 12, 16, 18). Retaining walls with arches and buttresses where the foundation was difficult and the ground was solid only in isolated places. The buttresses having very little effect, as they do not protrude very far beyond the outer face of the wall, this kind of wall was abandoned and used but once near Arnsberg (Fig. 13).

Cuts were made with either 1:1 or 1.5:1 slopes (Figs. 8 and 9) or vertical in solid rock; in this case the lateral ditches were widened to protect the road from falling rocks. In regions of heavy snowfall, ditches from 6'-10' deep and wide were dug. Retaining walls in cuts are mostly built of masonry in mortar, rarely of dry masonry (Figs. 13, 14 and 15). Protection of the slopes against the river current was either obtained by pavement with a slope of 1.5:1, or by rip-rap with 1:1 slope. In front of these are loose stones piled up to high-water

DETAILS OF RAILROAD CONSTRUCTION IN MOUNTAINOUS REGIONS.

mark, and with a berm 6 feet wide. (Figs. 17 and 17^a.)

The tunnels on the valley divisions were built for one track; in the mountain divisions for two tracks. The portals of the tunnels are built in a very unpretentious manner; in loose, sliding ground they were strengthened by strong buttresses.

Culverts are mostly made of arches in masonry, their bottom having a continuous grade;

when very steep, the lower part is supported by heavy buttresses. (Figs. 20 and 20^a.)

Where avalanches and torrents had to be passed under, strong and capacious aqueducts were built. Viaducts were used to cross rivers and on steep slopes where sustaining walls would be too expensive; the arches vary from 26' to 40' span. Larger viaducts were built of iron girders with stone piers.

The iron bridges are of the usual European

construction. The track-ties are all oressoted. The rails are of steel, 74 pounds per yard. The gravel-bed is from 1.3' to 1.64' thick. The stations are from 3 to 5 miles apart. The rolling-stock consisted at the time of opening of the road to commerce of 61 locomotives, 127 passenger cars, lighted by gas, and 538 freight cars.

The road was built in several sections by different contractors, they being paid by the

unit of quantities. The bids were from 7 to 23 per cent below the company's estimate, and still all the contractors—except L. Favre of the great tunnel—made money.

The lumber-mills of Joseph Enright in Shasta county are to be connected with the California & Oregon Railroad at Anderson by a broad-line system, 16 miles long. He is in Sacramento buying rolling-stock.

VALUABLE BOOKS ON Painting, Varnishing, Etc.

A **Practical Treatise on the Fabrication of Volatile and Fat Varnishes, Lacquers, Siccatives and Sealing Waxes.** From the German of Erwin Andres, Manufacturer of Varnishes and Lacquers. With additions on the Manufacture and Application of Varnishes, Stains for Wood, Horn, Ivory, Bone and Leather. From the German of Dr. Emil Winkler and Louis E. Andes. Translated and edited by Wm. T. Braunt. Illustrated. In one volume. 346 pages, 12mo. Price \$2.50.

A **Complete Guide for Coach Painters.** Translated from the French of M. Arlot, Coach Painter, for 11 years foreman of painting to M. Eherler, Coachmaker, Paris. By A. A. Pesquet, Chemist and Engineer. With an appendix on the materials and the practice of Coach and Car Painting and Varnishing in the United States and Great Britain. 12mo. Price \$1.25.

A **Practical Treatise on the Manufacture of Colors for Painting.** Comprising the Origin, Definition and Classification of Colors; the Treatment of the Raw Material; the Best Formulas and the Newest Processes for the Preparation of every description of Pigment, and the necessary Apparatus and Directions for its Use; Driers; the Testing, Application and Qualities of Paints, etc. By M. Riffault, Vergnaud, Toussaint and M. F. Malepere. From the French by A. A. Pesquet. 89 engravings. Svo. Price \$7.50.

A **Practical Manual of House-Painting, Graining, Marbling and Sign Writing.** With Nine Colored Illustrations of Woods and Marbles, etc. By E. A. Davidson. 12mo. Price \$3. Painter, Gilder and Varnishers' Companion. Containing Rules and Regulations in everything relating to the Arts of Painting, Graining, Varnishing, Glaze-Staining, Graining, Marbling, Sign Writing, Gilding on Glass and Coach Painting and Varnishing; Tests for the Detection of Alterations in Oils, Colors, etc. Sixteenth edition, revised, with an appendix. Containing Chevreul's Principles of Harmony and Contrast of Colors, etc. 12mo. 356 pages. Price \$1.50.

Sign Writing and Glass-Engraving. A complete, practical Illustrated Manual of the Art. By James Callingham. 12mo. Price \$1.50.

The Painters' Encyclopedia. Containing Definitions of all important Words in the Art of Painting, with Details in Coach, Carriage, Railway Car, House, Sign and Ornamental Painting, including Graining, Marbling, Staining, Varnishing, Polishing, Lettering, Stenciling, Gilding, Bronzing, Scene Painting, Porcelain Painting, Plain Painting, Distemper Painting, etc. By F. B. Gardner. 158 Illustrations. Price \$2.

Everybody's Paint Book. A Complete Guide to the Art of Painting, Designed for the Use of those who wish to do their own work. Practical Lessons in Plain Painting, Varnishing, Polishing, Staining, Paper Hanging, Kalsomining, etc., as well as Directions for Renovating Furniture and Hints on Artistic Work for Home Decoration, together with a Description of the Tools and Materials Used; Directions for Mixing Paints, etc. 38 Illustrations. 12mo. Price \$1.

The Complete Carriage and Wagon Painter. A Compendium of the Art of Painting Carriages, Wagons and Sleighs, including Lettering, Scrolling, Ornamenting, Stripping, Varnishing and Coloring, with Recipes for Mixing Colors. 73 Illustrations. 12mo. Price \$1.

Practical Graining. With Description of Colors Employed and Tools Used. Illustrated by 47 Colored Plates, representing the Various Woods Used in Interior Finishing. By Wm. E. Wall, Grainer. Svo. Price \$2.50.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our new and revised Catalogue of Practical and Scientific Books, 81 pages, Svo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free of postage to any one in any part of the world who will furnish us with his address.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot Cut hurled and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

21 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

RIX & FIRTH,

225 and 227 First St., San Francisco, Cal.

Compressed Air and Water Power Machinery.

KNIGHT'S WATER WHEEL,

For Mills, Pumping and Hoisting.

OVER 300 IN USE.

All estimates guaranteed. Send for Circular.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths. **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

(ESTABLISHED IN 1855.)

Office, 213 Fremont St.,

San Francisco.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

TUSTIN'S PULVERIZER.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and **GELATINE-DYNAMITE,** Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare chemicals made to order. Instructions given in Assaying and Practical Chemistry.

RIFE'S HYDRAULIC ENGINE (or Ram)
PATENTED FEB. 8, 1887.
For Supplying Water to Small Towns, Factories, Steam Mills, Dairies, Stock Yards, Residences, etc., and for Irrigation, Railroad Tanks, Etc.
Constructed upon a new and improved principle greatly increasing the capacity and avoiding extreme concussion that has heretofore proved destructive to all common Hydraulic Rams, making this ESPECIALLY adapted to Railroad water supply and irrigation.
FOR INFORMATION ON IRRIGATION, ADDRESS
D. B. HAYS,
OROVILLE, Butte County, California
Write for Illustrated Catalogue.
Rife's Hydraulic Engine Manufacturing Company.
CAPITAL STOCK, \$50,000.
W. A. RIFE, President. B. L. GREIDER, Sec. and Treas.
ROANOKE, VA.

THOMAS PRICE & SON,
Assay Office, Chemical Laboratory,
BULLION ROOMS and ORE FLOORS,
524 Sacramento Street, San Francisco, Cal.
COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.
WORKING TESTS OF ORES BY ALL PROCESSES.
SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.
Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY SMELTING and LEAD CO.,

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.

ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Moulds, Crucibles, Scoffers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents for the Morgan Crucible Co., Battersea, England. Also for E. G. Dennison's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analysis of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations Miners; Plans and Reports furnished.
C. A. LUCKHARDT & CO.,
(Formerly Buhn & Luckhardt,
Mining Engineers and Metallurgists.

TRAFTON'S Gold Saving Device.

Patented June 17, 1890.

A NEW DEVICE TO BE USED ON TABLES FOR Gravel Mills and Undercurrents to Hydraulic Claims. When used in quartz mills it is equal to silvered plates. It is simple and economical in its construction and practical in its operation. Send for circulars.
CHAS. TRAFTON,
Yankee Jim's, Cal.

The Best Mining District On the Pacific Coast! GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is **THE TIDINGS.**
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, \$6.00 a year; WEEKLY, \$2.50, in advance.
H. S. SPAULDING, Publisher.
T. C. ROCKINO, Editor.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap, do us the favor of returning it again.

List of U. S. Patents for Pacific Coast Inventors.

The following brief list by telegraph, for Jan. 14 will appear more complete on receipt of mail advice:

* California—Clarence V. Greenaway, bench clamp for pipe tongs and wrenches; also, adjustable pipe wrench; Lionel Heynemann, cable street railway; Peter S. Jackson, lengthening metallic beams; Jose Jardino, clearing apparatus; Edward G. King, compass attachment for field glasses; Edward M. Knight, titer; Patrick Noble, cable, railway; George A. Williams, coffee-pot; all of San Francisco, Daniel B. Baker, sash, San Jacinto; Dan Carl M. Baldwin, seedling machine, Florence; Louis P. Carl, tether pin, Peris; Alfred Dugden, knife sharpener, Santa Barbara; Willis D. Etzel, train fare punch, San Jose; John J. Cozer, whitetree coupler, Los Angeles; James Lyman, globe, San Jose; James R. Phelps, spreader for galting horses, Sacramento.

Oregon—Horace T. Currie, rail-cleaning and lubricating attachment for locomotive, Albina; Albert M. Grubbs, railway switch, Forest Grove.

Washington—David H. McFall, carpet-stretcher, Ellensburg.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLY-BOOKS.—John S. Beno, S. F. No. 444,272. Dated Jan. 6, 1891. Ordinary fly-books for carrying the artificial flies, used by fishermen, are composed of leaves of parchment and of flannel. The parchment leaves are usually arranged with two or more transverse pockets into which the looped ends of the snells or guts of the fly-books are tucked so as to keep them in place, or else the fly-books themselves are tucked in these pockets, leaving the gut ends projecting. In one case the patterns of the flies are concealed and the hooks have to be withdrawn for examination, and in the other case, where the hooks project, they are apt to become entangled. These fly-books are also often provided with ordinary parchment envelopes with a single flap bound in as leaves. Other forms of books are made, most of them more or less bulky, since to carry any considerable number of artificial flies, a large number of leaves must be used. Mr. Beno's new book has removable pocketed leaves or envelopes of peculiar construction so fitted in as to be readily examined and opened. The varieties of flies are readily accessible, while at the same time a large number can be carried in a small space. Each variety can be kept separate in its separate receptacle, and by indexing and numbering only the envelope desired need be opened and examined. In this case a book, a gross of flies, may be carried in small compass, each variety by itself, with no liability of being mixed. A rubber or strap lifts up the whole bunch of envelopes for examination, when the selection desired can be made. Many of our local anglers pronounce this book of Mr. Beno's the most convenient one on the market.

DERRICK.—Doctor F. Oliver, Oakland, No. 444,367. Dated Jan. 6, 1891. This hay-stacking derrick is a simple and well-balanced device adapted to be readily transported, and which, by reason of its peculiar boom, is adapted to deposit the load upon any part of the stack desired.

SCREEN.—Alexander A. Palm, Calico, San Bernardino Co., Cal. No. 444,252. Dated Jan. 6, 1891. This is a screen for coal or ore, of the kind generally known as a grizzly. The relative arrangement of the bars is peculiar, and is such that a piece of material coming down the bar of an upper section will find the opening in the next section directly in its path, so there is no danger of a piece that can be screened passing down upon the bars the whole length of the grizzly. The bars are tapered, so the spaces between them are wider at the lower ends than the upper, which avoids clogging or wedging and insures proper discharge. This result is further insured by the tapering shape in cross-section of the bars.

Coal and Coke.

SPOT FROM YARD—PER TON.	TO LOAD—PER TON.
Wellington.....\$12 00	Australian.....\$7 75
Greta.....	Liverpool Stm.....8 00

Coke—English.

Eastern Metal Markets.

By Telegraph.

New York, January 14.—The following are the closing prices the past week:

	Silver in Silver	Lead	Tin.
Thursday.....	48 1/2	14 00	4 00
Friday.....	48 1/2	14 00	4 00
Saturday.....	48 1/2	14 00	4 00
Sunday.....	48 1/2	14 00	4 00
Monday.....	48 1/2	14 00	4 00
Tuesday.....	48 1/2	14 00	4 00
Wednesday.....	48 1/2	14 00	4 00

Borax is slightly easier. Lead has been steadily advancing under a firmer demand. Copper shows a steadier tone. Tin fluctuates slightly. The demand is slow.

MINING DECISION.—The Register and Resolver at Reading have decided the cases of the Santa Rosa Quartz Mine and the Grand Central Quartz Mine vs. The State of California in favor of the mines and against the State. The mines are situated in Sec. 16, T. 31 N., R. 6 W., Shasta county, near Igo. The Black Prince mine is situated in the same section. E. A. Belcher, the mining attorney of San Francisco, represented the mineral claimants. The State is allowed 30 days to appeal to the Commissioner of the General Land Office.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 15, 1891.

The general situation among manufacturers and merchants is about as heretofore reported. Crop prospects are of the best. The only drawback to the favorable condition of affairs is the light deposit of snow on the mountain ranges; but there is ample time for a large fall before the rainy season has passed. The local money market is steadily growing easier.

MEXICAN DOLLARS.—The market is quiet but from firm 82 1/2 to 83 cts.

SILVER.—Department purchases in this month are as follows:

Date	Offered ounces.	Purchased ounces.	Price paid per ounce.
January 2.....	932,000	807,000	\$1.0450 to \$1.0525
January 6.....	1,330,500	672,000	1.0550 to 1.0480
January 7.....	1,350,000	625,000	1.0492 to 1.0529
January 9.....	1,020,000	754,000	1.0510 to 1.0524
January 12.....	593,800	283,000	1.0525 to 1.0700
January 14.....	918,000	455,000	1.0585 to 1.0620
Total.....		3,499,000	

With only half of the month passed, nearly the full quota of silver required to be purchased has been secured. The market has exhibited more life at the East, which is accepted by operators as indicating that speculators are at work. The annual report of Wells, Fargo & Co. gives the output on this coast at over 2,000,000 ounces less in 1890 than it was in 1889. The San Francisco Stock and Bond Exchange has listed silver bullion as a speculative commodity, to be dealt in the same way as are other securities listed by the Exchange. The passing by the United States Senate of a pure, unadulterated free-coinage bill has not, as yet, had any effect on the market. This, no doubt, is due to fears entertained that the House of Representatives will not accept the Senate bill. It may be that the growing fear of free coinage has possibly had the effect to convert a sufficient number of gold-bug Congressmen to bimetallicism to give the latter a majority in the House.

QUICKSILVER.—Receipts the past week aggregate 223 flasks. The market has sunk to still lower figures. The demand is good for the season.

ANTIMONY.—The market is barely steady. The East reports an easy tone.

BORAX.—Receipts the past week aggregate 223 casks. The market is quiet but steady. Eastern advices indicate a better consumptive demand in the near future.

LIME.—Receipts aggregate 2950 bbls. The demand is only fair.

IRON.—The market is quiet but steady. English advices report a stronger tone. At the East it is claimed that concessions are easier to get from first hands. This is said to be due to large producers crowding the smaller concerns into suspension. The Alabama furnaces are likely to go out of blast in the near future, which if done will lessen production fully 120,000 tons a month.

COPPER.—A shipment of 804,665 lbs. of matte was made the past week to New York. The market is barely steady. The Eastern markets report buyers and sellers somewhat apart. Arizona ingots are obtainable as low as 13 1/2 to 13 3/4 cts., and casting brands at 12 1/2 cts.

TIN.—The market is barely steady for pig. Plate is firm, with a fair inquiry. In New York, plate is higher and active. English cables, report a strong active market for plate for the United States, anticipating the duty which goes into effect on July 1st.

COAL.—Imports the past week aggregate as follows: Seattle, 2907 tons; Coos Bay, 1575; Nanaimo, 3678; Departure Bay, 1227. Total, 119,387 tons. The market is easy for coast. It is claimed that Seattle is obtainable at \$8, but this, too, fails to have confirmation. Dealers buy sparingly, under the impression that lower prices will obtain soon. With continued good crop prospects on this coast, more tonnage will head this way.

San Francisco Metal Market.

Mining Share Market.

Minio shares the past week were quite active at fluctuating but upward prices. The moves are different from those made in former manipulations, which give color to a well-grounded belief that a new general is at the helm. The changes in the personnel of those who do the outward work have been so quiet as to not attract undue notice from the few remaining outside dealers willing to be bled. The action of the market warrants the assertion that prices will go still higher, so as to peddle out stocks probably for assessment purposes. As yet the outside public is not over-sanguine, and when it buys it is generally for a "chip." Until manipulators get the confidence of the outsiders, so as to get them loaded up, we can continue to look for an active trading market. They may even resort to the old dodge of showing up ore in one of the mines so as to induce outsiders to buy stocks. The conditions are favorable for unloading at a good profit. The work in the mines is of a very important character and almost entirely prospecting. There is every indication that silver will be remonetized by the present Congress, while the money markets of the world are easing up, and with cheaper money, speculations are fostered.

Since the second day of the present month, Con. Virginia and Gould and Curry more than doubled in price, although at the close they have receded from their highest figures. Other stocks also sold at higher figures. By reference to the highest and lowest prices for the week, this can be verified. Our list is compiled from the official sales of the Board published by Goldstein & Co.

It is reported in usually well-informed stock circles that there has been some crooked work in the management of one or more of the Gold Hill mines. Those who place credence in the report say that the books and accounts in the offices are honestly kept, but it is at the mines and mills where the leaks are claimed to be done. Why do not the companies conform to the laws of this State and give the lie to these reports, provided the mines are honestly worked, and the ore honestly mined?

News from the Comstock mines is that the strike in Gould and Curry is likely to prove more valuable than was at first supposed by well-informed miners. The strike in Con. Virginia on the 1600-foot level "way to the west" is of an important character, and when further developed it is likely that the battery assays of ore milled will show a decided increase. In Savage, Hale and Norcross and Chollar, favorable results are confidently looked for from the active prospecting work now under way. In the Potosi workings another improvement is reported toward the Bullion line. Our advices from the Gold Hill mines report important work, which is not even hinted at in official letters from the superintendents. Whether private letters to officials in this city contain the information, we are not able to learn. In Con. Imperial, Confidence and Challenge, high-grade ore is being taken out or laid to one side for future milling. This is probably done in order to give a more plausible excuse for assessing the stock. In Belcher, Seg. Belcher, Overman, Crown Point and Yellow Jacket, the work is being watched with deserved interest by the more prominent mining men. From the outside mines, the news is confirmatory of what we have heretofore given. Confidence is expressed that the spring months will witness a very general revival in all outside districts.

The market opened this morning to lower figures, but strengthened slightly after Call under an up move in Savage. News received to-day reports continued improvement in the Savage winze, and that in an east drift run from the winze they were in rich ore. This indicates a large development in the mine. From Hale and Norcross, private information is also of an important character.

At the annual meeting of the Mining Stock Association the following officers were elected to serve for the incoming year: Dr. W. H. Griswold, president; Major Frank Mann, vice-president; John Tingman, secretary; Col. Dean, treasurer. The attendance was large, and considerable enthusiasm was manifested at the prospective changes in mine managements for the better.

THE output of the Roslyn mine of Kittitas county, Wash., for 1890 was 450,669 tons, against 238,431 tons in 1889. The payrolls for many months called for \$80,000 a month.

- One (1) Amalgam Barrel.
- One (1) Batea.
- Three (3) Frue Concentrators.
- One (1) 10" x 18" Slide Valve Engine.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of December, 1890, an assessment, No. 21, of Three (3) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 33 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. BARROWS, Secretary pro tem.
Office, Room 11, No. 303, California Street, San Francisco, California.

INYO MARBLE COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Keeler, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 16th day of December, 1890, an assessment (No. 1), of Ten Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 132 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
G. W. LUCE, Secretary.

CHEMIST.

Young man who is a competent mineralogist, assayer and analytical chemist is open to an engagement; best references; can furnish small capital. Address CHEMIST, this office.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DIVIDEND NOTICE.

For the half-year ending December 31, 1890, a dividend has been declared at the rate of five and forty-hundredths (5 40/100) per cent per annum on Term Deposits, and four and one-half (4½) per cent per annum on Ordinary Deposits. Payable on and after FRIDAY, January 2, 1891. GEO. TOURNEY, Secretary.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "unusually popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Ores; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ores Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Copel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Table.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth, 1889. Price, \$1, postpaid. Sold by Dewey & Co., Publishers, No. 220 Market street, S. Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Particulate Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by Dewey & Co., Publishers, No. 220 Market St., S. F.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

The Pittsburgh Boiler Scale Resolvent.

THIS Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & Co., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK, Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad.

Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

SAN FRANCISCO, SATURDAY, JANUARY 24, 1891.

Three Dollars per Annum.
SINGLE COPIES, 10 CENTS.

The Boston & Montana Co.

(Written for the Press by R. G. HUSTON.)

This company is the result of a consolidation of the Mountain Copper Company's properties with those of Chas. X. Larrabee, the owner of the Mountain View mine. Since this reorganization they have acquired new properties and developed old ones until they have become one of the strongest companies operating in Butte, and will in time prove a rival of the Anaconda. Their properties at the time of the consolidation consisted of the Mountain View and East Colusa and one or two others of but little note.

Since that time they have acquired by purchase the Harris and Lloyd tunnel properties, consisting of three full claims, and the West Colusa and the Clarke smelter, all desirable property and lying contiguous to their properties. Explorations have been carried on with such vim and energy that they at the present time have many years' supply of ore in sight for a much larger plant than they are now operating. The Mountain View shaft is 1000 feet in depth, with stations at each 100 feet, crosscuts and levels run, opening up the ore body.

The Colusa is 800 feet, West Colusa 500 feet, Lloyd & Harris 400 feet in depth. With all of these properties opened and all of the preparatory work done, the company are in a fine position to keep the shipments of copper matte up to their present proportions for many years. They are at present building smelting works at Great Falls capable of handling 1000 tons daily, and have their contracts made with the Great Northern railway to transport that amount for them. When this is completed, it will increase their output very largely, as at the present time their reduction facilities will only handle about 450 tons daily. Their works at Great Falls bring them convenient to the Land Conlee coal-fields, and their power costs them comparatively nothing. This will more than stand off the expense of transportation,

and in building the new reduction works every advantage that can be taken to reduce the cost of handling will be used. When complete, the Boston & Montana Company's smelter at Great Falls will be a model of convenience for the production of copper matte; it will increase their product to about 75,000,000 pounds of refined copper per annum, and their silver to the value of 1,000,000 ounces.

This estimate is based on the statement from the company's books of the product for the three years previous to June 30, '90, which were as follows:

	Refined Copper.	Oz. Silver.
Product for year ending June 30, 1888.....	8,815,987	None.
Product for year ending June 30, 1889.....	24,204,844	152,993
Product for year ending June 30, 1890.....	26,014,120	284,542

Taking this for a basis and the present price of silver and copper, when their plant at Great Falls is completed and in operation, the B. & M. Company's yearly product will approximate \$10,000,000. This may have the appearance of applying the old adage of "counting chickens before they are hatched," but the only chances to be taken in this estimate are the ruling prices of the red and white metals.

The shafts on all of their properties are furnished with the finest engines and hoists that have been erected in the camp, and are of sufficient size to sink to the 2000-foot level should that ever become a necessity.

One of the best indications that a mine is being operated with a handsome profit is to see their hoisting works and shaft-houses (see engravings) in complete order and all the safety appliances that can be obtained in place.

The employees of the Boston & Montana Co. number nearly 1000 men in mines and reduction works, and as nearly all live in the vicinity of Meaderville, they make a happy, contented community.

Among their number they have the finest band in the State of Montana—all miners working with the company. It is known as the Boston and Montana Band.

The superintendent, Thos. Couch, made them a present of a fine large hospital building, amply large for all demands likely to be made upon it. This is kept up by the usual hospital tax of one dollar per month deducted from each employe, and a guarantee of care and comfortable quarters when, through sickness or accident, they may require it. The officers of the company are at present: President, Jos. W. Clarke, of Boston; Secretary and Treasurer, Albert S. Bigelow; General Manager, Thos. Couch, of Butte; and the smooth manner the B. & M. Co.'s works are carried along is due to their careful direction of affairs.

Thomas Couch, the general manager, on

New Mexican Mines.

EDITORS PRESS:—I have sent you no report from this camp for a long time, because there was nothing of special moment to report. With the closing weeks of the old year, however, the camp has taken a new start and is now progressing very rapidly indeed.

In November, Wm. Watson, one of the owners of the property known as the "Old Abe," made discovery of the lead. Mr. Watson had worked upon the property for more than ten years. Many discoveries of rich ore had been made, but in none was there any important lead or any paying quantity of ore. Finally upon a grassy slope, near the "Old Abe" gulch, right under the grass roots, he came upon the apex of the true fissure quartz vein for which he looked in vain so many years. At the surface it was about 18 inches wide. Mr. Watson instantly commenced sinking. The lead steadily increased in width and promise. At a depth of 35 feet it had put 50 tons of ore on the dump, and the owners leased the Glass 10-stamp mill east of town. The trial run cleaned up about 46 tons of rock which contained some surface dirt and water. The result was \$33.50 per ton. The mill started immediately after the cleanup on regular crushing work for an indefinite period. At 80 feet of depth the lead shows five feet of fine quartz ore, at least as rich as the first millrun, and produces ore at least as fast as the old mill can crush it. The lead has now been traced several hundred feet, apparently maintains its value so far as traced, and another permanent producer has undoubtedly been added to the old resources of the camp. The property is under the personal management of the owners and will be worked for what there is in it and for all it is worth. Better still, a large majority of the ownership is in the camp, and the profits will consequently stay here for investment.

In November, B. H. Dye, co-owner of the Lady Godiva, resumed work upon the 450 level, drifting north on the No. 1 vein. On Christmas eve he struck the south edge of the great ore chute which is known to extend to the surface. The ore is a very rich black-and-white quartz, of which there is now between three and four feet. Milling operations upon this ore body will begin shortly, and still another permanent producer will result from Dye's persistent work.

Both of these new producers lie upon "East Baxter" mountain. The ores of this section of the mountain are quartz and the ores are found in fissure veins and are of exceptionally high grade. The ores of West Baxter are usually porphyritic or granitoid, can hardly be called "veins," and are of much lower average grade.

The North Homestake, for the past four years the property of James M. Sigafrio et al of Tarrytown, N. Y., has been worked in a small way to supply a mill of two five-foot Huntington centrifugal machines.

There has been a slow but steady development until the Solitaire shaft on the property has attained a depth of 960 feet. (By the way, by several hundred feet the deepest work in New Mexico.) At that depth 30,000 tons of ore are in sight upon a very conservative estimate. Upon this showing the property has been sold to Chicago and New Mexican parties for \$250,000. The purchasers will take possession, it is understood, on the 15th inst. The purchase was negotiated by John A. Miller, Esq., of Silver City, N. M., well known in the mining world on account of his successful operations at Lake Valley, Pinos Altos, Cooney, Carlisle and elsewhere. Mr. Miller is personally interested in the purchase, and will, it is understood, be for a time at least the manager of the property.

Mr. Miller is a man of wide experience in New Mexican mining, having been a resident of the Territory for 25 years. He is of abundant energy and push, and I risk nothing in saying that the North Homestake property under his management will be worked for all it is worth. The purchasers contemplate very large additions to the equipment of the mine; the use of a much larger compressor plant than that now in use; a new mill equal to at least a hundred tons a day, and other additions to their facilities for the rapid extraction and economical treatment of their ores.

All these developments have energized the camp (very dull for the past two years) and the good effects are already perceptible.

Developments proceed in the Jicarilla camp, eight miles north of us, with very promising results. That camp cannot, however, prosper until the introduction of capital. Rola Wells is at work upon his Helen Roe mine in Nogal district, 20 miles south. From the level being run each way from the 140-foot shaft at a depth of 50 feet, nothing but ore is taken out, and that of a very high grade.

Near Tres Rios, 35 miles south of us, very rich silver ore has been found upon the Mesalero Apache reservation, on which considerable quiet work is being done. Petitions for the reduction of the reservation by the two townships involved in the new mining discoveries, have been sent on to Washington. The

application will probably be successful, as they will meet with no opposition from this domestic and thoroughly peaceable tribe of Indians. The Mesaleros make no use of the portion of the reservation desired for mining purposes, and care for no parts of the reserve except those used by them in farming and for the grazing of their cattle. In fact, the most influential portion of this tribe desire to obtain lands in severalty, abandon the reservation system, and thus insure their own permanence in the country in which they reside and which has become dear to them. The year 1891 will, I have no doubt, develop in the Tres Rios region a valuable silver camp, to the great benefit of the surrounding country. The silver ores so far exposed in the new camp are of a grade which will stand the necessary wagon transportation of 100 miles to railroad.

White Oaks, N. M., Jan. 10, 1891.

Mines Around Daggett.

EDITORS PRESS:—We are having cold raw winds but no snow in this vicinity. Recently one-third interest was sold for \$5000 in the McShane mine to the Barber Milling Co. of Calico. A claim on Stockton hill, near Kingman, has also been sold to Robert Whiteside of Los Angeles for \$9000. Some mines down here are progressing in development more than ever before, especially those accessible to railroads. We have, however, little confidence in tenderfoot speculators who will not risk more than \$500 to test a mine. They prefer cheap claims and seem to want such as can be handled in the Stock Boards. We would like to see some bona fide mining investors in this part of the country who will pay for a good mine when they see it.

S. P. BLADE.
Daggett, San Bernardino Co.

Coast Coals.

J. W. Harrison furnishes the following review of the local coal market for the past year:

This has proved a very profitable year to all engaged in this trade, especially to the owners of the coast collieries, as the ruling figures for the past six months have left them a very handsome margin over the cost of production. To evidence how marked have been the fluctuations during the year, spot cargoes of Australian coal changed hands in January last at \$6.75 per ton, some cargoes of a similar grade were sold last month at \$11.50 per ton, and only a limited quantity was procurable at that figure. These exceptionally high figures were not the result of any combination or trust among the dealers—simply the demands exceeded the supplies. From May 15th to September 10th no coal was shipped from the Wellington mine, and from August 25th to November 10th no cargoes were loaded in Australia. With these two principal sources of supply cut off, and at a season of the year when most in demand, the increase of values can be readily explained. The labor troubles having been amicably settled, shipments are now coming forward freely and values are declining, English and Australian cargoes being offered at lower rates for future delivery.

The following table of prices will show the monthly fluctuations of foreign coals for "spot" cargoes—the average price being given for each month:

	Australian	English	Scottish	West
	Gas.	Steam.	Flint.	Harley.
January.....	\$6.75	\$8.00	\$8.50	\$9.00
February.....	6.75	7.75	7.75	8.50
March.....	7.12	7.62	8.00	8.50
April.....	7.50	7.75	8.00	8.50
May.....	7.50	7.75	8.00	8.50
June.....	7.62	7.75	8.00	8.50
July.....	7.85	8.00	8.25	8.50
August.....	8.50	8.87	8.75	9.00
September.....	9.00	9.25	9.50	9.75
October.....	10.00	10.00	10.50	11.00
November.....	11.50	11.25	11.50	11.75
December.....	11.00	10.50	10.50	11.00

The various sources from which we have derived our supplies are as follows:

	1889.	1890.
British Columbia, tons.....	417,904	440,571
Australia.....	408,722	194,726
English and Welsh.....	32,890	33,145
Scottish.....	12,727	1,010
Eastern (Cumberland and Anthracite).....	18,950	31,950
Franklin, Green River and Cedar River.....	209,137	216,760
Carb n Hill and South Prairie.....	103,377	191,109
Mount Diablo and Coos Bay.....	57,000	74,226
Japan.....	1,340	13,170
Totals.....	1,351,957	1,197,250

To insure a correct statement of the consumption of the State, I have included all the arrivals at San Pedro, 70,954 tons, and San Diego, 52,358 tons.

As the freight from foreign ports is the principal factor in establishing coal values, it is a query how our market will shape itself in 1891. A seasonable rainfall, producing bountiful crops, assures us a large influx of vessels that will be principally coal-carriers. This, of course, signifies low-priced fuel, but the season is not sufficiently advanced as yet to hazard an opinion. Notwithstanding we are now receiving 75 per cent of our coal from our coast mines, the local agents of the northern collieries regulate their prices by the import cost of foreign grades.

The imports of foreign coals for the year amount to 18,309 tons, as against 21,624 tons last year.

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XXVI.

(Written for the PRESS by JAMES H. CROSEMAN.)

Iron Mountain.

About ten miles in a southeasterly direction from Crystal Salt, an elevated mountain peak may be seen, the length of which is 12 miles and the width four. The formation is dolomite and porphyry. The name Iron Mountain was suggested by the deep red iron oxides which stain it, forming an iron hat of considerable extent, which can be plainly seen from a long distance. This forms the gossan or cap of a vein of copper ore of evident value, the ores carrying on an average about 38 per cent copper, 20 ounces silver and \$75 gold.

Chuckawalla Springs

Are eight miles distant from Iron Mountain in a northwesterly direction, and about 50 miles east of Salton, a station on the Southern Pacific railway in the desert regions. These springs are located in San Diego county, not far from the line of San Bernardino county. In their vicinity is an important mineral district in which lead-silver ores and gold-bearing rocks occur in strong, well-defined veins.

Assaya from the Nonpareil, one of the principal and most promising mines, give 50 per cent lead, 20 ounces silver and \$75 gold per ton. The vein, which is a contact between porphyry and lime, is about four feet in width.

The foothills of the Colorado river range have long been known to contain strong veins of copper ore of high grade. Leaving the eastern and northeastern portion of San Bernardino county, we enter the desert region in the vicinity of

Soda Lake.

A brief description of this interesting region cannot fail to be of interest. There is a tradition among the Pute Indians to the effect that during the time of their forefathers, what is now Soda Lake was at that time a vast sheet of water 20 miles long and 8 wide, which must have been fresh, as the legend says the waters teemed with fish. It is situated 500 feet above the level of the sea. There are times when this great natural reservoir is filled to the brim, particularly when heavy cloudbursts occur on the slopes of the neighboring mountains, and the waters rush in torrents down into the basin. Then the antebarricade channel or outlet is flushed and found too small to carry off the flood. So great is the pressure that the lake-bed becomes a veritable geyser, spouting mud and water violently. On the southwest side of the lake is a considerable area covered by sand-dunes, which region has been named in grim humor, the Devil's Playground or Hell's Half Acre. During the windstorms which frequent this section, millions of tons of sand are shifted in a great circle about 12 miles in diameter from one side of the lake to the other, the central portion of the area remaining seemingly undisturbed, covered by a snowy white crystallization of soda.

Along the west side of the lake for a distance of four miles, occur springs of pure water which flow down to the lake's margin, where the greedy sands allow up the streams. The largest spring flows from a fissure in the solid lime limestone which forms the bedrock of the region. The water from this spring flows about 18 miles before it is lost in the desert and. There are numerous other springs on the south-east side of the lake.

Soda Lake station is situated about 75 miles east of Daggett on the line of the old emigrant road from Salt Lake. Its mean temperature is about 80 degrees. To the northward, a deep, rugged canyon has been cut down into the limestone. Passing through this canyon we come to another dry basin, known as Crystal Lake. In its area is 60 miles, 12 long by 5 wide. This basin is filled at times, though rarely, by the overflow from the Mojave river.

Making our way through another pass for a distance of 12 miles, we reach the confluence of the Mojave and Amargosa rivers, where a spur of the Ivantuz mountains forms one of the river banks. On the westerly slope of this range occur the salt spring and Amargosa mine, which were discovered by John A. Golden in 1849, while on his way from St. Louis, Mo., with an emigrant train. It was this same train which divided at King's Springs in Nevada. It was from this circumstance that the sensational stories arose which have recently been published giving lengthy descriptions of the terrible sufferings and ultimate death of a hundred or more men, women and children in Death valley while endeavoring to cross the desert. The loss of life, though not near as great as reported, occurred with that portion of the train which Mr. Golden left. After leaving the main train in Nevada, he started with his own outfit for Los Angeles, California. Traveling down the Amargosa river, he camped one day at Salt Spring, and it was while here that he made his way up the mountain-side and found a piece of heavy black mineral. Not being familiar with it, but thinking it might possibly have value, he took it with him to camp, eventually taking it to Los Angeles, where he showed it to a number of gentlemen, who at once unhesitatingly pronounced it gold, covered with a black oxide of iron. He was offered \$5000 to guide a party to his discovery, to

which he consented, though it was with the distinct understanding that should he fail to show them his treasure-trove, or in the event of his becoming lost on the desert, his life should pay the forfeit. Mr. Golden readily consented, for he had every confidence in being able to guide his party directly to the spot.

A party was promptly formed and left Los Angeles to face the dangers of a reported unknown and terrible desert in search of the golden treasure. The hardy pioneer had no difficulty in finding Salt Springs, and went into camp at that place in high spirits; but his satisfaction at having reached his journey's end was soon turned to consternation when he was unable to find the place at which he had discovered the gold. He tried to keep the dreadful fact from his companions for a time, but they were after gold, and soon became so importunate that he was obliged to confess his inability to find the place again, though the while earnestly protesting his good faith. His companions felt themselves duped, and angrily recalled the unfortunate man to the terms of the contract, coolly informing him that if he had any prayers to say it was time to commence.

In an agony of despair, though believing the place must be near, he sank on the ground and buried his face in his hands. One of the party approached and stood glaring at him, when casually glancing on the ground at the doomed man's feet, he saw a piece of mineral similar to that exhibited by Mr. Golden in Los Angeles. The mine was located, the party then returning to Los Angeles, where Mr. Golden was paid his \$5000. A corporation known as the Salt Springs Mining Company was formed, and in 1852 a five-stamp mill was erected and kept in operation continuously during the following winter seasons until January, 1864, at which time the Pute Indians, who were on the warpath, massacred every one at the mine, burned the mill and sacked the camp.

After the burning of the mill, Mexicans secured leases on the property and worked the ore in arrastras, realizing, it is said, fabulous sums.

Undoubtedly the mine was of a pookety character, as it was afterward abandoned for years and relocated a number of times. In 1880, under the management of C. A. Luckhardt of San Francisco, the concern was reorganized and listed on the New York Stock Exchange, where the stock sold as high as \$15 a share. But little work of development was done at the mine and the entire scheme soon fell through, the mine finally becoming the property of J. B. Osborne of Daggett, the present owner.

The water of Salt Springs contains about the same percentage of chloride of sodium as that of the sea. The altitude is 800 feet above sea level, and it is situated about 60 miles directly northeast of Daggett. At 1 p. m. May 2, 1890, the temperature was 88 degrees in the shade.

The many stories of fabulous discoveries in the desert regions are to a great extent apocryphal and have no foundation in fact. Every mining district has its lost cabin; the desert region its Breyfogle, Lee, Gunsight, Pegleg, and other fakes, on the rediscovery of which both life and money to a considerable amount have been lost without any good results.

My authority for the above version of the Golden discovery and ultimate result is Mr. M. Marsh, one of the earliest pioneers of our State and county, and an inhabitant of the desert regions for many years.

(To be Continued.)

THE Mount Morgan gold mine, Australia, paid dividends of \$5,363,150 in 1889. This is the greatest gold mine in the world. It was bought a few years ago for \$3115 and is now valued at \$73,000,000—in fact \$90,000,000 have been refused for the mine and works. The machinery and plant cost nearly \$5,000,000. During the year ending November 30, 1889, 75,415 tons of raw ore returned 223,522 ounces of gold, equal to 4 ounces 6 pennyweights 4 grains per ton for the total ore raised.

THE Pomona Progress says: The Calkins Coal Mining Company has been incorporated at Santa Barbara with a capital of \$1,000,000. The mine to be developed lie near to South Riverside. The coal obtained from the South Riverside and Elsinore coal belts is not marked first-class, but it is found to improve in quality as depth is attained.

GEORGE DAVIS, a miner in the Manhattan mine, Grass Valley, becoming faint from powder fumes, fell off a ladder down the shaft a distance of 80 feet. His partner went at once to his relief and found him with his head in the snmp. He was quite severely injured, but is now making good progress toward recovery.

GYPSUM.—The Santa Barbara Press says: Fifteen men are constantly employed in the gypsum mine in the Ojai, and the quality now being removed is superior to any product heretofore taken out. It is put in sacks at the mine and hauled to Ventura for shipment to San Francisco, where as high as \$18 a ton is paid for it.

THE Committee on Library and Museum of the Board of Regents of the State University has asked for an appropriation of \$5000 for the purchase of scientific books.

FIVE SHINGLE MILLS at Chehalis, Wash., have been kept running for months, turning out 400,000 shingles a day.

Mineral Lands.

Proposed Change in Existing Laws

The House Committee on Mines and Mining has reported to the House, with amendments, the Senate bill which passed the Senate, Dec. 18, 1890, and was submitted to the House next day. It has been in the hands of the committee since that time. The following is the full text of the bill as it passed the Senate:

SECTION 1. That section twenty-three hundred and twenty-four of the Revised Statutes be amended so as to read:

"SEC. 2324. The miners of each mining district may make regulations, not in conflict with the laws of the United States or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground by posts or monuments, so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim. On each lode claim located after the tenth day of May, eighteen hundred and seventy-two, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all lode claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein until payment of the purchase money and a certificate of entry has been issued therefor; and for each twenty acres of placer claims, and for each subdivision thereof less than twenty acres, ten dollars' worth of labor shall be performed or improvements made during each year until payment of the purchase money and a certificate of entry shall be issued therefor. But where several adjoining lode claims, not exceeding five, are owned or held by the same person, association, or corporation, and the sum of five hundred dollars or more is expended in any one year in good faith for the development of all of the claims so owned or held, not exceeding five, there shall be no requirement for separate labor or improvements to be performed or made on the several claims so owned or held during each year. The year within which the annual labor or improvements required to be performed or made by this section shall commence at twelve o'clock meridian on the first day of October of each year: *Provided*, That upon claims located previous to the first day of March in any year, the annual labor or improvements shall be performed or made on such claim for that year prior to twelve o'clock meridian of the first day of October next succeeding; and upon claims located after the last day of February and prior to twelve o'clock meridian of the first day of October in any year the annual labor or improvements required shall be performed or made within one year from twelve o'clock meridian of the first day of the succeeding October: *And provided further*, That only one-half of the annual labor or improvements required by this Act shall be necessary to be performed or made prior to twelve o'clock meridian of the first day of October, in the year eighteen hundred and ninety-one, on claims upon which the annual labor or improvements were performed or made in the year eighteen hundred and ninety; but after the first day of October, in the year eighteen hundred and ninety-one, the full amount of labor or improvements required by this Act shall be performed or made upon such claims as in all other cases during each year prior to twelve o'clock meridian of the first day of October. In case the first day of October falls on Sunday or any holiday, the following secular day shall be construed as the first day of October within the meaning of this Act. When the labor required by this Act shall have been performed or the improvements made, an affidavit may be filed within thirty days after the time limited for performing such labor or making such improvements with the recorder of deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with the conditions of this Act in the performance of labor or making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns or legal representatives do not resume work upon the claim after such failure and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made; but no relocation of a claim by a person who has already located such claim and failed to comply with the conditions of this Act in performing work or making improvements shall be valid prior to such resumption and continuance of work upon such claim. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made

the improvement may, at the expiration of the year, give such delinquent co-owner persona notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the recorder of deeds of the county in which such mining claim is situated, shall be evidence of the acquisition of title of such co-owners. Where a person or company has or may run a tunnel for the purpose and with the intent in good faith of developing a lode or lodes owned by said person or company, the money so expended in running said tunnel shall be taken and considered as expended on said lode or lodes: *Provided further*, that said lode claim or claims shall be distinctly marked on the surface as provided in this Act."

SEC. 5. That section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended in good faith to be used or occupied by the proprietor of such vein or lode claim for mining or milling purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately, subject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims; but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superficies of the lode claim. The owner of a quartz-mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill-site as provided in this section."

SEC. 6. Amend section twenty-three hundred and thirty-eight of the Revised Statutes so as to read:

"SEC. 2338. As a condition of sale each patent shall reserve the right of way through or over any mining claims for roads, ditches, canals, cuts, tunnels, and other easements, for the purpose of working other mines: *Provided*, That any damages occasioned thereby shall be assessed and paid in the manner provided by the laws of the State or Territory in which such mine is situated for assessments and payments for land taken for public use under the right of eminent domain. And the rights and easements heretofore reserved under the provisions of this section (twenty-three hundred and thirty-eight of the Revised Statutes) in patents heretofore issued shall be regulated and made available as herein prescribed."

SEC. 7. That town-site entries may be made by incorporated towns and cities on the mineral lands of the United States, but no title shall be acquired by such towns or cities to any vein of gold, silver, cinnabar, copper, or lead, or to any valid mining claim or possession held under existing law. When mineral veins are possessed within the limits of an incorporated town or city, and such possession is recognized by local authority or by the laws of the United States, the title to town lots shall be subject to such recognized possession and the necessary use thereof, and when entry has been made or patent issued for such town sites to such incorporated town or city, the possessor of such mineral vein may enter and receive patent for such mineral vein and surface ground recognized by the local laws and statutes of the United States not held or possessed adversely to the claimant for such mineral vein by other than the said city or town, or when it shall appear that the claimant otherwise entitled to such mineral vein has acquired title to such surface ground from the said city or town: *Provided*, That no entry shall be made by such mineral-vein claimant for surface ground where the owner or occupier of the surface ground shall have had possession of the same before the inception of the title of the mineral-vein applicant.

THE EXPENSES of the Consolidated California and Virginia mine for the month of December amounted to \$84,899.07, including \$35,200 for reduction of ores, \$33,222.14 for salaries and wages and \$13,371.17 for mine supplies. After paying the expenses the company had a balance on hand of about \$90,000, and the only outstanding indebtedness was about \$25,000 due the Tunnel Company for royalty on ores extracted, the tunnel company having previously received \$100,000 from the Consolidated California and Virginia on account.

NATURAL GAS.—Natural gas has been discovered on the lands of James Hunter and Joseph Wilson, only three miles from this city, and in such a way as to indicate the existence of an inexhaustible body. The discovery was made recently, accidentally, we are informed, by the lighting of a match, when a body of gas went off in a flame. The gas was flowing on the surface, and the finding of it was a great surprise. —*Vallejo Chronicle*.

THE project of sinking a gas well at Salinas is about to be resumed. The well is now down 1050 feet. It has an eight-inch bore.

A Buffalo Ranch in California.

Monterey county is to be the seat of a new California industry, in the shape of a buffalo ranch, near the Carmel Mission. There are now in the stables at Del Monte three fine specimens of the American bison, a bull, a cow and a calf, the last a progeny of the former two. Last Sunday's *Examiner* had a two-column article illustrated with the portraits of the illustrious trio, which, with the exception of a domesticated herd in Kansas, a small band under Government protection in the Yellowstone Park and a few held in captivity on a ranch in Colorado, are the last representatives of a distinctive and mighty American race, that can be saved from extinction now only by domestication.

A seven-mile drive took the writer from Del Monte to Pebble Beach, where the buffalo ranch is to be located, where Winston, the owner, was found busily at work arranging for their reception.

The ranch, which comprises about 100 acres, is located in the lee of Cypress point, overlooks Carmel Bay, and slopes easily down to Pebble Beach. Water is brought from the Carmel river reservoir, and cypress and pine trees afford ample shelter.

"I bought the cow of Redhres, one of Sitting Bull's warriors, about three years ago," explained Winston. "She was captured during the last buffalo hunt of the Sioux, in the fall of 1882, on the headwaters of the Big Cheyenne, not far from Fort Pierre, on the Big bend of the Missouri, in South Dakota. I am the first white man who ever owned her. She is now in perfect form. You know a buffalo doesn't mature until eight years of age, and Janie is just past eight."

"The bull I captured myself on the 16th of June, 1886, 65 miles southwest of Jamestown, N. D. He is the last buffalo ever captured alive in the Dakotas. I killed his mother and the calf was then so small that he didn't try to get away, but lay hidden in the long grass. I picked him up and carried him away."

"The calf was born in Portland, Or., Oct. 1, 1889, and is named the Duke of Portland. He was the first buffalo horn west of the Rocky mountains."

"These are the only buffalo on the coast and I am assured by Gen. Miles, Gen. P. E. Conner and other military men that they are the finest they have seen in captivity."

"Oh yes," he continued, "they stand captivity all right, and the climate agrees with them admirably. They eat anything that cattle will, and I am sure will thrive here."

"They know me, and I can do almost anything with them; but they will not make up with a stranger. The bull knows that I am not afraid of him, and submits to my will, but he can tell in an instant that a stranger views him with distrust, and when you glance at a tree or a convenient fence in case he should get loose, he knows just as well as any one that you are afraid of him, and immediately lowers his head and charges."

"I am going to stop here on the ranch and attend to the animals, which we shall have out here in about six weeks. I shall have an inclosure up there where you see the line of posts, under the pines, of about eight acres within the large field. The fence will be five boards high, and I think buffalo-tight. In order to make certain, however, I shall put rings on the bull's horns, and a triangle chain from the ring in his nose to the rings on his horns, which will keep him from breaking it down. I shall seed the inclosure to alfalfa and go about raising buffalo just as I would cattle."

"It will be a strange fact that here within sound of the bells of Mount Carmel, and just where old Father Junipero Serra located the pesadero, the buffalo should be saved from becoming extinct by domestication."

"In addition to rearing the pure buffalo I shall cross them with a herd of Galloways, and also with the native cattle. The cross is a successful one and has been carried down to the sixteenth generation. The Galloways are peculiarly adapted to this purpose; their coat is jet black and long, and in appearance they resemble the buffalo more than any other breed of cattle, except that they are hornless."

"The hair of the Galloways is extremely fine and the cross produces a superior buffalo robe, equal to sealskin. Some that have been obtained in Kansas have sold as high as \$250 each."

"We shall kill the progeny for their hides, and the beef will also prove valuable. Buffalo beef is the best in the world. Of course when the animal runs wild it is strong and sinewy, but when brought up in captivity and stall fed it has no equal." —*Salinas Index*.

FURNACES CLOSED DOWN.—The *Independent Callistogian* of the 14th says: Two furnaces have been in operation at the Etna quicksilver mine three or four months. The other day, however, one was shut down and the present week the other will also be shut down. About a thousand flasks of quicksilver were obtained during the season of operation. The furnaces are shut down because there is no more ore mined and ready for them. It will be some time before the fire will again be lighted.

LARGE SHIPMENTS of marble continue to be made from the Inyo county marble quarry. A great deal of machinery has been added to the mill at Verdi, and the mill is kept steadily running to its full capacity.

Hydraulic Mines and the Governor.

One day last week Senators Fraser of El Dorado, Voorhees of Amador and Calaveras, Preston of Nevada, Mead of Sierra, and Campbell of Solano, accompanied by Assemblymen Hail, Hocking, Garver, Baughman, Brown, Hunnerville, Robertson, Shanahan, Muir, Martin, Freeman and Gould, waited upon the Governor and presented the following:

Governor Markham:—As the representatives in the Legislature from the mining counties, and those representing mining interests, irrespective of party affiliation, we have met you this morning as the Chief Executive of this State to tender you our hearty congratulations and approval of the sentiments expressed in your inaugural address upon the mining industries of this State.

We congratulate ourselves and the thousands of fellow-citizens engaged in mining upon having in the Executive Chair one who has been brave enough to suggest the possibility of the amicable adjustment of the differences between the mining and valley counties of this State, whereby our mines and water ditches, which have been lying idle under the restraining order of the law so long, may be revived.

We believe that the stopping of the hydraulic mines has been of incalculable damage to the revenues of the State, and more especially to those residing in the mining counties dependent upon that great industry for the support of themselves and families.

We believe that our mining industries have not received the recognition, the support or the protection their importance entitles them to from those in authority.

As the representatives of that great industry in the Legislature, we do not ask the enactment of any law which would permit the destruction or damage to the property of others in the enjoyment of our own, but only that an honest, earnest effort be made to the end that hydraulic mining may be resumed under such regulations and restrictions as will be to the mutual benefit of all industries and employments, and to the injury of none.

We believe that the recommendation touching this subject, as set forth in your inaugural address, is the only proper course to pursue to accomplish the desired result, and as the direct representatives of the people upon that important subject in the Legislature, we recognize in you a firm friend and trust we shall have your endorsement and approval of such measures as may be presented to the Executive for approval.

THE OREGON IMPROVEMENT COMPANY.—The business of the Oregon Improvement Company, which had practically been at a standstill for the last two months, will be conducted by a syndicate of New York capitalists. About two months ago the company's property was attached and a receiver appointed. It includes the steamers Willamette and Puebla, coal mines at Seattle, large tracts of land in the Northwest, an extension of the Seattle & Northern railroad to Hamilton, the main line itself, and the unfinished line of the Port Townsend & Southern railroad. As soon as the receiver took charge the steamers were tied up, work on the extension of one of the roads and the construction of another was brought to a standstill, and fully 1000 men were thrown out of employment. The coal mines were operated, however, pending a final decision of the matter. An arrangement has now been made by which a New York syndicate takes charge of the company's affairs. The former trouble has been amicably adjusted, the receiver's task is at an end, and the representatives of the company received from him the business. The steamers, which had been tied up, will be put on, and the railroad construction, in which 1000 men were employed, will be resumed at once. The stock of the concern jumped from \$15 to \$24 per share in a few hours after the news arrived.

EEL RIVER COAL.—The San Francisco & North Pacific Railway has just concluded making experiments with coal from the Eel river mines, in Humboldt county. Two tons of the fuel were placed on the engine tender at Thurston, and the quantity was sufficient to feed the engine all the way to Healdsburg. The managers of the railroad express themselves as highly pleased with the results of the experiment. The coal burns well, and although a ton of it does not run an engine quite as long a distance as the same amount of Australian coal, yet the Eel river fuel can be mined and laid down in San Francisco at a much cheaper rate, and when the Eel river mines are more fully developed there is every prospect of a revolution in the local coal trade.

TIMES are lively in mining circles at Tintio, Utah. The hills are filled with prospectors and a number of important "deals" have lately been made.

THE second flowing artesian well in New Mexico was struck at Roswell, in Pecos valley, last Saturday. The well is only 297 feet deep.

THE old slag pile at the Tomitohi Valley works and the Moffatt smelter in Gunnison, Colo., are being worked over.

THE Mingo smelter, Utah, is running four stacks and using up about 125 tons of ore per day.

MINING SUMMARY.

The following is mostly condensed from journals published the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CRUSHING.—Amador Ledger, Jan. 17: We understand a test crushing of ore from the Hardenburgh mine at Middle Bar will be made shortly at the mill of the Amador gold mine. At the Gardner mine the rock-breaker has been giving them considerable trouble on account of frequent breakages. A machine of more improved pattern was received this week, and things will move along at a much better gait when it gets in position. The Zeile mine, which has been running short-handed for two or three months on account of repairing the shaft, will probably take on a full force next month. The McKenzie mill at Irishtown will crush 15 or 20 tons of ore from the small seams of rich rock encountered in the tunnel on the Clinton Peak property for test purposes.

BUNKER HILL.—The machinery for the new Bunker Hill mine is being put in place very rapidly. The pipe from the reservoir to the water-wheel has been laid. Mr. Myers, the superintendent, expects to have everything in running order by the first of next month. Some fine paying ore is being taken out of the tunnel near the mill. The new pumps at the Gover are a grand success. They throw a steady stream of 12 inches of water and will be able to keep the mine clear by only running a few hours a day. The electrical part of the plant runs very smoothly and requires but little attention. They have the lower pump in place, and will commence to pump out that portion of the mine under water for so many years, at once. After the dynamo is started and pumps running, no further attention is needed, as it is supplied with a self-feeding oil device, that oils bearings as needed. At the 300 level they have struck a new pay chute of ore, which promises to be a valuable ore body. A large force of men will be immediately put to work in opening out the lower levels and in sinking shaft deeper.

Calaveras.

RUNNING.—Mountain Echo, Jan. 15: The Gold Cliff mine is kept in motion day and night, likewise the mill. The mine is yielding good returns. The Lane & Tulloch mine and mill are running steadily, and as near as we can ascertain, the property is paying well.

UTICA.—Since the accident on the 5th inst., the Utica mine has been closed down pending repairs. Operations in the mill and mine will be resumed some time during the coming week.

El Dorado.

THE VAN MINE.—Georgetown Gazette, Jan. 15: The striking of rich ore in the Van mine on Tuesday has created considerable interest. The ledge, spur, stringer, whatever it may be, was reached by a 32-foot crosscut from a 60-foot shaft, but the point where the ledge was found is 80 feet below the surface, the ground having been sluiced off. Although the milling test of surface ore which has been going on for the past three weeks was highly satisfactory and a spirit of buoyancy prevailed among the crew, yet great anxiety was felt by all over the final result of the crosscut. Up to this writing the ledge had been penetrated about three feet, and the richness continues, every pan showing from a pay prospect to 10 or 15 cents in free gold. The soft decomposed quartz is similar to that above, and should the ore already uncovered continue and carry its richness, the Van will rank among the regular hullion-producers in the State.

NEW TUNNEL.—Mountain Democrat, Jan. 17: The water in the Epley shaft has been sufficiently lowered to enable the putting of a force of men at work driving the new tunnel south from the shaft. The tunnel is now being driven from both ends, on the lead. It is understood that on the completion of the tunnel, a mill will be erected at the outlet and ore crushing begun.

TRUE MILL.—The old True mill in Big Canyon, we understand, is to be put in working trim at once. When in order, it will be used jointly by the True and Harmon companies for making prospect runs of rock. Both companies are steadily developing, have good rock, and will determine its value as they proceed, by regular millruns as well as assays.

JOSEPHINE.—Georgetown Gazette, Jan. 15: Supt. L. Evans came down from the Josephine mine Sunday. The mill has been re-covered, and a new carpenter and smith's shop built. Parties were up examining the mine with the view of taking a contract to push in the No. 5 tunnel. The Cock Robin mine starts up this week, and the Rocky Gorge mine will be ready for business in the spring. General activity prevails among the mines of Volcanoville District.

GEORGETOWN DIVIDE.—The auriferous deposits of this divide are well known for their character and importance as bullion-producers in the past, and are far from being exhausted, but give promise of still important yield of the precious metal and an encouraging outlook to the financial future of this divide. The developments in mining, during the past year, give great hope and expectations for a revival, in the near future, of mining enterprises that will add much to the yield of bullion and general prosperity. While for the poor man mining on this divide offers little beyond day wages, the field is an inviting one for capital properly directed, and the writer confidently anticipates an early era in mining that will give permanent prosperity to the North Side.

Nevada.

W. Y. O. D. MINE.—Grass Valley Union, Jan. 15: The stockholders of the W. Y. O. D. quartz mine have every reason to be satisfied with the way in which it is developing, as it is now on an excellent basis, being out of debt and yielding a monthly profit of from \$1500 to \$2000 over expenses. The vein is of good size, the ground works easily, and enough is opened to give a large amount of backs in the stopes, while the drifts are being constantly carried forward to open up new ground. The incline shaft is down to the 7th level, which produces fine milling ore, and the shaft is being carried down for the 8th level, which will open up more new ground that will undoubtedly largely increase the product of the mine. The prospects are so encouraging that the company contemplates at an early day to increase the capacity of their works by putting in heavier pumping and hoisting machinery, and the

erection of a ten-stamp mill. At present the machinery is light, and the mill in use has but five stamps. Were it not for these improvements the company could commence dividends within a short time, but it has been determined that it will be the better policy to devote the profits for awhile to put a plant on the mine that will enable the workings to be sunk down to twice their present depth, and to largely increase the working force and the general operations. The W. Y. O. D. mine is an evidence of what can be done by pluck and energy. Several years ago six young men secured the location and went to work upon the vein. They had no capital, but they did have stout arms and willing minds, and determined to open a mine with their own labor. They christened their venture the W. Y. O. D. Co., which was an abbreviation of "work your own diggings," and went to work with energy. They had fair prospects at the start to encourage them, and were not long in getting down a shaft several hundred feet. As depth was attained expenses increased, and the quartz taken out did not always yield a profit, which was rather discouraging. A portion of the stock was sold to raise money, and then assessments followed. Some of the original members sold out their interests at small prices, but others held their faith, even through the greatest discouragement, and stuck to the mine in the hope that "good pay" would be struck by deeper and more systematic exploitation. Their confidence has not been misplaced, and the more the mine has been opened the better have been the results, until the W. Y. O. D. is now solid on its feet and the best little mine in this valuable and reliable mining district.

MORE SPECIMENS FROM THE HARTERY.—Tidings, Jan. 15: Supt. Fowler brought to town to-day another batch of rich specimens from the Hartery mine. The specimens were struck last night and nearly a carload was extracted, the value of which is estimated from \$3000 to \$4000. The ledge in the bottom drift from which the specimens were taken is four feet in width. The Larimer mill is kept running steadily from rock from the mine, all of which pays well.

A GOOD CLEAN-UP.—Grass Valley Union, Jan. 18: The final clean-up of 56 loads (112 tons) of ore from the Peabody mine was made at the Crown Point mill yesterday, and the result was \$30 to the ton, independent of about \$800 in specimens from the same ore which were sent to San Francisco. This ore was taken from the 225-foot level of the mine, west, and was below any of the previous workings of the mine, and where the ledge is showing regular and of good size, and where the stopes will furnish 100 feet of backs containing ore of the same quality. The crushing is an excellent one, and shows that the Peabody gives full promise for the future, and that with deeper exploitation it may be expected to be a regular and profitable bullion-producer.

HARTERY CLEAN-UP.—The Hartery mine had a clean-up of ore at the Larimer mill yesterday, which will realize about \$5000. It is the product of a three weeks' run. The Hartery mine is looking well in its lower drifts and stopes.

THE MANHATTAN SHUT DOWN.—Transcript, Jan. 18: The effort to re-open the Manhattan mine on Gold Flat has proved a failure. Considerable work has been done there within the last few months in cleaning out the old shaft and searching for the continuation of the ore body which yielded good results to former owners, but the developments were not of an encouraging character. The machinery put on the claim by the last company has been torn down and returned to the parties from whom it was obtained.

A PAYING MINE.—About 100 men are regularly employed at the Darbec drift mine and the operations are carried on at a profit to the stockholders, thanks to Supt. Gallavotti's capable and honest management. Paying gravel mines are good things to have in a neighborhood. Nevada City has a good prospect of soon possessing several.

Inyo.

MODOC BULLION OUTPUT.—Index, Jan. 14: The following is a statement of the metals obtained from the ores mined and sold by Frank Fitzgerald during the year ending Dec. 31, 1890, being the combined product of the Modoc Consolidated mines and those of Mr. Fitzgerald, as appears by returns of ores from the Melrose and the Selby Smelting and Lead Companies: Fine silver, 49,274 ounces, at average price of \$1.03 per oz., \$50,752.22; gold, \$1,941.22; lead, 281,434 lbs., at average of \$4.75 per 100, \$13,368.11. Total, \$66,065.55. Had the mines been worked during the entire year the product would have been at least 200,000 more, but for various reasons no work was done during three months of the summer. There are 30 men at work on the Hill at present, and the outlook for the current year is very promising.

Placer.

DOING WELL.—Placer Herald, Jan. 17: H. T. Power, superintendent of the Mayflower mine, near Forest Hill, was in Auburn early in the week. He reports the Mayflower and the Hidden Treasure mines as both doing well, and working at present about 70 men each.

Plumas.

AT GIBSONVILLE.—Cor. Plumas National, Jan. 17: The Thistle shaft is down 416 feet. They have just finished retimbering 90 feet of the shaft. They had to retimber on account of the ground sliding and twisting the timbers. They will soon be ready to commence sinking again. The contractors, Messrs. Gillis and Phillips, have both gone to San Francisco.

Shasta.

A PURCHASE.—Redding Democrat, Jan. 16: The Redding Reduction Works Co. has purchased a mine on Spring creek, about four miles from Copley, and will move their plant to the mine. Henry Dieble is now at the mine putting up a mill building and hoarding-house.

ENCOURAGING.—Shasta Courier, Jan. 17: The Quartz Hill and Old Diggings mines, old ones, new ones, and new prospects, are, as a general thing, showing up in fine and encouraging shape. We don't "puff" up every small strike or "Missouri prospect" as a big thing and a mine, but record solid, or what appears to be, strikes or developments. It is a theory of some miners that white flint quartz ledges, of which there are thousands in this county, are barren. Experience is demonstrating to the contrary, as several such ledges in Iron Mountain and Old Diggings districts are proving very rich in free gold and sulphurets.

SOLID QUARTZ.—Chas. P. Summers, who is doing work on the Dan Haskell mine, Iron Mountain, is now in an eight-foot wide ledge of almost solid quartz, the only "flaws" in the formation being streaks and bunches of valuable ore, and such flaws are certainly not objectionable. Summers has just forwarded a lot of ore to Haskell's order and it will be reduced in San Francisco.

Sierra.

NOT A SUCCESS.—Mountain Messenger, Jan. 17: The tramway at the Mountain mine is not a success, the inventor having failed to make it work. The mill has been shut down and all the men again discharged. We are reliably informed that the company is fully satisfied with the character of the rock thus far worked.

Siskiyou.

QUARTZ.—Yreka Journal, Jan. 14: Allen Davis has discovered a valuable quartz ledge on Willow Creek, in the mountains about a mile and a half west of his place, which assays \$30.02 to the ton according to the test of Sam Bell, a brother of Judge Bell of Shasta county. The ledge is 40 feet wide in the 24-foot shaft sunk by Davis, and can be traced from Guy's gulch near Orr's, a few miles south of Yreka, starting a little east of north, and ranging southwesterly into the dividing ridge between Shasta and Scott valleys. Several other locations have been made on the extensions both north and south of the claim of Mr. Davis, and the prospects indicate that extensive works will be erected to crush this quartz, as such a mammoth ledge would pay well for milling at even \$2.50 a ton. Gold has always been found to some extent on the east side of Yreka basin and Scott valley, and we see no reason why it should not exist in the range from Scarface to Trinity and Scott mountains, as well as on the latter mountains. In a few days, the record of claims taken up will be filed in the Clerk's office and companies will be organized to commence operations on an extensive scale. Mr. Davis has been prospecting this section for five years past, and it was also prospected years ago by our old friend, T. J. Sullivan of Sisson, and Ah Edwards of Gazelle, though Davis asserts they were not on the ledge that he has discovered. The present cold weather has caused a suspension of mining in several places, owing to the water supply freezing, but in a short time we may anticipate storms and milder weather to afford a good supply of water for all kinds of mining and to furnish power for the quartz-mills run by streams.

NEVADA.

Washos District.

CON. CAL. & VA.—Virginia Chronicle, Jan. 17: 1300 level: Continue to extract some ore from the point where the upraise carried up from the end of the east crosscut from the south drift connected with the fourth floor stopes. 1500 level: From the drift run north from the drift run west from the upraise carried up from the north lateral drift (43 feet above the sill floor of this level) at a point 20 feet in the drift, an upraise has been carried up 30 feet. From this upraise we have taken some ore about the average value of ore extraction. 1600 level: Continue to take out some ore along and above the line of the drift run east through the old stopes on the sill floor of this level; also from the stopes which we are working southerly from that drift. At a point 200 feet south from the north line of the California ground at a point 44 feet above the sill floor of this level the west drift from the south drift has been advanced 8 feet; total 23 feet. From this point are stopping the ore. The average assay from this portion of the mine is \$30 per ton. There has been extracted from all parts of the mine during the week 1214 1140-2000 tons of ore which was shipped to the Eureka mill. The average assay value of all the ore worked at that mill during the week (1380 tons) was \$18.10 per ton.

SIERRA NEVADA.—Northwest drift from the shaft station, 630 level, has been extended 57 feet; total 341 feet; continuing in porphyry formation.

OPHIR.—The drift started north from the drift run west from the winze 122 feet below the sill floor of the 1300 level has been extended 25 feet; total 119 feet; continuing in quartz of very low assay value.

UNION CON.—East crosscut No. 2, 1465 level, started from the north lateral drift at a point 200 feet north from the south boundary line of the mine, has been extended 22 feet; continuing in porphyry which carries some clay and quartz.

MEXICAN.—East crosscut No. 1, 1465 level, started from the main north lateral drift at a point opposite the west crosscut No. 1, has been extended 39 feet; total 304 feet; continuing in a porphyry formation showing some clay.

BEST & BELCHER.—800 foot level: West crosscut No. 2 has been extended 10 feet, passing through hard quartz showing some value; total length 418 feet.

CHOLLAR.—No work has been done in the raise from the 850 to 650 levels, owing to repairs to crosscut 80 feet south of the north line. Extracted and sent to the mill the past week 527 tons of ore; average battery assay, \$22.16 a ton.

POTOSI.—East crosscut No. 3, 150 feet north of winze, 1130 level, is out 66 feet; face in porphyry. The winze is down 105 feet below the 1230 level. The bottom is in clay, quartz and porphyry.

ALPHA.—The east crosscut 70 feet north of shaft, 600 level, is out 283 feet, face in clay and porphyry.

EXCHEQUER.—East crosscut near the south line, 600 level, is out 244 feet; formation porphyry and clay. East crosscut on the north lue is out 25 feet; formation quartz, clay and porphyry.

CON. NEW YORK.—East crosscut 150 feet north of shaft, 1100 level, is out 70 feet; face in clay and quartz.

SILVER HILL.—Northeast drift from the winze on 160 level, is out 580 feet; face in porphyry. Northwest drift, 334 level, is out from shaft 800 feet; face in hard porphyry.

CROWN POINT.—New northwest drift on 500 level extended 30 feet; total, 175 feet. The ground is softer with a slight seepage of water.

CONFIDENCE-CHALLENGE.—The joint Confidence and Challenge north drift on the 300 level is now in 154 feet. The face shows 8 inches of fair ore. This drift is now 23 feet in Confidence ground.

OCCIDENTAL.—South drift from the bottom of No. 5 winze 650 level, is in 84 feet; face in low grade quartz. Work at 300 and 450 levels confined to repairs.

BELCHER.—The north drift from No. 2 crosscut on 200 level is out 116 feet, having been advanced 28 feet during the week. The face is clay and

porphyry. Will crosscut from it during the week. The 400 level raise has been extended 14 feet, and is up 37 feet on the slope. The top is in low grade quartz. Are still running from the fifth floor of the old 300 level raise on a streak of fair grade ore.

ANDES.—The south drift on 420 level was extended 8 feet and work in the face suspended for the present. From south drift on 430 level an east crosscut has been started and is now in 13 feet.

SEG. BELCHER.—South drift from Belcher shaft, 600 level, is out 24 feet; total, 70 feet; face in soft porphyry.

GOULD & CURRY.—400 level: At a point in west crosscut No. 3, 41 feet from the northwest drift, started and advanced a south drift 15 feet; formation quartz showing some value.

YELLOW JACKET.—Doing the usual prospecting work at the different levels and shipping 40 tons of ore per day, the average battery assay of which is \$18 per ton.

OVERMAN.—Extracted 363 tons and 1200 pounds of ore. Car samples average \$13.96 per ton. Shipped to the Brunswick mill 400 tons of ore. Upraise from northwest drift on the 1100 level has been extended 14 feet through ore of fair grade; total length 100 feet.

JUSTICE.—The 400 level south winze was sunk eight feet; total depth, 41 feet. The bottom is in fair milling ore. Shipped to the mill during the week 179 tons of ore. Average battery assay \$22.28 per ton.

KENTUCK.—The east crosscut on the 1000 level was advanced 14 feet during the week and is now out 212 feet east of the winze. It has reached what looks like the east wall and has been stopped. Are now repairing the raise from the 1000 level in the west ledge and to raise and run north on the east ledge.

CON. IMPERIAL.—During the week have been overhauling the old stopes and following up small streaks of ore from the upper levels.

UTAH.—Northwest lateral drift from the shaft, 725 level, has been extended 37 feet; total length, 271 feet, in a porphyry formation. In this north lateral drift, at a point 250 feet in, west crosscut No. 1 has been started and advanced six feet.

SAVAGE.—During the week we have hoisted 630 cars of ore from the 300, 400, 500, 600, 750 and 1300 levels, and from the winze below 1300 level. Shipped to the Mexican mill 547½ tons of ore; ore milled, 520 tons; average battery assays, \$16 a ton. Have bullion on hand at the mill amounting to \$8610.30. The bullion yield of the mine for the month of December, 1890, was \$30,276.62. On the 300 level we started an east crosscut from the southeast ore stope and advanced same 28 feet; face in porphyry and quartz.

HALE & NORCROSS.—On the 1400 level the north and south drifts from the station have been opened and extended 55 and 30 feet respectively. Both of these drifts are in quartz and porphyry. Opposite the incline on this level we have started an east crosscut No. 1 and advanced the same 25 feet. The face is in porphyry and stringers of quartz.

Eureka District.

RICH ROCK.—Eureka Sentinel, Jan. 17: Chet Batchelder a few days ago assayed a piece of gold ore from the Prospect Mountain tunnel. It weighed 47.7 grammes and contained about \$30. The assay value of the piece of ore was \$578,746.77 per ton in gold. The ore generally found on the west side of Prospect Mountain contains a great deal more gold than silver. This piece was of extraordinary richness. It is stated by good authority that a strike of considerable importance has been made by the Eureka Con. Co. in their K K mine. It is said to be extensive and of a high grade of ore.

Jumbo District.

GOOD PROSPECTS.—Virginia Chronicle, Jan. 12: Over in Jumbo district good prospects continue to be reported. The Jumbosambo mine, owned by Harry Summers and other Carson capitalists, is being properly developed under the able foreman, Pine. He has a new shaft down 30 feet, with a very promising vein of ore assaying from \$15 to \$20 per ton.

Winnemucca District.

WINNEMUCCA MOUNTAIN.—Silver State, Jan. 17: The newly-discovered mine in Winnemucca mountain, now being developed by Dr. T. C. Hanson, Joseph Alexander, C. D. Hanson and G. W. Rose, and called the Gold Bug, is proving to be quite a large vein, and if it holds out as it is at present Winnemucca will come to the front as a mining camp. At present the boys are in about 65 feet and the vein in the face is over four feet wide and assays from \$12 to \$30 in gold, with a small percentage in silver. In a drift from the main incline they also have a vein which at present is about 16 inches wide that carries from \$30 to \$60 in silver. Winnemucca mountain, like all of the mining camps in Nevada, on account of the low price of silver, has not produced much bullion in the last 12 or 15 years, but there is any quantity of good mines and a good field for prospecting in the mountain, and when free coinage of silver shines upon this land like the Star of Bethlehem of old, Winnemucca will be one of the foremost towns in the State.

Tuscarora District.

DEL MONTE.—Times-Review, Jan. 17: North drift, 1st level, advanced 12 feet, cutting through two feet of vein matter; sample from same \$37.50 per ton.

NAVAJO.—The stopes below the 350-foot level are still producing some very good ore. Everything in and about the mine running smoothly.

COMMONWEALTH.—First level: North drift from west crosscut advanced to North Commonwealth line, 11 feet, and joint raise put up 17 feet. Raise from south drift put up 25 feet to hanging-wall. Fourth level: East crosscut extended 32 feet in hard rock; slight flow of water.

BELLE ISLE.—The 350 stopes are improving and looking very well indeed, yielding a high grade of ore which is stored in the mine. Hoisted 41 cars of concentrating ore. West crosscut from the 450 level extended 13 feet; face in large blocky ground. A drift has been started south on the vein cut two weeks ago; progress 18 feet. Joint east crosscut, same level, extended 14 feet, cutting considerable vein matter giving low assays.

NORTH COMMONWEALTH.—First level: North drift advanced 11 feet to line and joint raise now up 17 feet; not yet through the vein. Will resume work in north drift as soon as the raise reaches the hanging-wall. Fourth level: North drift advanced 28 feet; the rock is softer and some water. Second

level: West crosscut advanced 28 feet, reaching vein exposing some fair-grade ore; slight flow of water. Have started drift toward Commonwealth line. Hoisted 20 cars of ore; assay \$250 per ton; 76 cars ore, estimated value, \$25 per ton.

NORTH BELLE ISLE.—North drift from Belle Isle, 450 level, extended 15 feet; still showing very large vein. Joint east crosscut, same level, extended 14 feet, showing large quantity of vein matter giving low assays. Upraise from the south drift, 500-foot level, extended 11 feet in hard quartz showing some good ore. This connection will soon be made with the south stope and the ore at that point will be available. The 300 stope is looking about the same, the ore extracted being stored in the chutes below. Hoisted 60 cars concentrating ore, estimated assay value \$18 per ton. Concentrator crushed 318 tons of ore, estimated assay value \$15.09, giving 24 42 tons of wet concentrates, estimated value \$153. Several gangs of tributaries are working in the old 150 stopes.

ARIZONA.

SILVER STRIKES AT RICHMOND BASIN.—*Silver Age*, Jan. 10: Joe Brewster, who was in from Richmond Basin last Sunday, informed us that the recent strike in the Bootjack mine is proving even richer than was expected. Six or seven sacks of ore had been taken out which will assay from \$3 to \$5 per pound in silver, and the bottom of the shaft had scarcely been cleaned up. The ledge at that depth (56 feet) is about four feet wide and all pay ore, averaging 100 ounces or more, and two feet of the ledge, over 250 ounces; in the center is an inch streak of almost pure antimonial silver. The find has not been sufficiently prospected to reveal its extent, but the general belief among miners at the Basin is that Sinds and Richards, the lucky owners, have the mother ledge, which, it is said, can be traced on the surface for a distance of one mile and a half. The Bootjack is only one of several very promising prospects. Moyle and Deam have almost as good a showing in the Harrison & Morton claim, and Moyle says he would not exchange their claim for the Bootjack. At a depth of 25 feet they have eight inches of ore that assays 600 ounces, and the showing is excellent to take out considerable of it. Moyle is confident that, from the character of the ore, the lead is permanent. Kingdom and Cohlbedick, lessees on the Grub Stake of the Mack Morris, have a fine showing—a six-inch streak of ore that goes about 1000 ounces in silver. Ikenberry and Decell, who have a sub-lease on Mack Morris ground, are taking out ore and doing well. Joe Brewster owns one of the best claims in the Basin, the Southern Star, which has already produced considerable ore. The claim lies in a gulch which drains the Basin, and water was encountered in quantity to hinder work. By running a tunnel to connect with the shaft and extending it beyond, giving a length of 200 feet, with several crosscuts, Mr. Brewster has thoroughly drained his mine and opened it up well. The possibilities of the Basin mines for the coming season are great, and it would occasion little surprise here if the work now in progress would result in opening up some of the richest silver mines in Arizona. Richmond Basin is 13 miles north of Globe on the southwest slope of the Apache mountain, with a good wagon-road all the way.

SILVER KING.—*Florence Enterprise*, Jan. 10: At the Silver King mine the usual unsettled condition of affairs exists, brought about by the near approach of the election of a new management. Supt. Groves has continued work in the Bilk shaft for the past year. Report says, if the present management continues the Bilk shaft will be given up and work renewed in the King shaft at the 400-foot level. From here the work will be done toward the South King. There are those who maintain that the King will yet be as good as it ever was, but with no ore in sight, one man can see as far into the ground as another, and no farther. The mill is still running on tailings, but another month will finish them. The Mineral King M. & M. Co.'s plant is up and ready for business. The plant is of 10-ton capacity, all of first-grade workmanship. The water supply comes from the mine. It is said work will begin as soon as the coke arrives. The mine is sunk to the depth of 400 feet. Several crosscuts have been made. W. H. Lemper is still working on the South Comstock and can show as much work done on a claim as any man in Arizona. There are several claims in the neighborhood that are taking out good ore.

REYMERT.—The Reymert will close down about the last of next month for an indefinite period. This action is not the result of a lack of profitable ore, for the mine never looked more promising. Supt. Strohn has just met with a great loss in the burning of his lumber-mills at Sheboygan, Michigan, which left him nearly \$50,000 poorer in pocket, and he will return to the States where his presence is needed. Just when the mine will again resume operations is not known. The mill and mines of the Arizona G. & S. Mining Co. at the Owl Heads, were attached last week to satisfy the demand of A. Goldschmidt & Co., of Tucson, for supplies. It is stated that the total indebtedness will reach nearly \$12,000. The mine has been a steady producer and regular bullion shipments have been made from time to time, and the attachment was quite a surprise to many people who know the value of the property. A large portion of the indebtedness is owing to the employees in various sums.

GOLD BASIN.—*Mohave Miner*, Jan. 17: Henry Schafer is in from his Gold Basin mines. He informs us that he has a ledge opened up to a depth of 180 feet, which averages \$65 in gold per ton. The ledge is three feet in width. At the Etta and Jonathan Mr. Cummings has out a carload of his rich ore ready for shipment. These two claims are Mr. Cummings' little bank, from which he draws his regular little "pile" whenever he feels so inclined.

TUNNEL.—Wm. Frost and Wm. Morrison are driving a tunnel to cut the vein on a claim they have located near Antelope wash in Maynard district. They have struck some very hard rock, but expect to cut the vein in about 20 feet more, when they look for rich ore. John Tillman, Ed Gilbert and L. Kimerly left on a three months' prospecting trip to the Santa Maria and Harqua Hala country Tuesday. Mr. Gilbert is well acquainted with that country and is in hopes of discovering the source from whence the placer gold found in that country comes.

THE GOLD BASIN mill will probably start up the first of February. A thorough sampling of the mine showed an average assay value of \$15 per ton for a width of 18 inches. It is claimed that the ore can be mined and milled for \$8 per ton, leaving a good margin of profit for the owners. The probability is that the company will also purchase a mine of Judge Schaefer, and with these two mines will be able to make a success of their mill. The cold weather has forced the lessees on the C. O. D. dumps to cease work. We understand that about \$30,000 have been taken from the dumps in the last ten months.

BRITISH COLUMBIA.

TRAIL CREEK ORE SAMPLED.—*Nelson Miner*, Jan. 10: Conflicting reports are heard as to the value of the ores of Trail Creek camp. One report is that the ore is too refractory for possible treatment; another that it will pay if the quantity said to be, is actually in sight. N. Hoover of Nelson has done as much as any other one man to test the merits of the district. He and his partner have men at work on the Lily May, and a shaft is now down over 30 feet, with 3 1/2 feet of ore in the bottom. Some time ago Mr. Hoover sent an average sample of the ore to the Northern Pacific Reduction Co. at Spokane Falls, to ascertain if it could be shipped at a profit. Advice from that company are in effect that the ore contains 3 1/2 per cent copper, 7 1/2 per cent lead, 8 1/2 per cent zinc, 101 ounces silver, and \$8 gold per ton. For ore of like character the reduction company will pay 90 per cent of the lead and 95 per cent of the silver and gold, charging \$20 per ton for treatment, the ore to be delivered at Spokane, freight and duty paid. At these figures the ore would net the owners about \$50 a ton, over and above mining, transportation, duty, and reduction charges.

AN EIGHT-THOUSAND-DOLLAR SALE.—The owners of the Grizzly Bear and Silver Queen have effected a sale of these prospects to a representative of the Omaha smelting works. The terms of the sale are conditioned on crown grants being obtained for the ground. The Grizzly Bear has had considerable development work done on it; the Silver Queen little more than the amount required to obtain a crown grant. Both are believed to be spurs or offshoots of the Silver King ledge, the ore being of similar character. Eight thousand dollars is the price.

COLORADO.

CLOSED DOWN.—*Idaho Springs Gazette*, Jan. 17: On account of a shortness of water the Mattie mill was compelled to close down. It is expected that the weather of the past few days will increase the supply sufficiently to enable the plant to start up in a short time.

SMELTER.—We have it from the most reliable authority that the Omaha & Grant smelter will increase its capacity to 700 tons per day. The Globe smelting works have increased their facilities so that they can handle 500 tons daily. The capacity of the Argo works has also been largely increased. All this shows that they expect a largely increased output, and the improvements will be the means of creating better prices for ore all around.

DAKOTA.

HESTER A.—*Deadwood Pioneer*, Jan. 17: A force of men is at work on the Hester A., at Galena, under the superintendence of John Gherkin, and a good quality of ore is being taken out. The farther the development progresses, the better the mine appears.

RICHMOND.—The mill belonging to the Richmond company, at Galena, was all fixed preparatory to starting up yesterday, but when the engine was turned loose the driving rod broke, necessitating shutting down. A new rod has been sent for from Fremont, Neb., and as soon as this is received, which will be in about ten days, the mill will be started up. The ore all comes from the Richmond mine, and a large enough body is in sight to keep the mill running continuously. Some of the ore recently struck will carry 600 to 800 ounces to the ton.

IDAHO.

GOLD ORE.—*Wood River Times*, Jan. 17: Herbert Hersley, of Soda Springs, whose company owns a 40-stamp gold mill which crushes from 120 to 150 tons per day, which yields \$5 per ton, says that it costs one-half of this, or \$2.50 per ton, to mine and mill. The vein is quite large and the ore soft. Instances where it costs less than \$1 to mine and mill abound in California. With this knowledge of the cost of operations elsewhere it seems to us that the parties interested in our Gold Belt should be able to approximate it. To be sure they are not supplied with the proper appliances to work at as low cost as in California or even in Cariboo; but the grade of ore is much higher here than it is there, and this should more than offset the advantage derived from the use of water-power for which a heavy rental has to be paid.

FROM LOST RIVER.—*Ex-Sheriff Furey* is in from Lost River. The Big Copper Co. is working its mines and smelter at Cliff with satisfactory results. The smelter was blown in a week before Christmas, and has been running uninterruptedly, and regular shipments of bullion to the railroad have begun. The smelter demonstrates that the ore is of much better grade and carries a much higher percentage of copper than was expected. About 100 men are employed about the mines and smelter. The Grand Prize mine, adjoining the Big Copper group, was sold for \$20,000 cash about one month ago. Mill. Brown is the superintendent, and about 20 men are employed. The company being amply provided with funds, it will develop its mine, having test lots of ore smelted occasionally, with the intention of eventually putting in a smelter.

THE DOLLARHIDE GROUP.—*Ketchum Keystone*, Jan. 17: Mr. A. Dollarhide is a large owner in the Dollarhide group of mines, situated at Smoky, and the present showing made by the property is highly encouraging. They have run three tunnels lengthwise of their vein, each one below its predecessor, the lower one of which at its farthest point in the mountain is about 400 feet below the surface of the hill. In the lowest of these tunnels ore is found for a distance of 140 feet, and the chute or chimney it is in is not connected with another chute tapped by the two tunnels above, and from which all of their ore thus far shipped from the mine has

been taken; but it is thought 100 feet more of tunnel will tap the original chute. Both of the upper tunnels yielded good ore, as did several upraises made along their course. The walls are from 8 to 20 feet apart and are both of hard black rock, probably lime. The space between them is filled with gangue and clay, more or less interspersed with ore, while the ore seam proper is generally about a foot wide, but varies from 1 to 3 1/2 feet. The clay in which this is imbedded is so tough as to be difficult of removal, but slacks readily on being exposed to the sun, and has yielded by assay test as high as 135 ounces to the ton. Its average value is somewhere between five and eight ounces. The ore seam is mainly on the footwall, but the richest ore is found on the hanging-wall.

DE LEMAR BULLION.—*Idaho Avalanche*, Jan. 17: Sixteen bars of bullion, weighing in aggregate 25,740 ounces, were shipped from the De Lemar mine this week. The assay value of these bars has not been made public, but the fact is well known that the shipments from that mill run over \$3 per ounce, and it is safe to estimate the shipment, 30 days run of the mill, at \$80,000. The amount of high-grade ore shipped in sacks is said to have slightly exceeded the previous month, so that the last month of last year has proven the best producer since the mill started. At this rate there will be no necessity of drawing on the reserve fund to pay for the construction of the new \$750,000 mill contemplated. Build it as rapidly as they may, the current product of the mine will pay for it.

THE LAST CLEAN-UP of the Leonard mill, running on Phillips & Sullivan ore, has placed to the credit of that mine nine bricks weighing 100 pounds each and assaying a little over \$2 per ounce. This is the last ore that will be crushed from that mine until the roads are again open in the spring. The development work now going on already assures much bigger and more frequent shipments when they begin again.

COW CREEK.—Dave Farmer is now camped at Cow Creek, with men working some of the claims belonging to him and others in that new camp. All reports that come from there indicate that region will be a Mecca for miners and prospectors, next summer. A number of the claims now slightly prospected are showing up rich.

THE FLINT MILL is still producing rich concentrates, but not having been constructed for the purpose for which it is now run, there have been a good many delays and stoppages. Enough has been done, however, to prove that the ores of the camp can be cheaply and profitably worked into concentrates, and with cheaply constructed concentrating mills to work the large quantities of ore found in the camp, it has a bright future in store.

LOWER CALIFORNIA.

ALAMO.—*Cor. Lower Californian*, Jan. 15: We have had cold weather at Alamo for a week past, making it necessary to huddle around the camp-fires and fire-places. H. S. Sherard has a bond on the Tarantula mine for six months from the owners, Messrs. McCarthy & Martin, but the bond was given with the understanding that Russell & Rhodes had a previous agreement with the owners to work the Tarantula, and if they wished to retain the mine the bond was to be declared null and void, and Mr. Sherard was to be recompensed for any expense incurred in working the mine. Upon the return of Russell & Rhodes to camp they signified their desire to take the property in accordance with the agreement with McCarthy & Martin, and so Mr. Sherard has severed his connection with the Tarantula, after being recompensed by the owners. In the 12 days that Mr. Sherard worked the Tarantula he took out 47 tons of ore, some of which was very rich. He is now working the Richmond, which adjoins the Aurora. John W. Mitchell has his mill, the Manzanita, and with the added improvements which he is about to make, will soon have a busy scene about his camp. Col. Lane & Sons will run the Alamo mill and do their own amalgamating hereafter. This mill was lately leased to Col. Lane's former amalgamator, Messrs. Hjalworth, Sherard and Chas. Hossack are putting some rock through the El Paso mill from the Richmond gold mine.

MONTANA.

BUTTE AND BOSTON.—*Inter-Mountain*, Jan. 16: The smelters of the camp are all running to their full capacity and their output of copper matte and copper is weekly on the increase. The only trouble experienced has been the inability of the many smelters to reduce the amount of ore produced, thus keeping some of the mines partially inactive. The Butte and Boston people are adding daily to their already great works, and the output of this company bids fair to outdo any smelter in the camp if the improvements are added as rapidly in the future as they have been in the past. The mines of this company are being opened up and in all of them the most encouraging prospects are being met.

THE SILVER DISTRICT.—As for the silver mines of the camp, all are running and every stamp dropping, and the usual shipments of bullion are regularly made from each company. The underground developments in the Lexington are simply immense, and the ore body on the 1500 continues as strong as at the time it was first crosscut. Extra good ore is being taken from the 11, 12 and 13 of the Alice, while the Moulton Co. only waits the reports of the developments as they progress in both the Alice and the Lexington, that they themselves may be tempted to sink below their present depths. The Gray Rocks and the Belle of Butte continue to be the main source of supply for the Silver Bow mill, and from these mines there is taken some of the richest ores produced in the camp.

ZOSOL DISTRICT.—*Montana Mining Journal*, Jan. 17: Operations have commenced on the Bridge street ledge in Zosol district. It is the intention to run a tunnel 150 feet for the purpose of tapping the ledge at considerable depth.

ORE.—Considerable ore is being shipped to the East Helena smelter from the sampling works at Boulder, two carloads from that point being received at the smelter during the past two weeks. It has been reported and confirmed that the London mine at Neiha has developed an ore chute 750 feet in length, with every indication that it may extend the full length of the claim. This property has the "earmarks" of a great mine.

BONDED.—It is stated that Wm. Zosol has bonded the Carbonate Extension mine, located near

Deer Lodge, to Chas. Meader of Butte and J. C. Shaubert of Deer Lodge. The bond is for \$10,000 and runs for six months. Work on the property will be commenced at once.

ON THE GRANITE LEAD.—*Phillipsburg Mail*, Jan. 15: There appears to be great activity on the line of the great granite lead. The Bi-Metallic Co. is sinking a 3-compartment shaft on the Faony Parrell, and it is understood to be its intention to sink 500 feet before crosscutting. Farther west on the Zeus, sinking is still in progress, and yet farther west the Bi-Metallic Extension people are about ready to resume sinking and have machinery almost ready to move, having a capacity of 1000 feet. This company seems to have every confidence of finding rich ore, as they intend to sink 500 feet before crosscutting to the vein.

MINES OF MARYSVILLE.—Speaking of bonanzas, what's the matter with the Bald Butte? At its present rate of production it will soon make millions of several Helena men. The last mill-run aggregated \$14,500, an average of \$158 per ton. Pretty big, isn't it, for a mine that was once abandoned as played out? The papers are full of the Spotted Horse and it seems strange they have so little to say of the Bald Butte—a bigger bonanza and one lying right at Helena's door. Its development? It has 80 feet of levels on the 100 which expose an ore chute fully eight feet wide. The footwall has never been found yet, and the Lord only knows what will be opened up by the time they reach it. The main shaft is down about 150 feet and still going. It is the intention, I believe, to crosscut on the 200. I don't know anything about the company's dividends. Another may be declared soon, or the profits may be reserved for the purchase of the new 20-stamp mill, which I hear will be put in next spring. I do know that the Bald Butte is a bonanza, however, and one of the greatest in Montana.

OREGON.

MONTHLY DIVIDEND.—*Bedrock Democrat*, Jan. 14: All thoughts of dull times were last Sunday for a time dispelled by Supt. Oliver of the Baisley-Elkhorn mine who arrived in the city and, reining up his roadsters in front of the First National Bank, alighted and with some exertion carried within the output of the Baisley-Elkhorn mine for the past 20 days—two gold bricks weighing something over 500 ounces and valued at a little over \$8000. The bricks by this time have been forwarded by the bank to the United States mints for coinage, one to Boise City, Idaho, and the other to San Francisco.

UTAH.

MAMMOTH.—*Salt Lake Exchange Journal*, Jan. 3: There is hardly a producer in Utah but that is steadily increasing its dividends right along. From every camp, almost, the ore output is doubled or quadrupled. The Mammoth mine, in Tintic mining district, is an illustration of what the mines of Utah are doing for their shareholders. During the past four years it has paid \$720,000 in dividends as follows: 1887, two dividends, \$20,000; 1888, five dividends, \$50,000; 1889, six dividends, \$130,000; 1890, 14 dividends, \$520,000. Total, \$720,000. This is a splendid showing, and the mine grows richer as development work progresses. In this property pure horn silver is found in large quantities, and gold ore, over half pure, is often encountered. Charlie Stehbins, the new superintendent of the Mammoth, will have a chance now to bring his large mining experience into full play, and by Jan. 1, 1892, we shall expect to chronicle a greater increase in its dividends than that noted above, as the Mammoth is as yet virgin soil.

Blind Requests.

It is surprising how thoughtless and careless some persons are in remitting money to newspapers, and in making requests in regard to changing the address of their papers. Almost every week some "blind" requests and blunders reach us, resulting from oversight and carelessness on the part of those who send them.

It is a common thing for us to receive requests like the following:

"Please change my paper to Blankville, as I have gone there to live. Yours truly, JOHN SMITH."

But as "John Smith" failed to give us his former or present address, we cannot make the change he requests without searching over thousands of names on our mail list—a work that would require a week to accomplish; and as there are many John Smiths, it would probably be unsuccessful in identifying the one sought after, even if the search were made.

Some persons request us to send their paper to such and such a place, not only without giving their present address, but even without giving their names. Of course, not knowing who the writer is, nor where he receives his paper, we cannot make the change he requests, and must wait until he writes again to complain that his former request has not attended to. But this was entirely his own fault. If he had sent in his name and former or present address, his request could and would have been promptly attended to.

Sometimes persons remit money in letters, and with similar carelessness neglect to give their address or name. In such cases we cannot enter credit for the money thus blindly sent us until we are subsequently informed from whom it came by the person who sent it and who complains that he has not received credit for his remittance. Of course, the delay in crediting the money was caused by his own carelessness.

It is the custom of printers to call all defective, disconnected, mislocated and unintelligible manuscript, or portions of it, "blind," and the term is appropriately applicable to the kind of requests sent us which we have cited above. They are "blind" requests and cannot be attended to for the reasons stated.

We hope, therefore, that all our friends will hereafter exercise a little thoughtfulness and care in this matter, and whenever they remit money to us, or desire us to change the address of their papers, we beg them always to state the postoffice, county and State to which their paper is now sent, as well as the one to which they wish it sent, together with their full name, and their requests can then be complied with. In short, we beg them to send us no more "blind" requests.

MECHANICAL PROGRESS

Friction and Lubrication of Journals.

Prof. John Goodman points out that the friction per square inch of a journal thoroughly lubricated, and so running upon an oil film, is within limits, independent of the load. The limit is imposed by the pressure which the oil film will bear without being squeezed out and allowing the metals to come into actual contact with each other. At low speeds, however, the friction is greater than at high speeds, and it has been found to decrease gradually till the surface speed of 1000 feet per minute is attained, when it varies very slightly, being, in fact, practically constant for a considerable range. This is true, however, only for considerable loads per square inch, such as 400 pounds, the area of the journal being estimated by multiplying diameter of shaft by length of bearing.

At loads under 60 pounds per square inch, according to Goodman, the friction gradually decreases with a reduction of speed, but when the intensity of the load is greater than this, the friction increases when the speed falls below 50 feet per minute. With low speeds, a load greater than 60 pounds per square inch seems to squeeze out the lubricant and to increase the friction. The experiments elicited one interesting fact well known in practice to railroad engineers, namely, the effect of slight side-play in reducing the friction of a journal. A journal with a slight side-play, and moving from side to side, has greatly less friction than one in which the side-play is entirely taken up. It is, of course, impossible to allow any great amount of side-play to the crank-shaft of a steam engine, but still this fact proves how advisable it is to fit main brasses and connecting-rod brasses slightly easy, and explains the heating which is often caused by too good a job being made of the side fit.

A constant load must be less in intensity than an intermittent one; thus a dead load such as is usually allowed on railroad axles, should not exceed 450 to 500 lbs. per square inch, while in crank-pins, where the load is intermittent, a maximum of 2000 lbs. per square inch is often applied without heating. On the gudgeon ends, where the sliding velocity of the surfaces is not high, as much as 5000 lbs. per square inch is allowed. The load, however heavy, takes some time to squeeze out the oil film, and so a heavy load only momentarily applied and then reversed does not get time to bring the metals into actual contact, although a smaller load continuously applied is quite able to do so. The whole efficiency of the journal depends upon its support upon this lubricating film, and the friction is caused, not by the contact of the metal surfaces, but by the continuous work of shearing the oil film existing between those surfaces. It is very interesting to reflect that the efficient working of our great engines depends on a lubricating film of from 1-10,000 to 4-10,000 of an inch thick, and furnishes one more illustration of the minute matters to be examined into before we can be said to understand the simplest actions of those great machines.—*Ex.*

GROWTH OF THE STRUCTURAL IRON TRADE. The impression has been created, by the rapid increase in the number of large fireproof buildings in our leading cities, that the consumption of iron and steel beams must have developed at a tremendous rate. So far as we can learn, that is not the case, the production being at the rate of about 100,000 tons per annum, while it was 90,000 tons two years since. As compared with the consumption of barbed-wire, tin-plate or nails, this quantity is very moderate indeed. It sinks into insignificance beside the demand for rails or pig-iron for foundry purposes. It has been urged that the consumption of beams would increase enormously were the price lower. In Germany, where the demand is far more widespread, the beam manufacturers have adopted a simple method of introducing their wares. The village builders have been accustomed to follow certain rules based on experience for determining the dimensions of the timber used for certain spans. The rolling-mills get out hooks giving the exact equivalents in strength of the different sizes of sticks of timber so used, with the price of the steel beam, delivered. Thus the small builder is placed in the position to tell at a glance whether it is cheaper for him to supplant wood with steel. It is reported that the consumption for small buildings has grown in an extraordinary degree. Still, we question whether such a result could be reached in this country, because the relative cost of timber and steel is quite different. How it will be upon completion of the increased capacity for manufacturing beams now being provided, is another question. The trade looks forward to a lowering in prices when the additions to plant are completed.—*Metal Worker.*

A NEW IDEA IN THE MANUFACTURE OF TUBING.—A new idea has been worked out in the manufacture of tubing in the construction of a flexible tube for conveying gas, steam or liquids under considerable pressure. This tube has sufficient flexibility for all practical purposes, with the additional advantage of great strength and durability. A triangular wire is pressed between the coils of a round wire during the process of constructing the tube with sufficient force to spread them apart, so that the contact surfaces are at all times under pressure. The triangular wire serves two purposes;

one is to spread the coils apart, so that the pressure will be exerted on the contact surfaces; the other is to fill the irregular shaped spaces between the coils of the round wire, adjusting itself to the changing form of the spaces caused by any given flexion.

WHAT MOLDING SAND SHOULD BE.—The mold has an important function to perform in the process of casting. It must resist the pressure of the liquid metal in every direction, and at the same time give a free escape to the air and gases generated in the mold while being filled, and during solidification. It must give to the casting a clean smooth surface, and allow an easy separation from the sand. It must neither act chemically upon the liquid metal nor be affected by it at the high temperature at which it is brought in contact with the sand. The higher the temperature of the liquid metal, the more difficult it is to comply with these conditions, and the fewer are the substances which can be used for this purpose. The presence of three per cent metallic oxides in molding sand impairs its refractory qualities. Still more undesirable is the presence of lime, one per cent of which will make sand undesirable for good castings. Lime present as a carbonate gives off its carbonic acid gas at the temperature of liquid iron, causing the latter, when in contact with the mold, to form bubbles and air-passages which destroy the smoothness of the surface. If present as caustic, it will vitrify and adhere to the face of the castings. The best molding sands are those that contain the largest proportion of silica; from one to three per cent magnesia; an entire absence of lime with sufficient alumina to render the sand cohesive and plastic. Sands of the above description are seldom found in a natural state.—*Iron and Steel Manufacture.*

THE BEGINNING OF IRONMAKING IN AMERICA.—Mr. Durfee gives some interesting information on the beginning of ironmaking in the United States. In "Early Steps in Ironmaking," he states that it is certain that at Lynn, in the Province of Massachusetts Bay, was cast, in the year 1645, the first piece of hollow-ware made in America—"a small iron pot capable of containing about one quart." This pioneer of all American-made castings was in existence in 1844, but recent efforts to ascertain its whereabouts have been unsuccessful. The works at Lynn appear to have been prosperous for a number of years, but after a time they became unpopular, owing to the flooding of lands by the breakage of the dam and the great destruction of timber for fuel. Rev. Wm. Hubbard, writing in 1677, says that they were "strenuously carried on for some time, but at length, instead of drawing out bars of iron for the country's use, there was hammered out nothing but contentions and lawsuits." After the establishment of this first successful "furnace" and "foundry" at Lynn, works for the manufacture of iron were erected in other parts of New England, and thence the business spread into New York, New Jersey, Pennsylvania and Maryland. During the French War (1755) there were a number of furnaces in operation at which "cannon, bombs and bullets" were made in great quantity, and many of these works furnished similar supplies to the continental army during the Revolution.

INGENIOUS MECHANICAL DEVICE.—Some valuable improvements have been made in faceplate jaws, so that, by providing recesses at each end for nuts, the jaws can be used on faceplates or plates having T slots, being then, of course, easily adjustable to any position in the slot by loosening the bolts. At the same time holes are drilled and tapped in the body of jaw, by which it can be attached to the plate in the old way, if desired. The jaws are reversible on the plate, the sliding jaws are reversible in the blocks, and the screws are reversible both in the blocks and of themselves, being squared for the wrench at both ends. The sliding jaws have parallel grooves the entire length, and the bearings of the screws in them also extend the complete length. It is found that four of these jaws attached to the faceplate of a lathe, or to the table of a boring-mill or drill press, etc., make an excellent substitute for the chuck, especially for the larger sizes of the latter, and to which they are on many accounts preferable. The jaws may be put on and taken off the plate very easily, one man doing the work alone and without the aid of any tackle.—*Boston Journal of Commerce.*

MITSUBISHI METAL has been found by Prof. Silvanus Thompson to be far superior to ordinary cast-iron, and not much inferior to wrought-iron, for electro-magnets. Its great advantage for the cheaper forms of dynamos and motors is that it can be easily cast to the form required, and the expensive forgings avoided that are now necessary with wrought-iron.

WEIGHT AND POWER.—It is said that Mr. Maxim, the inventor of the "Maxim gun," claims to have constructed an engine of 500 horse-power, weighing only 1100 pounds, or 2.2 pounds per horse-power. Some of the larger and most efficient engines have about 112 pounds dead weight per horse-power, including water.

IN A TEST OF STEEL at the Carpenter Steel Works at Reading, Pa., last week, an inch bar broke at a strain of 233,333 pounds—20,000 pounds in excess of the best record heretofore made.

SCIENTIFIC PROGRESS.

Can Plants See?

The candid observer must admit that many plants act as if they had the faculty of seeing. At any rate, they manage to find food and support by some special sense, which the unscientific mind cannot name any better than to call it sight. Mrs. King describes a very curious instance of this habit of looking out for support on the part of a creeping plant in India.

"My husband has broached a theory that I cannot remember to have met with before, namely, that creeping plants can see, or at any rate have some faculty equaling sight. He was sitting in the veranda with one foot up against a large pillar, near to which grows a kind of convolvulus. Its tendrils were leaning over into the veranda, and to Robert's surprise he presently noticed that they were visibly turning toward his leg. He remained in the same position, and in less than an hour the tendrils had laid themselves over his leg.

"This was in the early morning, and when at breakfast he told me of this discovery, we determined to make further experiments. When we went out into the veranda the tendrils had turned their heads back to the railing in disgust. We got a pole and leaned it up against the pillar, quite 12 inches from the nearest sprays of convolvulus.

"In ten minutes they had begun to curve themselves in that direction, and acted exactly as you might fancy a very slow snake would do if he wished to reach anything. The upper tendrils bent down and the side ones curved themselves until they touched the pole, and in a few hours were twisted quite round it.

"It was on the side away from the light, and excepting the faculty of sight, we can think of no other means by which the tendrils could be aware that the pole had been placed there. They had to turn away from the light to reach it, and they set themselves in motion visibly within a few minutes of the pole's being there."

Tanning by Electricity.

We recently gave, in these columns, an account of some experiments wherein it was claimed that by the use of electricity, the time for tanning leather was greatly shortened, whereby an important economy in the process was secured. The process, if we rightly recollect, was of German origin.

More recently an agent of the inventor visited New York with the view of introducing the invention to our American tanners. As no one seemed inclined to take it up on the representations of what it had accomplished in Europe, it was finally agreed to submit it to a test, under the joint direction of Mr. J. S. Schultz, and the agent at Newark. The test as described by the *Shoe and Leather Reporter*, was conducted as follows:

"Prepare two circular revolving vats. Into each of the vats shall be placed a given quantity of extract liquor, and the same number and quantity in pounds of prepared sides. In short, the conditions shall in all respects be equal. To the one vat shall be added the electric current and to the other there shall be no electric current. After revolving these vats for a sufficient time to tan the sides accompanied by electricity, they shall be taken out. If, on examination, the side in the vat which has not had the advantages of electricity should require more time, such time shall be taken and credited to the account of electricity."

The agent finding that this was the only course left to him, agreed to the conditions, and the experiment was tried at the factory of T. P. Howell & Co., of Newark. The result was exactly what Mr. Schultz had anticipated. It was shown conclusively that the revolving vat which was not subject to the electrical current, tanned leather as fast and as well as the other.

To sum up the whole matter, the vats of the tanners can be propelled by electricity or without it; there is no harm done if it is used, nor any good done if it isn't used. We have two specimens of leather before us, says the *Reporter*, one tanned electrically, the other not; the same time was employed on the production of each; the latter is fully as well tanned as the former—if anything, a little better.

DISSIPATING THE ENERGY OF A TORNADO.—Prof. H. A. Hazen, in *Science*, discusses the possibility of dissipating the energy of a tornado by artificial means. He is of the opinion that serious damage may be warded off from a town or a village by an extensive forest to the west and southwest. The electric tension might also possibly be relieved by a properly arranged network of wires and poles placed in the direction of usual approach. "A tornado is exactly the same as a waterspout at sea," he says, "and if ships have broken up such a spout from the concussion produced by the firing of a cannon, there seems no reason why the energy of a tornado may not be largely diminished by the explosion of gunpowder or dynamite."

ALL FORMS ARE CELLULAR.—All life is cellular; this is true of the lowest plant and of the most highly developed animal. In the unicellular organism all the functions of life must be performed by the one cell; it must absorb, digest and excrete. It must fecundate and reproduce its species. As we ascend the scale of

development we find a greater number of cells in the body. Not only do the cells multiply in number, but there is a division of labor among them, and the more marked this differentiation becomes, the higher stands the organism. In man, some cells take upon themselves the duties of digestion, others, that of elimination; some are concerned in locomotion, others in cerebration; others reason from the facts thus recognized. Communities of cells, engaged in the performance of a certain duty or duties, constitute an organ; and these, with their paths of intercommunication, form our bodies. Health is maintained only when each of these various communities of workers does its duty fully. If the pancreas fails to elaborate its proper secretion, the food does not undergo the normal digestive changes, and the liver, the heart, the lungs, the brain, and in short, the whole mass, becomes diseased or out of health.

THE FORCE OF VEGETABLE GROWTH.—Numerous are the evidences of the power of vegetable life in overcoming obstacles in the way of its growth. Grain dealers and warehousemen tell of wheat and barley blades growing through wooden flooring, and some men declare that grain will sprout and grow through a layer of asphaltum. But one of the strongest evidences of the strength of vegetable life is told in a late issue of the *Stockton Independent* as follows: There is to be seen at Russell's stables, in this city, mushrooms which are pushing themselves up through three inches of concrete and two inches of bituminous rock covering, which was laid hot and rolled smooth with heavy iron cylinders. In the rear portion of the stables, where vehicles are kept, the concrete and bituminous rock flooring was laid over ground which was at one time used as a corral. The floor was laid more than a year ago, and has been dry and solid until last week, when mushrooms began to push through and finally break the bituminous rock. Half a dozen mushrooms have come up since the bumps were first noticed in the flooring, and as many more have raised what look like large pustules in the black surface. Mr. Russell says barley sprouts came up through a portion of the flooring last spring, but he saw no mushroom growth there until about a week ago.

PHOTOGRAPHY APPLIED TO SURVEYING.—Surveyors are becoming more and more indebted to photography for the way in which it facilitates and improves their work. Progress is the order of the day. It is not long since the engineer who used a camera to take occasional or semi-occasional records of the progress of his work was looked upon as putting on airs. Now, however, the blue print and the camera come in very handy, so much so that it is not the engineer who uses them, but rather the one who does not, who is the exception. The engineer is not likely to dispense just now with his transit, but he who avails himself of such help as photography can give him, especially in such work as making close topographical surveys, will have a very great advantage over one who does not.

SINGULAR FACT IN CONNECTION WITH ESSENTIAL OILS.—The composition of all essential oils is one and the same. There is no chemical difference between them. Those of bergamot, birch, chamomile, caraway, hops, juniper, lemon, myrtle, nutmeg, orange, parsley, pepper, saffron, thyme, tansy and valerian, all have the same composition, expressed by the empirical symbol $C_{10}H_{16}$. The widely differing properties of these oils are explained by chemists as due to the different structure, or way in which the atoms are arranged in the molecule, just as the same number of bricks may be arranged to form a house, church, store, or many other different buildings.

STAR SPACE.—There is a photographic chart of the heavens now in course of preparation at the Paris Observatory on which it is calculated that sixty-four millions of stars will be represented—every one in its proper place in relation to all the others. In the nebula of the Lyre a photograph of only 4 by 5½ inches in area has been taken, which represents no less than 4800 stars. All these luminous points are so distinctly shown in the photograph that they may be counted by the naked eye. This is a greater number of stars than can be counted in the entire heavens by the unaided eye.

SUGAR FROM COTTON-SEED.—The latest reported discovery in connection with cotton-seed comes from Germany, where, it is said, a process has been discovered for extracting sugar from cotton-seed meal. The sugar is of a very superior grade, but cannot be sold in competition with the ordinary article. It is said to be inclined to ferment or sour, and hence, better in use for preserving fruits. It is said to be fifteen times sweeter than cane sugar and twenty times more so than sugar made of beets.

GEOLOGISTS have proven that the diamond mines of South Africa are located in vents or chimneys varying from 70 to 1500 feet in diameter, a fact which proves that the king of gems owes its origin to subterranean heat.

A LUMINOUS CRAYON has recently been invented to enable lecturers to draw on the blackboard when the room is darkened for the use of the lantern.

GOOD HEALTH.

HEALTH OF THE STATE.—From the circular issued by the State Board of Health for the month of December, 1890, just to hand, it is learned that the number of deaths in the State was 1196 out of an estimated population of 744,109. Of these deaths, 169 are attributed to consumption, 140 to pneumonia, 28 to bronchitis, 63 to diphtheria, 3 to smallpox, 31 to typhoid fever, 84 to heart diseases, 34 to cancer and 28 to alcoholism. The monthly percentage of deaths was 1.67 per thousand, or an annual mortality of 20.04, which is a higher death rate than that of the preceding month, and the highest death rate the State has had since January of last year, when influenza was epidemic. The increased death rate, the report says, was owing to the increase and fatality of diseases of the respiratory organs, including diphtheria and whooping cough. The three deaths from smallpox all occurred in this city. In concluding its report, the State Board of Health says: We desire this month to call the attention of every health officer to the necessity of having all premises containing or having contained cases of infectious disease properly fumigated and disinfected under their supervision, and to discourage or, if possible, forbid the holding of a public funeral in every case of scarlet fever or diphtheria. Day by day we are called upon to record cases of disease contracted in this way. A general law should be passed making it a penal offense to fail to notify the public, by some distinctive flag or notice, of the presence of communicative disease, and any one holding a public funeral where the cause of death is infectious should be severely punished.

HOW TO AVOID CHOKING.—Death by the clogging of the windpipe is an accident liable to happen to hungry persons eating hastily or to children, and calls for the greatest self-control and presence of mind on the part of those who are present. The substance which causes the choking may either be at the top of the throat, at the entrance to the gullet, or lower down. If at the upper part of the throat, prompt action will often remove it, either by thrusting the finger and thumb into the mouth and pulling the obstruction away, or, if it cannot be reached so as to pull it away, a piece of whalebone, a quill or even a penholder—anything at hand—should be seized and pushed down as a probang, so as to force the substance down the gullet. Tickling the back of the mouth with a feather, so as to produce violent retching, will sometimes dislodge it, or a sudden splashing of cold water in the face, which causes involuntary gasping. Should the patient become insensible before relief can be afforded, it must not be assumed for certain that death has taken place, and such remedies as dashing cold water in the face and on the chest and applying ammonia to the nostrils should be continued till medical aid arrives.—*Chicago Herald.*

ACIDITY OF THE STOMACH.—This condition is due to germs, and the cure lies in getting rid of the germs. Germs of fermentation in the stomach produce, first, alcohol, then carbonic acid, and then acetic acid. A person troubled with this form of dyspepsia should be careful to take only such articles of food as do not favor the development of germs, and thus starve them out. Another thing to do is to wash the germs out of the stomach by drinking freely of hot water before meals. If food is put into a stomach already sour, of course fermentation will be set up immediately. Some persons notice that as soon as they eat, their stomachs become sour. The third important thing to do is to stimulate the stomach to make more gastric juice, which is a natural antiseptic, and prevents fermentation, and also hastens absorption. The glands may be stimulated by applying hot fomentations to the stomach for half an hour immediately after the close of a meal, or easier still, by wearing a rubber bag filled with hot water directly over the stomach for half an hour or an hour. Heat is a natural stimulant, and there are no possible ill effects from its use in this way.—*Good Health.*

PRECAUTIONS AGAINST CONSUMPTION.—In a circular on precautions against consumption, published by the State Board of Health of Pennsylvania, the following advice is given: The duster, and especially that potent distributor of germs, the feather duster, should never be used in a room habitually occupied by a consumptive. The floor, woodwork, and furniture should be wiped with a damp cloth. The patient's clothing should be kept by itself, and thoroughly holed when washed. It need hardly be said that the room should be ventilated as thoroughly as is consistent with the maintenance of a proper temperature.

INTELLECTUAL WORK.—"It is not intellectual work that injures the brain," says the *London Hospital*, "but emotional excitement. Most men can stand the severest thought and study of which their brains are capable, and he none the worse for it, for neither thought nor study interferes with the recuperative influence of sleep. It is ambition, anxiety, and disappointment, the hopes and fears, the loves and hates of our lives, that wear out our nervous system and endanger the balance of the brain."

USEFUL INFORMATION.

The Keely Motor Controversy.

The controversy concerning the Keely motor has been more or less ventilated in the newspapers lately, but generally in a rather misleading way. The following are the actual facts in the case, furnished from what appear to be authoritative sources: Mrs. Clara Jessop Moore, a wealthy lady of Philadelphia, has taken a great interest in Mr. Keely's experiments, not because of any monetary interest in the company, but because of her belief that Mr. Keely's work might prove to be of great scientific value. For some time she has personally furnished all the funds necessary for carrying on Mr. Keely's experiments and supporting him and his family. The stockholders of the Keely Motor Co. desire financial results first and care nothing for the scientific aspect of the case. They desire Mr. Keely to continue to work away on his "commercial engine," which has thus far proved such an *ignis fatuus*, and abandon researches into the nature of his unknown force. Mrs. Moore has made, therefore, the following proposition to the company: That they shall cease all interference with Mr. Keely and permit him to pursue his experiments under the direction of Prof. Hertz of Bonn University, Germany, who is among the foremost of living physicists; Prof. Fitzgerald of Trinity College, Dublin; Prof. Barker of the University of Pennsylvania, and other noted scientists whom Mrs. Moore has interested in Mr. Keely's work. If they will do this until such time as Mr. Keely's work can be placed on a sound scientific basis, Mrs. Moore agrees to furnish all funds necessary for the experiments.

It is greatly to be hoped that the managers of the Keely Motor Co. will have common sense enough to accept this magnificent offer; for there is small hope of the commercial success of their company unless the experiments which Mr. Keely now blindly performs are placed on a scientific and intelligible basis, provided this is possible.

Another Statement.

Notwithstanding the above, the following is another statement quite the reverse: Mrs. Moore, who, since the capital of the Keely Motor Co. gave out, has been supplying funds to the inventor with which to perfect his invention, now proposes to retire from the concern, and Keely will have to look around for some other means of earning an honest living. It is now 20 years since Keely announced to the world the discovery of a new force, with which he was going to revolutionize the whole system of propulsion and locomotion, and even Mrs. Moore cannot be blamed if her confidence begins to move.

Keely's Rival.

The little town of Weston, W. Va., claims to have a mechanic who has invented a machine which rivals the famous Keely motor. It is claimed that a system of mechanism has been discovered by him, whereby one man with a 14-inch lever can create five-horse power. This is equivalent to raising 33,000 pounds five feet high in one minute, or to raising 165,000 pounds one foot in one minute, or in the same length of time to raising 1000 pounds 165 feet high. It is equal in power to raising a one-pound cannon-ball at 30 miles a minute, or double the speed of a rifle-ball.

The machine is now on exhibition in a shop at Weston, where, those who have seen it say, it keeps a rip saw which requires five-horse power in steady operation. The inventor claims that the force can be applied instantly to any object, making it useful for throwing projectiles.

ELEPHANT'S HIDE.—The tanning of elephant's hide is comparatively a new industry. The method employed is practically the same as in the tanning of cow hides, except that a stronger combination of the tannic ingredients is required, and a greater length of time, about six months, is necessary to perform the work. When the hide is taken out of the vat, it is about 1½ inches thick. Articles made of elephant's hide are expensive luxuries. A small pocket-book made of elephant leather, without any silver or gold ornamentation, costs about \$40. A small satchel made of the same leather costs anywhere from \$300 to \$400. Cigar cases, card cases and similar articles vary from \$52 to \$100. Floor rugs are also made out of the leather. In finishing the hide no attempt is made to glaze or polish it. Everything is done to preserve its natural color and appearance. It is a very durable leather, several years' wear having but little effect on it. The scarcity of elephants and the great expense entailed in the tanning of their hides precludes the possibility of elephant leather ever becoming a thing of popular and general use.

A RAILROAD SAFETY CAR.—A new invention is that of a collapsible railway car in which the principle of air-cushions is applied to prevent dangerous accidents in case of collisions. The car will be in two compartments, one larger than the other and empty, so that when a collision occurs the smaller section will be forced into the larger, the air in which will act as a cushion and relieve the occupied section of the sudden shock.

A NEW USE FOR HOPS.—A new use is reported to have been discovered for English hops—namely, for the curing of bacon. It is

found that a sprinkling of hops in the brine when bacon and hams are put in pickle, adds greatly to the flavor of both, and enables them to be kept for an indefinite period.

ENGINEERING NOTES.

Some Ancient Engineering Feats.

The hard mechanical training necessary for an engineer of the present day disinclines him to spend his scanty leisure in studies which cannot be turned to account. The result is that he conscientiously believes his art to be the special flower and glory of the age—in which he is not altogether wrong; but beyond that he regards all earlier feats of engineering as unworthy of serious discussion, and the public, as ignorant, with less excuse, encourage this view.

It is waste of time to ask him how the bowlders of Stonehenge were conveyed to their resting-place, how the walls of Fiesole or Mycenae were built. These marvels represent the power which lies in the brute force of multitudes, and there's an end of the question. Engineering now is an art and a science, with which the rude work of the savages has no sort of connection. One must not inquire why he takes it for granted that Stonehenge, for example, was built by savages, where the brute multitude came from, how they subsisted on Salisbury Plain, or why it is necessary to assume that they were unacquainted with mechanics.

All that is beyond dispute. If you cite records of antiquity which tell of works he cannot rival, that fact alone is proof that the record is a lie; for how can it possibly be that mere Greeks and Romans should have been able to do what the builders of the Eiffel Tower and the Forth Bridge cannot accomplish? We had an amusing instance of this feeling lately. The ingenious M. Eiffel and the artistic M. Bartholdi have been gravely pondering the Colossus of Rhodes—measuring and weighing it as per description, and they conclude that the thing was simply impossible.

It could not have been set up, to begin with, and when set up it could not have stood the pressure of the wind. This is demonstrated by all the rules of modern science, and he who does not admit the demonstration must be prepared to show that two and two do not make four. Those antique personages who professed to have seen the Colossus were victims of an ocular delusion or flat story-tellers, and that greater number who mentioned it incidentally, as we might mention the ruins of the Colosseum, were credulous gossips. The fact is that Messrs. Eiffel and Bartholdi argue in the fashion usual with engineers. Not all of them would pretend that they know every law of nature which applies in such a case. But very few would listen patiently if it were urged that the ancients knew some laws with which they were unacquainted.

So it appears, however, to the disinterested student, and we can bring forward evidence enough. If it be true that the Colossus of Rhodes is really proved "impossible," according to the best modern authorities, this is a good illustration to begin with, for its existence is as well authenticated as the temple at Delphi and the statue of Olympian Zeus, or the Tower of London for that matter, to one who has never seen it. By some means it was set up, and by adaptation of some natural laws it was made to stand until an earthquake overthrew it. One is embarrassed by the number and variety of illustrations to the same effect which crowd upon the mind. Since the Colosseum has been mentioned, we may choose examples of this class. Is M. Eiffel prepared to put an awning over Trafalgar Square when the sun shines, and remove it promptly without the aid of a central support or steam engine, or even chains? The arch of the Colosseum is certainly not less. This may seem a trifling matter to the thoughtless, because they have never considered it. Roman engineers covered in that vast expanse with some woollen material, and they worked the ponderous sheet so easily and smoothly that it was drawn and withdrawn as the sky changed. The bulk of it must have weighed hundreds of tons, all depending by ropes from the circumference. But the ancients thought so little of this feat that they have left us only one trivial detail of the method.

So Julius Caesar stretched an awning above the Forum Romanum and a great part of the Via Sacra in the space of a single night. Have any of our modern engineers pondered the contemporary descriptions of Alexander's duhant tent before Babylon? That, again, appears to have had no central support. It was upheld, says Phylarons, by eight pillars of solid gold. Of the glorious plenishing within we have not to speak, since our theme is mechanics. Around the throne and the great courtiers stood 500 Macedonian guards; in a circle beyond them 500 Persian guards; beyond these again, 1000 archers. To fix a tent which held 2000 soldiers on duty, with arms and accoutrements, surrounding, in successive circles, the most gorgeous Oriental court that ever was, with hundreds of satraps, councilors, generals, eunuchs, and slaves, would perplex a mechanician of the nineteenth century. He will reply that the story is false—must be because he could not match it. Happily the awning of the Colosseum stands beyond dispute, and Alexander's tent is a small matter compared with that.—*St. James's Gazette.*

ELECTRICITY.

Danger From Underground Wires.

According to the views of some of our foremost electricians, says the *Sanitary Plumber*, trouble is likely to result from the hurrying of the electric conductors, if the high-tension currents are still employed. No insulation has yet been discovered that will remain for a long time intact and perfect, and it is pointed out that the ordinary insulating materials are likely to prove very short-lived when exposed to the effects of warmth and moisture in an underground conduit. It is proved by the frequent explosions that have occurred to be rendered additionally destructive by the presence of a large proportion of carburated hydrogen.

We are told that the rapid decay and disintegration of the insulation will enhance the dangers liable to result from an accidental contact of live and dead high-tension and low-tension current conductors, and that the line-men's perils will be aggravated greatly owing to this cause, and by reason of the confined space they will be compelled to work in. Gas that may escape into a conduit is almost certain to be ignited in short order, and the dangerous explosions that have startled the city (New York) are liable to increase in frequency. Worse than this, however, is the warning uttered by a leading electrical engineer, who calls attention to the fact that the escaping current of electricity is as likely as not to find in a water or gas main an avenue of escape, with the result of unpleasantly surprising any one touching branches of these conductors in turning on gas or water.

It is not our wish to pose as alarmists, but we quote pertinent facts that appeal to every citizen. If these currents prove so tremendously effective above ground, where they are, practically speaking, out of every one's way, what is to be said of their presence under our feet and in close contact with metallic conductors in constant use, that may possibly become charged with their deadly energy? It may be all very well to hurry the wires down from the poles, but before placing them where they may prove equally or even more dangerous, their location should be the subject of the most careful attention.

New Uses for Electricity.

Electrical science, says Prof. Elisha Gray, has made a greater advance in the last 20 years than in all the 600 historic years preceding. More is discovered in one day now than in a thousand years of the Middle Ages. We find all sorts of work for electricity to do. We make it carry our messages, drive our engine, ring our door-bell, and scare the burglar; we take it as a medicine, light our gas with it, see by it, hear from it, talk with it, and now we are beginning to teach it to write.

We give the following as among the latest devices in this direction: A Frenchman has perfected a contrivance which acts at once as a mosquito-bar and exterminator. It consists of fine copper wire woven so close as to exclude the insects from the bed. At the top of the canopy hangs a small electric lamp. This attracts the mosquitoes to the netting, where they are killed by a current from a weak pile battery under the bed, which also supplies the light.

A Riverside man has arranged an electric frost alarm which will be a great convenience to orange-growers. It consists of an accurate dial thermometer, electrically connected with a bell and switch in such a manner that it will cause the bell to ring when any desired temperature is reached.

The very latest item in this direction is that it is claimed that hogs should be killed by electricity, because the passage of the current not only kills the pig but kills trichinae at the same time. Whether this claim has any foundation in fact, we cannot say; but it seems plausible. If substantiated, the discoverer should be canonized as a great benefactor of the human race, and deserves of Congress a gold medal for a clear-cut solution of the international question raised by the American pig.

ELECTRIC RAILWAYS IN COLORADO.—Denver has already 30 miles of electrical street road in operation, employing an aggregate of 1150-horse power of generators, 58 motor cars, each fitted with two 15-horse power motors and 60 trailers, traversing the city and reaching out in every direction to suburban points. The old cable and horse-car companies are rapidly adopting what is apparently to be the motive-power of the future for all city and suburban traffic. The West End line uses double-truck cars 40 feet long and of 2000 pounds weight, fitted with two 15-horse power Sprague motors, this motor and overhead wires being in general use on all the lines. The Colorado Springs electrical main line, with branches, is 22 miles long and runs to Colorado City, the former capital of the State. The aggregate power of the generators of this line is 280 horse, employing 18 motor cars and a like number of trailers. Several new lines are in contemplation, and some in process of construction. All the lines are working well. Colorado leads the Union in this enterprise. San Francisco cables are doing well, but there is talk in some quarters of substituting electricity for steam and cables.

Passing Events.

Representatives of the hydraulic-mining interests have visited the Governor of the State and congratulated him on the sentiments expressed in his message. Their address is printed elsewhere in the PRESS. It would really seem as if the time had come when Congress will be forced to give attention to the question affecting this class of mining.

Miners should note that Congress is again amending the mining laws, and if there are objections to the bill now pending (published in another column), they should be made known at once.

One of the local foundries—the Occidental—has withdrawn from the Manufacturers' Association and has again employed union molders. It is not expected that this action will make any change in the status of the strike as far as the other foundries are concerned.

THE MULATOS MINE SUIT.—This matter has been settled. Hohart and Hayward get back \$1,422,000 of the purchase money (\$1,575,000) and reclaim all the output of the mine since the sale, in lieu of which they surrender the Mulatos mine to the Agnayo, who still retain \$153,000, which could not be reached by attachment.

Opals in Washington.

A discovery of opals has recently been made near Moscow in the State of Washington, close to the Idaho line. A number of the gems have been brought to this city and cut, showing a more brilliant play of colors than those obtained from Mexico. They are whiter and without the yellowish tinge of the Mexican gem. Some of them appear to be harlequin opals on which the patches of color are made angular and variously tinted but evenly distributed. Others show deep-green flashes of color, like those called lechoses by the Mexicans. One, a very large specimen, has been examined by a very skillful lapidary, and other competent parties, who are of opinion that it was the largest and most valuable precious opal in the rough that has been brought to this city.

The recent find was made in a wheat-field where men were digging a well, and at a depth of four feet they came upon this deposit. Specimens have been shown to us by Melville Attwood of this city. Specimens of basalt wacke, the inclosing rock, or matrix of the opal, came with the gems. Mr. Attwood has prepared a section of the matrix for microscopic examination by which he identified the substance.

No special work has been done on the claim this winter, owing to the snow, so that the extent of the deposit is unknown. Some of the gems are quite large and pure; and, in fact, all of them are of very good quality and quite handsome, excelling in beauty and luster those from Mexico.

Most of the opals come from Hungary, Honduras, Mexico and Queensland. Those from Hungary are the finest and most valuable. The Honduras mines are little worked, and the opals seldom reach the market. The opals of Mexico are well known throughout the world, although they do not rank in value or durability with those from Hungary.

It is not generally known that there are several places in the United States where opals have been found, most of them, however, small, colorless, and of little value as gems. Mr. G. F. Kunz, gem expert of Tiffany & Co.'s, New York, in his recently published work on "Gems and Precious Stones," speaks of opal showing a brilliant play of rainbow colors, either of the noble or fine opal variety, having been observed in the United States only, near John Day river, Crook county, Oregon. The specimen found there is transparent, grayish-white in color, with red, green and yellow flames. The play of colors equals in beauty any Mexican material, and it is the first opal found in the United States that exhibits color.

Mr. Kunz says that this strikingly resembles and has the absorptive properties of tabasheer, the variety of opal which is formed in the joints of the bamboo and which is used in India for medicinal purposes. "Undoubtedly," he says, "better material of the same kind exists where this is found."

A beautiful fire opal without any opalescence occurs in a small vein about one-fourth inch thick and two inches square from Washington Co., Ga. Common opal in small masses of greenish and yellowish-white color, with vitreous luster, are found at Cornwall, Pa., also at Aguas Calientes, Gibson Gulch, Idaho Springs, Colo., of a brownish color.

Prof. Wm. P. Blake, in his catalogue of California minerals (1866), wrote of a rich white variety of opal found at Mokelumne Hill, Calaveras Co., Cal., and on Stockton Hill, Chile gulch, opals were found in a thin stratum of red gravel at a depth of 345 feet. These stones were thought to have a market value, but really had none. A milky-white variety similar to these and without fire is found 30 miles south of Mt. Diablo, Contra Costa Co., also in the foothills of the Sierra at the Four Creeks.

Nothing, however, with the opalescent luster and fire of these Washington opals has, as far as we are informed, been found before in the United States. As to the extent of the deposit, that is yet to be determined.

Opal is a native amorphous hydrated silica, the same mineral as quartz with the addition of six or seven per cent of water. It is never found in a crystallized form, occurring in masses having a conchoidal fracture. It has a vitreous luster, sometimes inclining to resinous or pearly, and white, green, yellow,

brown or gray color, according to the foreign substances present. Hardness, 5.5-6.5; specific gravity, 1.9-2.3.

The varieties of opal are distinguished according to their color and other physical properties. Precious or noble opal, like the Washington, is generally white or colorless and exhibits a rich play of colors—green, red, blue and yellow of various shades. When large and exhibiting its iridescence in perfection, it is a very valuable gem. Fire opal is a transparent opal colored by hyacinth-red to honey and wine-yellow by ferric oxide; occurs at Zimapan, in Mexico. The common opal is of various colors, but without iridescence. The formation of opals is due to the solubility of amorphous silica in water, especially in hot water, containing carbonic acid, the silica being dissolved out by spring-waters from decomposed silicates and deposited under favorable circumstances in a state more or less approaching to purity.

Suburban Railroads.

Numerous franchisees for street railroads have recently been granted in this city and a number of extensions and changes on old lines have been arranged for. Means for rapid transit of an improved order are in demand as the suburban districts become more populous. The Market-street cable system, including the Geary and Turk street lines, has been granted franchisees of extension which will open up new residence areas or at least offer rapid transit to many blocks that do not now have it.

More attention is being turned to electricity as a motive-power, especially for outside suburban districts, as comparatively high speed can be attained with these cars. In cities in the East, especially the smaller ones, electric cars are largely in vogue and many horse lines are changing to electricity. Once outside a crowded thoroughfare, the electric cars can run quite rapidly. There is, however, much objection to the overhead wires which seem to be necessary to make these roads successful. The storage-battery systems are not as successful as hoped for, and where the wires have been placed underground, great difficulty has been experienced.

While several electric roads built in this State were failures, there is no reason that those of the future should be, since such a large number of them are operating all right elsewhere. All our cable roads here work satisfactorily, but there are instances of failure with these elsewhere. Lack of experience of the construction in such cases was the probable cause of failure.

The electric cars, even in such crowded thoroughfares as exist in Boston for instance, run in a perfectly satisfactory manner, and some of the present horse-car lines in that city will soon change to electricity. The cars can run very slowly or very fast, as occasion demands.

In some of our outside districts we might well follow the example of the Pittsburg cable roads. They have a cable running six miles an hour in the city proper, but on reaching the suburbs they change to another cable running 12 miles an hour. On this faster cable the cars only stop at certain stations, say two blocks apart, and one cannot well jump on or off while the cars are in motion. But by the system of two cables of different speeds, rapid transit for suburban places is attained.

As San Francisco, Oakland, San Jose, Sacramento and other cities of this vicinity grow, better means must be provided for the quick transportation of the inhabitants from place to place. Los Angeles is well provided in the matter of street transportation, its cable system being very perfect and extended. San Francisco, too, has a fine system of street transportation, but it needs outward extension. Oakland needs several more street railroads, and a few additional cable and electric roads have been planned or are being completed. The electric roads are more cheaply constructed than the cable, and it is likely that numbers of them will be built in this State in the future to accommodate the citizens of suburban localities. In time, probably, the overhead-wire nuisance will be abolished and some other plan of handling the electric current perfected.

In the work of draining the Gold Hill mines the Dow pumps are raising to the Sinto tunnel level 1000 gallons of water per day.

The Boston & Montana Co.

(Concluded from page 49)

whom the principal responsibility rests, is a native of England and has followed mining from childhood, first in the place of his birth, then in the Lake Superior copper mines, then in California—both gold and quicksilver—and from thence to the White Pine excitement, where he was in charge of the Hidden Treasure mine. After spending several years there, he emigrated to Utah, where he superintended several mines, and in 1881 he first visited Montana, and being favorably impressed, he decided to cast his lot here and take the chances of being successful. For several years he followed the examination and reporting on properties for the benefit of foreign investors, and by his fair and impartial judgment in this was quite successful in placing a number of good properties. In 1887 he made a report of the properties now included in the Boston and Montana company's mines, and was invited to take the management, which he consented to do. Since that time he has been indefatigable in his efforts to place the company's properties and plants in a proper shape to produce silver and copper at a profit. Every mine the company is operating is directly under his personal supervision, and with his life-long experience, he is familiar with every detail that he may come in contact with. In his responsible position this enables him to be completely master of the situation and capable of filling his important position even in the most minute details.

Mr. Couch has, during the past year, purchased and stocked one of the finest ranches in the State of Montana. His original investment in this was about \$50,000. This he has about doubled by adding thoroughbred stock. This property is on Sun river, a short distance from Great Falls.

The Boston & Montana Company, although only three years old, has already a dividend record that they may well be proud of. It started with a capital stock of \$2,500,000, and now at the end of the third year they have standing to their credit, notwithstanding the fact that they have been making large additions to their permanent improvements, and have been continually operating a large force on development work, \$1,300,000 in dividends. What mine in the country can produce better evidence of careful, shrewd, economical, painstaking management? Their large additional plant will greatly increase the general magnitude of the company's work, as 1000 tons of ore to be mined and shipped, in addition to what is already being mined, will mean a large increase in the force all around; and the activity that will of a necessity come from this will still further develop the capabilities of Butte mines. The stockholders of this property are showing their confidence in the continuity of the mining interests of Butte by investing a portion of their capital in local enterprises. The Lewisohn Bros. of New York purchased the J. M. Bowes lot, when the fire that came near consuming the city of Butte, on the 30th of September, 1889, originated, and now have an elegant block well under way, to be five stories in height, and on its completion will start a banking business. This all carries the inference that the developments on their explorations have been eminently satisfactory, and that it is their intention to bid for a portion of the magnificent future ahead of the "greatest mining camp on earth" in commercial lines, and thus profit by the reinvestment in Butte of a portion of the handsome dividends derived from the stock of the Boston & Montana Consolidated Copper and Silver Mining Company.

The Old Dominion Copper Co., Arizona, produced 7,720,015 pounds of copper, the largest amount ever turned out in one year. They smelted 27,885 tons of ore and used 7880 tons of limestone. The large compound Worthington pump has been started, so they will now more easily handle the water.

JUDGE HAWLEY of the United States Circuit Court has imposed a fine of \$5000 on the Omega Water and Mining Company for disobeying an order of the court by washing debris into the Sacramento river.

FRANK HAMMOND was killed in the Occidental mine, Virginia, Nev., on Wednesday. He was drilling where there was an unexploded "hole" the charge in which went off.

Frame-Work for Cable Railways.

Mr. Patrick Noble, Supt. of the Pacific Rolling Mills, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a novel construction of the yokes or frame-work by which the rails and slot-irons of cable railways are supported and united. In the accompanying drawings, Fig. 1 is a perspective view of a section of the railway, showing the invention; Fig. 2 is a transverse section; Fig. 3 is a plan view of the same in section; and Fig. 4 is a transverse section, showing a modification.

In the construction of cable railways, it is customary to unite the lines of track upon which the wheels travel and the parallel irons between which the slot is formed through which the grip-shank passes from the cars, by iron yokes made in various ways, said yokes being strongly braced and stayed, so as to maintain the tracks and slot-irons in their relative positions. In the ordinary construction these yokes are quite expensive, and Mr. Noble's invention is intended to reduce the expense of this construction. Each yoke is made as follows: *AA* are two angle-irons having sufficient length, so that when set up vertically they will extend from approximately the level of the top of the slot-irons to the bottom of the trench in which the cable-tube or tunnel is formed. *BB* are slot-irons which are secured to these vertical angle-irons by angle-pieces *CC*, bolted to the sides of the slot-irons and also to the vertical angle-irons *A*. The slot-irons *BB* are also shown in the present case as being made of angle-iron of sufficient thickness to give the necessary rigidity.

DD are the rails upon which the cars run, and these are bolted or secured to the chairs *E*, which chairs are in turn secured to the ends of the horizontal bars *F*. These bars *F* have their inner ends adapted to support the lower edges of the slot-iron and bolted to the vertical angle-iron bars *A* so that the two bars are united together. These frames are set transversely to the line of the track, at short intervals, and are solidly embedded in the concrete which forms the continuous tube or channel in which the rope or cable travels. For cheap construction, these are all the parts that are employed, and a continuous body of concrete *G* is filled into the trench so that the vertically arranged angle-irons *A* and the bars *F*, which connect these irons with the chairs upon which the track rests, are entirely embedded in the concrete. The flanges of the angle-irons *A*, which are parallel with the line of the cable tube or tunnel, are of sufficient width so that a considerable quantity of concrete surrounds them, and the transverse flanges are of such width that a considerable body of the concrete lies between the first-named flanges and the inner sides of the tube or tunnel, which is formed of the concrete. This body of concrete is of sufficient thickness to hold the vertical angle-iron *A* firmly in place after the concrete is set, and the whole forms a rigid and immovable structure which is sufficient for all the traffic of cars.

To increase the strength of yoke, chairs *E*, which support the tracks, may be connected with the lower part of the vertical angle-iron *A*, by diagonal braces *H*, which are firmly riveted to both, and taken in connection with the horizontal connecting-bars *F*, they form a strong triangular frame.

In order to still further strengthen the structure, the inventor shows one or two bars, *I*, which extend horizontally between the uprights *A*, to which they are strongly bolted or riveted below the line of the bottom of the concrete-tube or tunnel, so that when the concrete is filled in around the structure or frame-work these irons are all embedded in the concrete and form with it a solid and unyielding structure, which is capable of resisting any strain which is liable to come upon it. By this construction Mr. Noble greatly cheapens the road-bed and reduces the expense very materially, while producing a strong and permanent way.

It is asserted that quite \$2,000,000 was expended last year in making improvements on the Anaconda property in Montana. Notwithstanding, the four men who have an interest in the mine had \$3,500,000 to divide between them. It is estimated that this year the earnings will not fall short of \$5,000,000.

The rolling-mills of the Judson Iron Works at Oakland have closed down for repairs.

THE LATE DAVID KALAKAUA, KING OF HAWAII.

Death of the Hawaiian Sovereign.

On the afternoon of Thursday, Dec. 4th, the U. S. warship *Charleston* arrived in the Bay of San Francisco bearing David Kalakaua, King of Hawaii, as a visitor to California, and on Thursday afternoon, Jan. 22d, the same vessel departed, bearing his body to Honolulu. He came on invalid seeking recreation and hoping to find also restoration. He was received with marked hospitality, and, as far as his strength allowed, accepted and enjoyed the

as the Kingdom of Hawaii. He was a little over fifty-five years of age, having been born November 16, 1836. He was a son of Kapaakea and Keobokatoe. February 12, 1874, he was elected king.

King Kalakaua was brought more prominently before the people of the United States by his visit to this country in 1876, when he was well received by President Grant and by citizens generally. The object of this visit was to promote friendly relations with the United States and to secure the ratification of a Treaty

YOKES AND FRAME-WORK FOR CABLE RAILWAYS.

welcome extended to him as the representative of our neighbor nation in the Pacific. But his malady was evidently too deep-seated for cure; he became worse instead of better, and died on Tuesday afternoon, Jan. 20th.

The portrait upon this page gives a representation of this distinguished personage. He was the seventh ruler of what is now known

of Reciprocity by the United States Senate, in which he was successful. In 1881 King Kalakaua undertook a tour of the world, for the purpose of establishing pleasant relations with foreign Governments and to secure their consent to the emigration of their subjects to the Hawaiian Islands. This aim was also accomplished, the result being that a great immigra-

tion of Asiatic peoples occurred, and many subjects of Portugal were also introduced. During some years the Hawaiian kingdom developed under King Kalakaua's administration. The latter years of his reign were less peaceful than the earlier.

The State Mineralogist's Report.

The Tenth Annual Report of the State Mineralogist which has just been issued comprises nearly 1000 pages. With it is published a topographical and preliminary geological map of the State. The several most important geological characteristics have been defined on this map in colors, and many of the metalliferous deposits indicated by symbols.

The report includes "Geology of the Mother Lode Region," by Harold W. Fairbanks; "Ancient River Beds of the Forest Hill Divide," by Ross E. Browne; "Lead Smelting," by F. C. Von Petersdorff; "Mining of Gold Ores in California," by John Hays Hammond; "Location of Mines," by R. P. Hammond Jr.; "Introduction of Producer-Gas at the Marsac Mill, Park City, Utah," by C. A. Stetefeldt; "The Colorado Desert," by C. R. Orant; "Quicksilver Mines and Reduction Works," by J. B. Randol (a bulletin of the census); "Gold Extraction by Potassium Cyanide," W. D. Johnston.

In addition to these special articles, a chapter is devoted to the mining interests of each county of the State, this information being derived from notes by field assistants of the State Mineralogist. There is quite a number of illustrations.

This report is the most complete one yet issued by the Mining Bureau, and is supplementary, to a certain extent, to that of last year. The chapter by Ross E. Browne is a most valuable addition to the knowledge on the subject of ancient river beds, that gentleman having had exceptional facilities for observation. Mr. Hammond's article on the mining of gold ores is also a very valuable one, the best on the subject which has yet been published. State Mineralogist Ireland can congratulate himself on having given the mining public a very useful volume.

The Mulatos Mine Purchase.

EDITORS PRESS:—The purchasers of the Mulatos mine were not influenced by my report, made to a different company a year and a half previous, but acted on other advice. The examination was made under written instructions as to the price asked for the property and other matters, and even if my report had been different from what it was, its use, even nominally, was not authorized in connection with a state of affairs which did not exist when the report was written, the underground or main workings of the mine having caved from the surface down to the bottom level some time before the property was bought.

While the general results of the examination seemed to warrant the belief that the property was very valuable, I did not feel called upon to make positive estimates from data which were often not encouraging, and which I did not think sufficient, in view of the very great extent of ground which it was, in many instances, only possible to sample in a superficial manner.

The results of the sampling were not of a kind to excite suspicion at the time that the samples had been tampered with, although the fact seems now to be proven to some extent at least. Several of the small milling tests made in San Francisco of a mixture of equal parts of all the samples from extensive regions, showed a grade of ore which would hardly pay to work; and in other cases it was only by taking on equal terms the high assays from comparatively small areas that better general averages could be obtained. I called attention to this fact in my report.

The persons for whose account the examination was made have not been named, and I know that the recent purchasers were thoroughly cautioned against buying such a property without closer investigation.

ALEXIS JANIN

San Francisco, Jan. 21 1891

MINING COMMITTEES.—The California Senate Committee on Mines, Draught and Mining Debits is as follows: Voorhies (chairman), Fraser, Preston, R. H. Campbell, Mead, Dray, Ostrom. The House Committee on Mines and Mining Interests is composed of Hale (chairman), Lux, Hunewill, Freeman, Baughman, Kellogg, Robertson, Martin, Garver.

INDICATIONS of natural gas have been found three miles from Vallejo, Solano county.

Manufacture of Soap and Candles

A New and Thoroughly Modern Book. The Most Complete and Valuable in any Language.

A PRACTICAL TREATISE ON THE MANUFACTURE OF SOAP AND CANDLES, based upon the Most Recent Experiences in the Science and the Practice; comprising the Chemistry, the Raw Material, the Machinery and Utensils, and Various Processes of Manufacture, including a Great Variety of Formulas. Edited chiefly from the German of Dr. O. Deite, A. Englehardt, Dr. C. Schaeffer and others. With Additions and Lists of American Patents relating to these subjects. By Wm. T. Brannit, one of the Editors of "The Techno-Chemical Receipt Book." Illustrated by 163 engravings. 8vo, 677 pages.....\$7.50

An illustrated circular showing the contents and specimens of the engravings of this valuable book, eight pages, quarto, will be sent free to any one in any part of the world who will furnish us with his address.

ALSO RECENTLY PUBLISHED

BRANNIT—A PRACTICAL TREATISE ON ANIMAL AND VEGETABLE FATS AND OILS, comprising both Fixed and Volatile Oils, etc., as well as the Manufacture of Artificial Butter, Lubricants, including Mineral Lubricating Oils, etc., and on Ozokerite, etc. By Wm. T. Brannit. 24 engravings, 730 pages, 8vo.....\$7.50

An illustrated circular, eight pages, quarto, showing the full table of contents of this book, sent free of postage to any one addressing us.

CREW—A Practical Treatise on Petroleum. By Benj. J. Crew. With an Appendix on the Oil Regions and the Geology of Natural Gas. By Charles A. Ashburner, Geologist in charge Pennsylvania Survey. Illustrated by 70 engravings and two plates, 508 pages, 8vo. Price.....\$5.00

An illustrated circular of this book, four pages, quarto, sent free.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

HENRY CAREY BAIRD & CO.

INDUSTRIAL PUBLISHERS, BOOKSELLERS AND IMPORTERS,
810 Walnut St., Philadelphia, Pa., U. S. A.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot Cut and Slotted Sheet Metal.

Orders promptly attended to.
San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

FRANCIS SMITH & CO.

Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

C. H. EVANS & CO.

(Successors to THOMSON & EVANS),

110 and 112 Beale Street, S. F.

MACHINE WORKS,

Steam Pumps, Steam Engines
and all kinds of MACHINERY.

DEEP WELL
PUMPS

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American finished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/2 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

Union Rock Breaker

For Sale Cheap.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. It contains a series of practical and personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1893. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market Street, S. F.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Cyanide; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 100 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 220 Market St., S. F.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall, Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

A GOLD-MILL SUPERINTENDENT

Of long experience, assayer and practical chemist, desires an engagement, particularly in a mill where gold and amalgam is wasted. The best of references given. Address E. W., 1278 Tenth Avenue, East Oakland.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, ore being 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$825, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin it need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1886.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

[Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

The Bear Valley Arch Dam.

In 1883 work was commenced on the Bear Valley arch dam, in San Bernardino county, and the reservoir formed by the completed structure was filled in April, 1886. The profile adopted is so thin that the dam cannot resist the thrust of the water by its weight, and it owes, therefore, its stability solely to the curved form of its base, which enables the wall to act as an arch. The dam was founded entirely on rock, and was built of granite laid in Portland cement mortar. Its plan is curved, the radius of the down-stream face being 300 feet. The length of the dam on top is about 450 feet. The front face of the wall is vertical and the back face battered.

There is only one other dam of this character in the world, and that is the Zola dam, built to form a reservoir for supplying the city of Aix, France, with water. This dam is built of rubble masonry and circular in plan, the radius at the crown being 158 feet. This dam is unable to resist the thrust of water by its weight alone, and owes its stability solely to its acting as a horizontal arch abutting against the sides of the valley. The Zola dam was built in 1843 and is still standing.

The Bear valley arch dam was designed by Frank E. Brown, C. E., and has attracted great attention from engineers by reason of its peculiar shape and the lightness of construction. It was at first generally condemned as being too light for the purpose, but is now recognized as a piece of bold but successful engineering.

The granite from which the dam was built was quarried near by and roughly squared by a

THE BEAR VALLEY DAM FROM ABOVE.

THE BEAR VALLEY DAM FROM BELOW.

hammer. For the most part these blocks weigh less than one ton each, there being a few larger ones near the base. The blocks were laid in a bed of mortar composed of one-part Portland cement to three-parts of sharp sand. Their ends were placed from one to three inches apart, and the space was filled with broken stone and mortar thoroughly rammed.

The courses are very irregular, or rather there are no courses, the design being to have the works thoroughly bonded in all directions with no continuous seams.

There is but one outlet, which is located near the bottom of the dam, and it consists of an arched opening passing through and closed on the inside by a single cast-iron slide working in brass ways.

The waste weir is located at one side of the solid rock. For allaying the fears of the people in the valley below, a recommendation was made by Prof. Geo. Davidson of this city, to put the waste weir down at least ten feet below its original level, which was done.

The engravings given herewith (for the use of which we are indebted to Mr. L. M. Holt of the *Orange Bell*) show the general features of the Bear valley dam, with many of its details. Mr. J. S. Black, the assistant to Mr. Brown, writes thus concerning the strength of the dam:

"As there is no known instance in which a similar structure has ever been constructed, or even attempted, in which the strain approach to one-half this amount (referring to the 'strain-sheet' submitted by him), the question arises, Is the dam safe? To engineers this is an important question, apart from any consideration of damage that might result from a rupture, because of the effect an affirmative answer would have on all future practice in the

NUMBER XXVII.

[Written for the PRESS by JAMES H. CROSEMAN.]

Death Valley and Surroundings.

The configuration of Death Valley resembles the letter "S." From Salt Springs on the south to Saratoga Springs on the north end of the valley, the distance is about 12 miles. From these springs it extends in a northwesterly direction for several miles, running thence northerly, finally taking a sweep around to the southward.

About a mile and a half northeast from the Salt Spring mines, sand-dunes have formed a complete barrier across the former confluence of the Mojave and Amargosa rivers. From the present mouth of the Amargosa river to the Amargosa horax-fields the distance is 16 miles. From the same point to McLean's ranch, the distance is 15 miles.

The river-bed proper on its southerly course consists mainly of beds of gypsum, nitrons earth, tufa-beds, sandstone and clay banks, all containing more or less soda, with an occasional deposit of gravel in the beds of water-courses.

From McLean's ranch through the canyon for a distance of 12 miles, about 100 inches (miners' measurement) of water flows on the surface, sinking finally into the desert sand. McLean's ranch is situated on the northerly slope of the hills surrounding the horax-fields.

From the summit of Cave Springs, 30 miles northwest of Garlic (see Article No. VII) to Saratoga Springs in Death Valley, the distance is 13 miles, with an average descent of 303 feet to the mile—a total of 3939 feet. Between Cave Springs and the mouth of Amargosa river, a distance of 18 miles, stretches a waste of sand which shifts about in the fitful gusts of wind or is driven before the blast of a heavy storm.

Saratoga Spring, in all probability, is the outlet of some subterranean channel or reservoir, as its waters are filled with fish—of what species, the Government expedition will have an opportunity of determining. This place is the resort of great numbers of ducks of several varieties.

The spring's basin is about 12 feet in diameter, nearly circular; its water flows upward with such force that a bather cannot sink deeper than his chin, though the feet find nothing more substantial to rest upon than bubbling quicksand. The water averages during the day 92° F. and is slightly alkaline. The spring overflows, forming a small running stream, in which grows a dense mass of tules, flags and aquatic plants. Horseflies, gnats and mosquitoes are abundant—a torment alike to man and beast. We are now in the vicinity of that portion of Uncle Sam's territory (Death Valley) about which so many sensational stories have been published that the Department of Agriculture of our Government has organized an expedition to explore these regions for the ostensible purpose of obtaining some knowledge of its flora and fauna. It is reported that the expedition will consist of two parties—one under Vernon Bailey and the other under Prof. T. S. Palmer. These parties start at opposite points, approaching each other and meeting eventually in Death Valley.

Every schoolboy in the country is aware that Death Valley is about the last place on earth that one would select as a suitable locality to carry on agricultural pursuits. It is to be hoped, however, that the knowledge gained by these learned gentlemen of the expedition will be of such a character as will prove beneficial to the commonwealth in a practical way.

The fauna of the valley is confined to but a few species, and to any but the bug-hunter is uninteresting and of but little value, consisting of an occasional jack-rabbit, rattlesnakes, horned toads, lizards, and insects all of well-known species; but this is not the class of fauna sought for to supply the table of the *bon vivant* or even that of the hungry prospector or pot-hunter.

The springs and other sources of water supply, however, are of vast importance to the desert traveler, and it should be a portion of the work of the expedition to build monuments at these important places and to erect guide-boards in order to properly direct the wandering traveler to these sources of the aqueous fluid, showing their direction and indicating the distance. It is all-important, too, that the geologist and mineralogist should accompany the botanist and naturalist, as it is possible there is no portion of the public domain of the United States where valuable mineral deposits occur in greater abundance or possess greater prospective value than the desert regions. Without these adjuncts the expedition will prove a failure and of no benefit. Painted pictures and colored maps are not what our people want. We want something practical and solid. Prof. Whitney published volumes on the geology of California, but forgot all about its mines and mineral resources. What this isolated section requires is fuel and water; with these two important adjuncts, the desert region would become one of the most productive mining sections in the United States. Water can be easily obtained by artesian wells from subterranean channels as well as from springs when properly developed.

The development of subterranean water is too

great an undertaking for individual capital, but is it not within the province of the General Government to do this very thing? Such a course will not only promote our mining industry but will reclaim what is now a barren unproductive desert. In that event it would be not only a profitable field for the miner but the agriculturist as well.

The mountain country around Death Valley lies in the form of a triangle.

The Funeral range, whose greatest elevation is 6754 feet, lies on the east with its lava-covered crest extending in an easterly direction for 10 miles and 30 miles westerly to the belted range with a width of 25 miles to the edge of Death Valley. The center of this massive outburst of molten rock is denoted by numerous low-angled coniferous vents bordering the valley on the west. The Panamint range, of which Telescope is the dominant peak, rising to an elevation of 11,047 feet, forms a striking feature and can be seen for long distances. On the northerly borders Chloride Cliff mountain rises boldly with its noticeable white capping; on the south the Black Butte, an isolated peak, is seen overshadowing this "Valley of Death." This butte, notwithstanding its forbidding appearance, contains several fine springs of pure water, 1½ miles distant from the edge of the valley. The valley varies from 8 to 15 miles in width and is 40 miles long. It lies within that area bounded by the meridian 116° 30', and 117° west longitude and parallel 35° 45' and 36° 30' north latitude. On the south branch, valleys extend southeastwardly and southwardly; the former known as the Amargosa valley, which has a length of 25 miles; the latter, Long valley, 12 miles long. It has been reported and is generally believed that a portion of Death Valley lies below the level of the sea, but this has never been authenticated by any actual survey, and it is a matter of considerable doubt which the new expedition will determine. The line of the greatest depression, however, lies on the eastern side of the valley, and extends northerly and southerly for 15 miles. The lowest depression is a little east of south from the mouth of Furnace creek. The formation surrounding the valley is composed of stratified sedimentary rocks, sandstones and fossiliferous limestone.

(To be Continued.)

The Free Coinage Bill.

The Free Coinage bill, which was passed by the Senate, is substantially as follows:

An Act to provide for the free coinage of gold and silver bullion and for other purposes. That from and after the date of the passage of this Act, the unit of value in the United States shall be a dollar, and the same may be coined of 412½ grains of standard silver or 25 S 10 grains of standard gold; and said coins shall be a legal tender for all debts, public and private; that hereafter any owner of silver or gold bullion may deposit the same at any Mint of the United States to be formed into standard dollars or bars for his benefit and without charge, but it shall be lawful to refuse any deposit of less value than \$100, or any bullion so base as to be unsuitable for the operations of the Mint.

SEC. 2. The provision of Section 3 of "An Act to authorize the coinage of a standard silver dollar, and to restore its legal-tender character," which became a law February 23, 1878, is hereby made applicable to the coinage in this Act provided for.

SEC. 3. That the certificates provided for in the second section of this Act shall be of denominations not less than \$1 nor more than \$100, and such certificates shall be redeemable in coin of standard value. A sufficient sum to carry out the provisions of this Act is hereby appropriated out of any money in the Treasury not otherwise appropriated. So much of an Act of July 14, 1890, entitled: "An Act directing the purchase of silver bullion and the issue of Treasury notes, and for other purposes," as requires the purchase of 4,500,000 ounces of silver bullion per month, be and the same is hereby repealed.

SEC. 4. The certificates provided for in this Act and all silver and gold certificates already issued shall be receivable for all taxes and dues to the United States of every description and shall be a legal tender for the payment of all debts, public and private.

SEC. 5. The owners of bullion deposited for coinage shall have the option to receive coin or its equivalent in certificates provided for in this Act, and such bullion shall be subsequently coined.

THE first silver dollars bearing the date of 1891 were coined Monday in the United States Branch Mint in this city, and 50,000 will be turned out every day hereafter until July next. The monthly output for January will be \$785,000.

A NEW mining district has been organized on the headwaters of Little Kern river, Tulare county, which is known as Soda Creek district. The ores are of low grade, but free milling. The country is well watered and timbered, and at an altitude of 9000 feet above sea level.

TRUSTEE W. R. ECKART of the Mechanics' Institute states that great interest is being manifested in the freehand and mechanical drawing classes, the former having at present 134 members enrolled and the latter 117.

Mining Corporations.

A Proposed Act for the Protection of Stockholders.

The following is Senate Bill No. 155, introduced by Mr. G. H. Campbell and referred to the Committee on Mines, Drainage, and Mining Debris:

An Act to amend an Act entitled "An Act amendatory of an Act entitled 'An Act for the better protection of the stockholders in corporations formed under the laws of the State of California, for the purpose of carrying on and conducting the business of mining,'" approved March 30, 1874, in effect April 23, 1880.

SECTION 1. It shall be the duty of the secretary of every corporation formed under the laws of the State for the purpose of mining, and the secretary of any other mining corporation doing business in this State, or of which its shares of capital stock are bought and sold in any stock exchange, to keep a complete set of books showing all receipts and expenditures of such corporations, the sources of such receipts, and the object of such expenditures, and also all transfers of stock.

All books and papers shall, at all times, during business hours, be opened to the inspection of any bona fide stockholder, and if any stockholder shall at any time so request, it shall be the duty of the secretary to attend at the office of said company at least one hour in the day, out of regular business hours, and exhibit such books and papers of the company as such stockholder may desire, who shall be entitled to be accompanied by an expert, and he shall also be entitled to make copies or extracts from any such books or papers. It shall be the duty of the directors, on the second Monday of each and every month, to cause to be made an itemized account or balance sheet for the previous month, embracing a full and complete statement of all disbursements and receipts, showing from what sources such receipts were derived, and for what and to whom such disbursements or payments were made, and for what object or purpose the same was made. Also, all indebtedness or liabilities incurred or existing at the time, and for what the same were incurred, and the balance of money, if any, on hand. And it shall be the duty of the directors to cause to be made a complete and accurate survey of the mine, together with maps or diagrams, showing such surveys; and such surveys shall be made just prior to each annual election, and the maps or diagrams shall accompany the annual report of the superintendent, and be posted in the office of the company for the inspection of all stockholders. Such account or balance sheet, survey, maps or diagrams, shall be verified under oath by the president and secretary, and posted in some conspicuous place in the office of the company. It shall be the duty of the superintendent, on the first Monday of each month, to file with the secretary an itemized account, verified under oath, showing all receipts and disbursements made by him for the previous month, and for what said disbursements were made. It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him, and for what purpose, and the rate of wages paid to each one. He shall attach to such account a full and complete report, under oath, of the work done in said mine, the amount of ore extracted, the car sample assay value of the same, from what part of the mine taken, the amount sent to mill for reduction, the name of the mill, the amount of bullion received, its percentage of the car sample assay, the amount of bullion shipped to the office of the company or elsewhere, and the amount, if any, retained by the superintendent. It shall also be his duty to forward to the office of the company a full report, under oath, of all discoveries of ores or mineral-bearing quartz made in said mine, whether by boring, drifting, sinking, or otherwise, together with the assay value thereof and a copy of all surveys and maps or diagrams made of the workings in the mine since his last report. All accounts, reports, surveys, maps, or diagrams, and correspondence from the superintendent shall be posted in some conspicuous place in the office of said company and be open to the inspection of all stockholders. In case of the refusal or neglect of the superintendent to make and forward to the office of the company the accounts, reports, surveys, maps, or diagrams, provided for in this section, or in case he shall knowingly forward any false or incomplete account, report, survey, map, or diagram, he shall be guilty of a misdemeanor, and it shall be the duty of the directors of such corporation to remove, forthwith, the said superintendent, and thereafter he shall not be employed by any corporation existing under the laws of this State, and no salary shall be paid him, and any stockholder shall be entitled to recover, in any court of competent jurisdiction, against said superintendent the sum of one thousand dollars as liquidated damages.

SEC. 2. Any bona fide stockholder of a corporation formed under the laws of this State for the purpose of mining shall be entitled to visit, accompanied by his expert, and examine the mine or mines owned by such corporation and every part thereof, at any time he may see fit to make such visit and examination; and when such stockholder shall make application to the president of such corporation, he shall immediately cause the secretary thereof to issue and deliver to such applicant an order, under the seal of the corporation, directed to the superintendent, commanding him to show and exhibit such parts

of said mine or mines as the party named in said order may desire to visit and examine. It shall be the duty of the superintendent, on receiving such order, to furnish such stockholder every facility for making a full and complete inspection of said mine or mines, and of the workings therein; it shall be his duty also to accompany said stockholder, either in person or to furnish some person familiar with said mine or mines to accompany him in his visit to and through such mine or mines, and every part thereof. In case of the failure or refusal of the superintendent to obey such order, such stockholder shall be entitled to recover in any court of competent jurisdiction, against said corporation, the sum of one thousand dollars and traveling expenses to and from said mine as liquidated damages, together with costs of suit. In case of such refusal, it shall be the duty of the directors of such corporation forthwith to remove the officer so refusing, and thereafter he shall not be employed directly or indirectly by such corporation, and no salary shall be paid him. [Amendment, approved April 23, 1890; Amendments 1880, 135 (Ban. Ed. 400); took effect from passage; repealed conflicting Acts.]

SEC. 3. In case of the refusal or neglect of the president to cause to be issued by the secretary the order in the second (2d) section of this Act mentioned, such stockholder shall be entitled to recover against said president the sum of one thousand dollars and costs, as provided in the last section. In case of the failure or neglect of the directors to cause said surveys and maps or diagrams to be made, or to remove the superintendent as provided in section one, or to have the reports and accounts, surveys, maps or diagrams made and posted, as is provided in the first section of this Act, within ten days after the refusal or neglect of the superintendent, they shall be liable either severally or jointly to an action by any stockholder in any court of competent jurisdiction, complaining thereof for each and every such refusal, neglect or failure, and on proof of such refusal, neglect or failure, such complaining stockholder shall recover judgment for one thousand (\$1000) dollars liquidated damages, with the cost of suit, for each and every of such refusals, failures or neglects.

SEC. 4. Any bona fide stockholder of a corporation formed under the laws of this State for the purpose of mining may institute an action in his own name, or in the name of the corporation, to recover any and all moneys or property due to the corporation or to the stockholders thereof, and the judgment obtained therein shall inure to the benefit of the said corporation or its stockholders, as the case may be, subject to a lien on said judgment in favor of the plaintiff, for all sums of money expended by him for costs of suit and attorney's fees paid or agreed to be paid by plaintiff; provided, said money expended, costs of suit and attorney's fees do not exceed fifty per cent of the whole amount recovered.

SEC. 5. All Acts and parts of Acts in conflict with this Act are hereby repealed.

Silk in California.

The fifth annual report of the Ladies' Silk Culture Society of California has just been issued and is a document of very great local interest and importance, as it shows the accomplishment of many significant things. In the introductory portion of his report as president, Mr. W. B. Ewer points out clearly the amount of work which has been done with the limited funds entrusted to the board, and argues strongly against a disposition to underrate the accomplishment because, owing to the length of time required to establish a silk station and bring a mulberry grove up to the yield of large quantities of leaves, there have not been large results attained immediately. But Mr. Ewer proceeds to show, and in fact does show incidentally all through his argument, that there has been a vast amount of valuable work done, although the society has been constantly under the cloud of inefficient means to realize its plans and purposes. The items of this showing we have not space to set forth and must refer the student of the progress of silk-culture efforts to the perusal of the report itself. As it now stands, unless Congress shall take special action and restore the item for the Pacific Coast work to the appropriation bill, the Ladies' Society will be thrown again upon its own resources. The injustice of such refusal of Government aid is shown in this forcible paragraph in the report:

"The women of this, our Golden State, joined hands with their sisters in the East, and through wise management and slow but sure progress have demonstrated, beyond the possibility of a doubt, that the United States can produce silk of a quality not excelled by any other nation on the globe. The efforts on both sides of the continent have secured more or less aid from the Government. Their united efforts have reached results in ten years which took the Government of France fully one hundred years of time, and more than ten, probably twenty, times the amount of money that our own Government has expended. A careful and candid observation of the progress which has been made on this coast, we are fully persuaded, will not snuff in any way by comparison with what has been done at the East, even at a much larger expenditure, than has been appropriated for the work in California. All we ask is a slight advance on previous appropriations to carry out our work in full, as already outlined in this report. It is to be hoped that Congress will see the impropriety of with-

holding appropriations from the women of this State while continuing them to their sisters in the East."

The report of the secretary, Mrs. L. E. Pratt, is also a strong showing for the efficacy of the society's work. Incidentally there is given a little glimpse at the desk of the secretary, which shows that it has not been tenantless. We quote:

"Early in the season I was instructed to notify producers that the society would purchase cocoons at prices heretofore paid, receiving them unstuffed and remitting amounts due within 30 days thereafter. This stimulated correspondence, upward of 800 letters having been received and answered during the year, 25 counties being represented in the list of correspondents."

"I have personally superintended the weighing of all cocoons and report 600 pounds purchased, mostly in an unstuffed condition. The quantity would have been largely in excess of the previous year but for the lack of suitable buildings for increased work, and the disease so generally reported among worms from seed last distributed. I am pleased to note the generally improved quality as compared with those of previous years from the same locality. The amount disbursed for the purchase of cocoons appended below has been paid out in sums varying from 73 45-100 dollars to 25 cents."

But though these matters show work and progress, we find in the report of the Experimental Committee an achievement which seems to be beyond parallel and of great local significance.

"The experiment for 1890 was begun at the Piedmont station April 29th, and was made with the seed of the most select variety of silk worms, viz.: the *Frivulami* produced at the station the previous year under the careful supervision of Prof. J. J. Rivers. The hatching was most successful, fully 97 per cent completing the hatch by the fourth day, a result which we believe is without precedent. There being a sufficient supply of the *Mulicautis*, all were fed on this variety until the third molting, when they were separated into three divisions. First division, consisting of the best specimens of the first and second days hatch, were fed entirely on *Mulicautis*, until the time of spinning. The second division, composed of those a little less in size, were fed on the *M. Albi* and *M. Rosa* from the third molt to the time of spinning. The third division, comprising about 1400, the least in size of all, were placed in charge of a lady 81 years of age, and were fed on *M. Albi* alternating with *Nagasaki*, with the result that the second and third divisions made a most remarkable growth, and although a little later in spinning, their cocoons were so nearly the same as to size, weight, etc., of those first spun, as to be indistinguishable, if by accident they were exchanged."

"The result of the experiment fully establishes the superiority of the *M. Albi*, *M. Rosa* and *Nagasaki* for later feeding, and I doubt not if a portion of the most robust worms had been fed on these varieties from the third molting, those cocoons would have excelled the others, but want of room prevented the experiment."

"There were no signs of disease as viewed under the microscope or otherwise, there being less than 25 English worms in the whole brood, which were destroyed, each one of the remainder completing a cocoon within 35 days from the time of hatching."

"The result of the experiment proveth at superiority of acclimated seed over that of imported, in that about 97 per cent successfully hatched, whereas 80 per cent is a good average from imported seed."

"The silkworms from seed produced here were much more vigorous and healthy than those from imported seed; consequently, the loss sustained by disease was very slight, whereas a loss of 20 per cent must be counted on from imported seed."

This record shows that California silkworm eggs have an exceptionally high percentage of life and strength and are vastly superior to the imported. It seems to revive again the hope enjoyed a score of years ago that California might be the supply region of strong, healthy eggs for the silk producers of less favored regions. There is certainly found in the report of the society for the last year abundant evidence that its work should not only be continued but should be extended.

Notes from Calico.

A correspondent sends us the following notes from Calico, San Bernardino county:

"The 75 stamps of the Waterloo Mining Co. are running day and night on ore from the Waterloo and Silver King mines. About 200 tons per day of silver ore are sent through these mills. There is enough ore in sight in both mines to guarantee this output for some time to come."

"The Runover Co. are running their 20-stamp mill on ore from the Oriental No. 2, Red Cloud, Mammoth, Silver Monument and Occidental mines, and have all the ore they can treat."

"The Langtry mine, situated about 2½ miles northwest of the Waterloo mine, discovered by the McShane Bros., has been sold to the Barber Mining and Milling Co. Fifteen men are taking out ore and doing development work. This mine shows every prospect of being a heavy ore-producer in the near future."

"The Barber mill has been closed down for repairs for the past three weeks, but will drop the stamps again in about a week."

Mineral Lands.

Proposed Change in Existing Laws

The House Committee on Mines and Mining has reported to the House, with amendments, the Senate bill which passed the Senate, Dec. 18, 1890, and was submitted to the House next day. It has been in the hands of the committee since that time. The following is the full text of the bill as it passed the Senate:

SECTION 1. That section twenty-three hundred and twenty-four of the Revised Statutes be amended so as to read:

"SEC. 2324. The miners of each mining district may make regulations, not in conflict with the laws of the United States or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground by posts or monuments, so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim. On each lode claim located after the tenth day of May, eighteen hundred and seventy-two, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all lode claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein until payment of the purchase money and a certificate of entry has been issued therefor; and for each twenty acres of placer claims, and for each subdivision thereof less than twenty acres, ten dollars' worth of labor shall be performed or improvements made during each year until payment of the purchase money and a certificate of entry shall be issued therefor. But where several adjoining lode claims, not exceeding five, are owned or held by the same person, association, or corporation, and the sum of five hundred dollars or more is expended in any one year in good faith for the development of all of the claims so owned or held, not exceeding five, there shall be no requirement for separate labor or improvements to be performed or made on the several claims so owned or held during such year. The year within which the annual labor or improvements required to be performed or made by this section shall commence at twelve o'clock meridian on the first day of October of each year: *Provided*, That upon claims located previous to the first day of March in any year, the annual labor or improvements shall be performed or made on such claim for that year prior to twelve o'clock meridian of the first day of October next succeeding; and upon claims located after the last day of February and prior to twelve o'clock meridian of the first day of October in any year the annual labor or improvements required shall be performed or made within one year from twelve o'clock meridian of the first day of the succeeding October: *And provided further*, That only one-half of the annual labor or improvements required by this Act shall be necessary to be performed or made prior to twelve o'clock meridian of the first day of October, in the year eighteen hundred and ninety-one, on claims upon which the annual labor or improvements were performed or made in the year eighteen hundred and ninety; but after the first day of October, in the year eighteen hundred and ninety-one, the full amount of labor or improvements required by this Act shall be performed or made upon such claims as in all other cases during each year prior to twelve o'clock meridian of the first day of October. In case the first day of October falls on Sunday or any holiday, the following secular day shall be construed as the first day of October within the meaning of this Act. When the labor required by this Act shall have been performed or the improvements made, an affidavit may be filed within thirty days after the time limited for performing such labor or making such improvements with the recorder of deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with the conditions of this Act in the performance of labor or making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns or legal representatives do not resume work upon the claim after such failure and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made; but no relocation of a claim by a person who has already located such claim and failed to comply with the conditions of this Act in performing work or making improvements shall be valid prior to such resumption and continuance of work upon such claim. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made

the improvement may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the recorder of deeds of the county in which such mining claim is situated, shall be evidence of the acquisition of title of such co-owners. Where a person or company has or may run a tunnel for the purpose and with the intent in good faith of developing a lode or lodes owned by said person or company, the money so expended in running said tunnel shall be taken and considered as expended on said lode or lodes: *Provided further*, that said lode claim or claims shall be distinctly marked on the surface as provided in this Act."

SEC. 2. That section twenty-three hundred and twenty-five of the Revised Statutes be so amended as to read:

"SEC. 2325. A patent for any land claimed and located for valuable deposits may be obtained in the following manner: Any person, association, or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purposes, who has, or have, complied with the terms of this chapter, may file in the proper land office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States Surveyor-General, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least one person that such plat and notices have been duly posted, and shall also file a copy of the notice in such land office, and shall thereupon be entitled to a patent for the land in the manner following: The register of the land office, upon the filing of such application, plat, field notes, notices and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant at the time of filing this application, or at any time thereafter within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General that five hundred dollars' worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and receiver of the proper land office at the expiration of the sixty days' publication it shall be assumed that the applicant is entitled to a patent, and that no adverse claim exists, and upon the payment to the proper officer of five dollars per acre he shall receive a certificate of entry; and thereafter no objection from third parties to the issuance of a patent shall be heard except if he shown that the applicant has failed to comply with the terms of this chapter. But no more than three thousand feet in length along the vein or claims located prior to the tenth day of May, eighteen hundred and seventy-two, and not more than the extent of fifteen hundred feet in length by six hundred feet in width located after said date, shall be included in the same application for a patent, and not more than forty acres of placer ground shall be included in the same application for a patent: *Provided*, That when fractional claims are located or sought to be patented between other existing claims the end lines may be made to conform to the lines of such adjoining claims."

SEC. 3. That section twenty-three hundred and thirty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 4. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in any State or Territory of the United States or in the District of Columbia having an official seal, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, attested by his seal of office, shall have the same force and effect as if taken before the register and receiver of the land office. In cases of contest as to the mineral or agricultural character of land the testimony and proofs may be taken, under such regulations and notice as the Commissioner of

the General Land Office may prescribe: *Provided*, That the presence of rock in place bearing gold, silver, cinnabar, or other valuable metal, shall be regarded as prima facie evidence that the land containing the same is mineral in character."

SEC. 5. That section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended in good faith to be used or occupied by the proprietor of such vein or lode claim for mining or milling purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately, subject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims; but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superficies of the lode claim. The owner of a quartz-mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill-site as provided in this section."

SEC. 6. Amend section twenty-three hundred and thirty-eight of the Revised Statutes so as to read:

"SEC. 2338. As a condition of sale each patent shall reserve the right of way through or over any mining claims for roads, ditches, canals, cuts, tunnels, and other easements, for the purpose of working other mines: *Provided*, That any damages occasioned thereby shall be assessed and paid in the manner provided by the laws of the State or Territory in which such mine is situated for assessments and payments for land taken for public use under the right of eminent domain. And the rights and easements heretofore reserved under the provisions of this section (twenty-three hundred and thirty-eight of the Revised Statutes) in patents heretofore issued shall be regulated and made available as herein prescribed."

SEC. 7. That town-site entries may be made by incorporated towns and cities on the mineral lands of the United States, but no title shall be acquired by such towns or cities to any vein of gold, silver, cinnabar, copper, or lead, or to any valid mining claim or possession held under existing law. When mineral veins are possessed within the limits of an incorporated town or city, and such possession is recognized by local authority or by the laws of the United States, the title to town lots shall be subject to such recognized possession and the necessary use thereof, and when entry has been made or patent issued for such town sites to such incorporated town or city, the possessor of such mineral vein may enter and receive patent for such mineral vein and surface ground recognized by the local laws and statutes of the United States not held or possessed adversely to the claimant for such mineral vein by other than the said city or town, or when it shall appear that the claimant otherwise entitled to such mineral vein has acquired title to such surface ground from the said city or town: *Provided*, That no entry shall be made by such mineral-vein claimant for surface ground where the owner or occupier of the surface ground shall have had possession of the same before the inception of the title of the mineral-vein applicant."

Fresno Coal.

The Fresno *Expositor* thus describes the coal mines in the county: The mines are near Coalinga, on the Hanford branch of the Southern Pacific railroad, and in the foothills of the Coast Range in the western portion of the county. In a direct line they are about forty miles from the city of Fresno, by rail about eighty-nine miles. Up to the present only two companies have engaged in the work of mining the coal, namely, the San Joaquin Valley Coal Company and the California Coal Mining Company. The latter has only made a beginning, while the former's operations are on quite an extensive scale. The coal is a lignite or highly bituminous shale of the same general character as all coals hitherto found on the Pacific Coast. There are three varieties of coal in the vein, the upper and lower parts resembling cannel coal and the middle more like lignite. This coal approaches in analysis Coos Bay coal more than any other. There is enough coal in this county's coal region to last for centuries. The vein is four feet thick and the outcroppings can be traced for many miles north and south. The stratum is well defined and has been found perfectly regular so far, which makes it easier to work it and therefore cheaper. The layer has a slope of 27° and is mined overhead, a "lift" being 125 feet. The mines are worked by tunnels run into the sides of the hill, and are conducted by San Francisco and Fresno capitalists.

J. G. MENOAL, engineer in chief of the Nicaragua Canal Co., writes to a friend in this city that on Jan. 3d they had 15 feet of water at Greytown, and at the present rate of working would have 21 feet in 60 days. The dredger is at work and the mole being extended.

MESSRS. SCOTT, ECKART AND FIRTH have been appointed a committee of the Mechanics' Institute to acknowledge to A. S. Halliday the great benefits derived from his inventions of cable-car appliances.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CARRARA MARBLE CO.—Ledger, Jan. 24: A party of capitalists, accompanied by an expert in marble, paid a visit to the quarry located on Sutter creek, four or five miles below Volcano. They were very much pleased with the quarry, both as regards the extent and quality of the deposit. The company has not been fully organized yet. It is expected that everything will be arranged so as to commence active operations as soon as spring opens.

MISCELLANEOUS.—George Thomas has been working for some time on the White quartz mine, between Jackson and the Gate. A winze has been sunk alongside the ledge to the depth of 80 feet. Quartz of good quality is reported to have been taken out of the bottom. Ten stamps of the mill of the Amador gold mine were started on ore from the Hardenburgh mine at Middle Bar this week. It is the intention to make a thorough test of the quality of the ore, and the result will no doubt largely govern the future operations at this mine. The Kennedy is probably the best gold-producer of Amador county at the present time. The net yield last month is said to be in the neighborhood of \$20,000.

SUTTER CREEK.—Cor. Amador Ledger, Jan. 24: Once more the developments in the North Star have raised the hopes of the stockholders. Gouge has been encountered, which, in itself, is an excellent indication. Not only this, but within the last day or two a vein of quartz has been struck which is very rich, free gold being plainly visible. It is hoped that this will lead to a permanent ore body. It is confidently expected that the Mahoney will start up before long. Fifty tons of iron is on its way, for making several thousand feet of pipe to connect the mill with the Amador canal. Some of the iron has already arrived. It is rumored that the mill will be started as soon as the connection is made, perhaps for a time on surface rock. It is hoped that as soon as the mine can be opened the rock for the mill will come from the lower levels, and that the Mahoney will take its place as one of the permanent mines of the county.

PLYMOUTH.—W. T. Jones has bonded the Bay State mine from Hayward, Hobart and Poundstone. The location of the mine is north of Plymouth, and near Enterprise. It was known some years ago as the McGuire mine. There is a fine ledge of low-grade ore, that has paid on an average \$3.50 per ton with the commonest kind of an old-fashioned quartz mill, no sulphurets being saved; but with the latest improved machinery would go much higher, and the sulphurets are known to be very rich and easy to work. The mine is sunk at present less than 500 feet deep, and the ore is so abundant that it can be mined and milled at a cost of \$2 per ton. The New London mill is shut down, and there is no time stated when it will start up again. The mine is still working with enough men to keep the water out and prospected. The Pacific is running along with a small crew of men prospecting for a big thing. The Good Hope is getting out pay ore and sacking it up preparatory to moving to the mill.

Calaveras.

THE TUTTLE MINE.—Calaveras Chronicle, Jan. 24: Last Saturday we visited the Tuttle gravel mine in Chili gulch, about three miles from this place, where prospecting operations have been going on for the past six or eight months under the direction and superintendency of Geo. R. Tuttle, a gentleman of large mining experience. In striking contrast to most mining ventures, we found no big developments on top. There is a modest water-power hoist run by a six-foot Donnelly wheel, against which the water plays under a 200-foot pressure. A fine working shaft, framed with sawed timber and lined with two-inch plank, 200 feet in depth, 34½ feet in the clear, with a ladder-way 23½ feet, has been sunk. This shaft will drain thoroughly the northern portion of the channel. Drifts have been run east and west, the explorations in the former extending 250 feet without reaching the rim rock, and the latter over 40 feet, reaching what may prove to be the rim, but which, there is reason to believe, is only a little swell in the ledge to be followed by a depression, hence not yet showing the western boundary of the channel. Should it be revealed that the rise encountered is the western limit of the channel, the gravel deposit would then show a breadth of about 300 feet. The mine comprises about a quarter of a mile of new ground on the channel to the north line, with 3500 feet of untouched ground to the southern boundary. The drifts are in gravel from top to bottom, the depth of the deposit being known to be more than 12 feet in some places and prospecting well throughout and will run from \$2 to \$5 a carload. With this showing a mill is to be put up as soon as the material can be laid upon the ground, the grading for which has already been completed.

LEHIGH GRAVEL.—Calaveras Prospect, Jan. 24: Henry C. Richards, President of the Lehigh Gravel mine, and V. E. Frost, the Superintendent, have been in Murphy's the past week looking after the extensive interests of the company. The Echo mine, as it is generally called, has had many ups and downs. The Lehigh Gravel M. Co. leased the ground some time ago, and under the superintendence of Mr. Wilson, made extensive explorations, and did what no parties have done heretofore, succeeded in reaching the water, which is pretty good evidence that the old Table mountain channel has been struck. Mr. Frost has recently been appointed superintendent, and we learn that he intends to prosecute the work with vigor. This ought to be a good mine and we have the firmest faith that it will so prove eventually. About 1875 it was held in the London market at \$1,000,000, and we should not be surprised to see it bring that amount in the near future. Vernon Wilson and Dave McDonald are at work opening their mine opposite the tollgate at Murphy's. They are working four men at present, and have erected quite substantial hoisting works. This mine was worked several years ago on a small scale and paid well, but lack of money for the proper development caused its abandonment. The Lone Star mine at West Point paid off last week and is preparing to start in with renewed vigor to work that extensive property. The Blazing Star in the same district has started up again. Everything points to a lively season at the Point this spring

J. H. Sterling is doing some extensive prospecting about West Point. The Central Hill mine between Murphy's and Douglas Flat is rushing now under Mr. Buckminster's energetic management. The Norfolk at Murphy's is running both mill and mine, full handed.

SALTWARE.—Mountain Echo, Jan. 22: The Saltware mine, situated on Indian Creek, this county, has been bonded to a San Francisco company and it is said that a 20-stamp mill is soon to be erected.

THE DAUPHIN MINE.—Calaveras Chronicle, Jan. 24: The Dauphin mine, located above Jesus Maria, is likely to prove a good investment. The mine has been prospected off and on since 1851, and a nice little "pocket" was struck by Chilenos, who worked it in early days, from which they extracted the snug little sum of something like \$45,000 in a very short time; and at various periods since, good yields have been obtained. Recently, good rock has been encountered in the prosecution of prospecting operations, and in the event of a continuance of these very favorable developments a mill will be put up at once. Mr. William Caldwell of San Francisco is now the sole owner of this property, and he feels highly elated over the developments. The mill plant is secured and ready to be shipped as soon as a few weeks more prospecting will have been done and the results warrant the construction.

El Dorado.

A BIG PROPERTY.—Georgetown Gazette, Jan. 22: The lode is porphyritic-talc formation, known to extend for more than 4000 feet from the town to the north, on which sluicing has been done at various points at intervals since the '50's. The lode has an average width of 20 feet. A shaft was sunk on west side, and after extending crosscut 32 feet a granite-like foot-wall was cut when rich prospects were found, and the ore has continued to increase in gold up to the present face of the cut, which shows 19 feet of lode, and not yet cut through. The entire 19 feet will mill at least \$20 to the ton. It looks as if the last three feet penetrated would mill \$100 per ton. The lode is cut at a point 80 feet below the surface. A Huntington mill is reducing ore at the rate of 18 tons in 24 hours, and judging from the amount of amalgam that accumulates at the point of discharge (the mill retains most of the gold) a rich clean-up will be made. Not a particle of free gold or quick passes beyond the silver plates, and Mr. Hersey, the amalgamator, takes pride in inviting expert panners to detect the same. Supt. Tischer has seen many good-paying mines but this beats them all, as every evidence (the lode at this point being "uncovered" for a distance of 500 feet) shows permanency of rich milling ore. The management will soon decide upon a system of extensive works. The present is merely a prospecting outfit.

Inyo.

ANTIMONY.—Register, Jan. 22: In doing the assessment work on the antimony mine owned by Wm. Hannigan, at Wild Rose, an immense body of fine ore was recently uncovered. The Austin antimony miners are said to think a 60-pound chunk of rich metal pretty large. Mr. Hannigan says he has in sight regular holdwires of it of 200 or 300 pounds weight.

STRIKES.—Inyo Index, Jan. 24: Glowing reports of rich strikes in the White Hill district of the Inyo mountains are coming in. There is enough silver-lead in that section to enrich thousands.

Nevada.

THE BRUNSWICK MINE.—Transcript, Jan. 24: Assessment No. 1 of two cents a share has been levied by the Brunswick M. Co. of New York, whose quartz claim is located at Grass Valley. A circular just issued by the vice-president explains the necessity for the assessment. The development thus far has been so satisfactory that an assessment was deemed wise to provide funds for pushing the work further so that sufficient accumulation of ore could be obtained to keep the mill running after it has been started.

A GOOD MOVE.—Nevada Co. Herald, Jan. 24: Efforts are being made to induce the South Yuba Canal Co. to bring water down the Washington ridge. The representatives of the company will examine the route and soon decide whether the work will be done or not. Should the water be brought down that way it would encourage the opening of mines all along the line from the Sugar Loaf to the Central House. It would afford facilities, also, for irrigating and would probably result in the development of a great deal of agricultural land.

RICH QUARTZ.—Grass Valley Union, Jan. 27: Several very rich specimens of quartz were exhibited at Weissstein Bros.' bank yesterday, that came from the Irish-American claim on New York Hill. The gold was heavy and showed in hard quartz, which also made a good showing of galena. The quartz was taken out by tributaries, who are now working the ground. The Irish-American lies due north of the North Star mine (the Fahey claim intervening) and adjoins the New Rocky Bar mine on the west. It is on the rich quartz belt on the west side of Wolf creek, which has produced millions of dollars.

STRUCK A BIG LEDGE.—Nevada Transcript, Jan. 20: Leonard & Son have found a four-foot ledge of gold-bearing ore on the hill half a mile above Jones Bar on the South Yuba river. Several years ago a quantity of wonderfully rich float quartz was picked up in that vicinity, pieces of it being worth at the rate of \$20,000 a ton, and various parties have since been engaged at intervals in hunting for the ledge the float came from. The Leonards think they now have it. The course of the ledge appears to be such that it crosses the river and through the territory near the head of the G. V. R. and T. Co. tunnel.

Placer.

ROCK CREEK.—Placer Herald, Jan. 24: Pike Bell is running his mill night and day at present, crushing rock taken from his mine on the Beecher place on Bald hill. W. S. Graham, M. T. Lawrence and Bell will soon commence building a reservoir on the Green Emigrant hill. The reservoir is meant to hold water for sluicing the rich surface dirt from the hill, and these gentlemen expect big returns for their outlay.

Santa Cruz.

PETROLEUM MINES.—Santa Cruz Sentinel, Jan. 24: The mining at the petroleum mines in the hills nine miles north of this city and three miles from the sea, is abating in its product. These mines are three in number, the Walrath, Cowell and Consolidated Bitumen. They are near together, but some distance apart via the roundabout roads by which

they are connected. It is estimated that their present output is from 80 to 100 tons per day, and that 15 men in the mines and 30 men and 30 teams on the road are employed, at an expense of \$70,000 per annum. A *Sentinel* representative visited the mines and found mean roads to start with and roads in a mean condition, muddy, narrow, rough and steep. In some places the bitumen is on the surface of the ground, in other places under the ground, in others under rock, in others on top of the rock; thin, thick, and in some instances oozing out in a liquid form. The face indications of the mines named lead to the conclusion that the bitumen deposits of this county are inexhaustible, and that so long as they can be worked successfully they will be a source of great revenue to this city and its immediate vicinage. As these mines must be worked in competition with San Luis Obispo and other deposits, owned by men of push and twenty-dollar pieces, we must have shorter roads, roads of lighter grades, roads of solid bottoms in wet weather, and cheaper shipping facilities generally. This is a business proposition, brought to our doors by sharp competition.

San Diego.

OWENS.—Julian Sentinel, Jan. 23: The new boiler for the Owens mines is being put in place this week. The work of bailing out the mine is progressing favorably, and it is thought in another week the pump will be reached, when all will be smooth sailing.

STRIKE.—A rich strike has been made in a Banner mine the past week. We are not at liberty to give names or particulars at present, but it is an important find and we will be glad to give further notice as soon as we receive permission from interested parties.

Shaeta.

THE EUREKA TELLURIUM MINE.—Democrat, Jan. 23: In company with Peter Scherer, treasurer of the Eureka Tellurium M. Co. and superintendent of the company's mine on Salt creek, we went out to see this mine yesterday forenoon. We found development work under full headway. The company is now driving a large working tunnel with a Phoenix drill. The working plant consists of a fine air-compressor engine of 30-horse power, which drives the drill and ventilates the tunnel. The power plant is located at the mouth of the tunnel, and the boiler and engine are set on a concrete foundation; the floor of the engine-room is all concrete. Everything about the plant is neat, bright and clean. Going into the tunnel, we saw the drill work. Monday, one shaft put in seven four-foot holes and the blasts used up 15 pounds of powder. From this, miners will understand that the company is making rapid headway with the tunnel. The rock through which the tunnel is driven is exceedingly hard serpentine, consequently no timbers are required. The tunnel is now in 280 feet, and according to the survey, in 370 feet more the ore body will be encountered quite a depth under the development shaft on the hill. Recent developments in the shaft and everything about this mining enterprise give assurance that the tunnel will open a very rich mine.

SILVER AND GOLD.—Floyd Vickers returned from Igo last Monday and brought with him samples of antimonial silver and gold ore recently encountered in the old Dayton mine. In doing the assessment work, driving ahead on the prospect tunnel, this new body of ore was struck. The vein is about three feet wide and the ore will assay an average of about \$350 a ton. The owners are greatly elated over this strike and feel confident they will speedily develop a big mine, and calculate soon to commence shipping ore to a smelter.

COAL.—Newt. Welsh of Millville was in town yesterday, and informed us that a couple of Pennsylvania coal-miners, backed by a San Francisco capitalist, are prospecting a coal vein on Coal gulch, about 12 miles east of Millville. They have sunk a shaft about 80 feet on the ground. They say the shaft has passed through a vein of very good steam coal, and are well satisfied with the prospects of opening a good coal mine. Mr. Reed, mining engineer and superintendent of development work on the Central mine in Old Diggins district, is running a new and lower tunnel on that mine. The tunnel is now about 80 feet.

NEW QUARTZ MILL.—Democrat, Jan. 23: In company with Fred Grotefeld, we went out to Old Diggins mining camp last Sunday to see the new ten-stamp quartz mill that is almost completed by Mr. Hart, owner of the Texas and Georgia mine. The mill is erected on the river bank about a mile north of the Walker Bros.' mill. Its present capacity is ten stamps, so arranged that ten additional stamps can be put in at any time, and this Mr. Hart intends to do some time next summer. The machinery is run by a 65-horse power engine planted on the east side of the building, and the water is pumped from the river to a tank holding 7500 gallons, situated on the hill above the mill. Sitting in line with the battery are four improved Frue concentrators. Above the stamps is an ore bin that will hold 400 tons of ore, and above the bin is stationed a large Dodge rock-crusher, which is run by a small engine, but fed with steam from the main boiler. But to us the most interesting feature about this mining enterprise is the huckle cable ore tramway that was just being finished while we were there. The tramway is calculated to deliver five tons of ore an hour. It is a little less than a mile in length, or nearly two miles of cable. The station at the mine is about 625 feet higher in altitude than at the mill. The engine at the mill runs the whole plant. This is the first cable tramway ever erected in this part of the State, and taking it altogether is the most complete and modern milling plant in this part of the State. The tramway was finished last Sunday, and in a very few days the mill will be finished and the whole plant running.

Siskiyou.

BLUE GRAVEL.—Yreka Journal, Jan. 21: Geo. W. Henderson, a mining expert from below, was in this county last week and made a thorough examination of the blue gravel mines at Cottonwood creek, also on Greenhorn creek and around Yreka, and considers them rich, paying mines, such as cannot fail to create a big mining boom for Siskiyou in the near future. He firmly believes the blue gravel deposit, so extensively found in all our mining districts, is much deeper in some of them than in others. Lee, Lash & Co. are still cutting a tunnel into their blue gravel claim at Greenhorn, and find the bedrock pitching under a hill, requiring deeper drainage in order to take out the rich pay gravel, which seems to

be in the bed of an ancient river or lake. As soon as good drainage can be secured to the pump shaft, to permit working, they intend putting on a large force of men, and expect to realize an extensive haul of gold-dust, as all the blue gravel so far tested has paid exceedingly rich.

HORN BROOK.—Clear frosty weather for the past week, but not very cold, just ice enough to prevent miners turning water in the ditches. Jilison & Co. had five days and nights piping and had to clean up in order to extend the race and flume. They were not half through cleaning up when they were compelled to turn the water out of the ditch. Just the same they realized \$350 from the five days work, picking up \$100 in coarse pieces on the bedrock. This is undoubtedly one of the best mines in the county, and next summer's cleanup will make advocates to blue gravel and cause still more capital to be invested in this end of the county. The Black Jack continues to prospect well, the best prospect ever found in the mine being found a few days ago in their main tunnel. The mine will probably be worked on an extensive scale the coming summer. Gilham and Paine have a contract to sink a shaft on the Portland Co.'s property, and are down 25 feet. Conant and Fowler, who have a bond on the Amous & Co. quartz property, are driving the main tunnel, and the property, from present indications, is a good one, the ledge being three feet, with \$15 to \$20 in free gold and plenty of rich galena sulphurets.

Sierra.

GOLD DUST.—Mountain Messenger, Jan. 24: Hayes & Steelman cleaned up their flumes at Gold Lake last week and as a result carried \$35,000 worth of gold dust to San Francisco. A section of the Thistle shaft at Gibsonville had to be retimbered, owing to a movement of the ground twisting it out of shape.

Trinity.

MILLS RUNNING.—Journal, Jan. 24: We are informed that the two quartz mills on Canyon creek are now running on full time. The last rain-storm was a warm one and it increased the water supply to quite an extent. We expect good reports from the crushings done there.

Tuolumne.

AGAIN RUNNING.—Tuolumne Independent, Jan. 24: The Sonora Con., J. H. Neale, superintendent, reports that the mill is again running after being frozen up a week, owing to ice in the ditch. They have been getting out good rock all the time.

THE DEAD HORSE mine at Summersville is running again after being frozen up a week, the ice being so thick the mill could not run. A dozen or more men were engaged in cutting ice out of the ditch to get the water running.

NEVADA.

Wahoe District.

ALTA.—Virginia Enterprise, Jan. 24: The watchman reports that at 12 o'clock every night he thinks he can hear the sound of pick, drill and blast in the mine.

GOULD & CURRY.—200 level; Upraise No. 1, 70 feet from No. 2 crosscut, has been carried up 9 feet through old quartz showing some value; total height, 25 feet. 250 level: Work was resumed in west crosscut No. 1 and same was extended 15 feet through old filling of fair quality; total length, 45 feet. 300 level: At a point in the southwest drift, 225 feet from west crosscut No. 1, started and extended west crosscut No. 2 a distance of 30 feet; total length, 52 feet; formation porphyry with streaks of clay.

BEST & BELCHER.—800-foot level: West crosscut No. 1 has been extended 14 feet, passing through hard quartz showing some value; total length 432 feet. 1200 level: West crosscut No. 1 has been extended 16 feet through hard porphyry with small seams of clay; total length, 20 feet.

YELLOW JACKET.—Crosscutting on the 68th level and doing the usual work of exploration. Shipping 40 tons of ore daily to the Brunswick mill, the average battery assay value of which is \$18 per ton.

JUSTICE.—The north drift, 822 level, is out 227 feet. The face is in hard porphyry. We have commenced stoping fair-grade ore from the bottom of the 400 south winze. The stopes are yielding the usual amount of milling ore. Shipped to the mill the past week 191 tons and 485 pounds of ore. Average battery assay \$23.81 per ton.

CON. IMPERIAL.—Work is still being confined to following up and taking out small streaks of ore on the upper levels and overhauling the old stopes of the mine.

CONFIDENCE-CHALLENGE.—The joint Confidence and Challenge raise from the 750 level is up 139 feet, 9 feet having been added; the top is in quartz of no value. The joint Confidence and Challenge west crosscut from main north drift on the 1100 level is in 93 feet, 25 feet having been added, the face showing quartz of no value.

SEG. BELCHER.—The 600 level, south drift, has been extended 30 feet during the week, and is now out 100 feet; the face is in soft porphyry.

BELCHER.—Started a crosscut west from the south drift from No. 3 crosscut, 200 level, and it is now out 32 feet. It has passed through material composed of clay and porphyry, and which is still in the face. Started a west crosscut from the south drift in the west ledge, 300 level, which is out 60 feet and has passed through material composed of quartz and porphyry. The 1400 raise has been extended 13 feet during the week, and is now up 50 feet on the slope. The top is in low-grade quartz.

CROWN POINT.—The northwest crosscut on the 500 level was extended 23 feet during the week, and is now out 128 feet. The face is in soft porphyry. We are saving from six to eight cars of ore per day from the 1300 level.

OVERMAN.—Extracted 495 tons and 1200 pounds of ore. Car samples average \$15.17 per ton. Shipped to the Brunswick mill 493 tons 1260 pounds of ore.

KENTUCK.—The west crosscut from the north lateral drift, 950 level, was extended 15 feet during the week through streaks of quartz and porphyry, and has reached the footwall. Started an east crosscut opposite it Jan. 20th. Have started a north drift on the 1000 level in the east drift, which is out 10 feet; face is in low-grade quartz. Have started a raise from the east crosscut opposite the north drift opposite the 950 level. On this level have put in a switch and set of timbers in west ledge, preparatory to running north from the main east crosscut.

SAVAGE.—Milled 520 tons of ore, the average battery assay of which was \$15.75 per ton. Bullion

on hand, \$14,106. The winze below the 1300 level is down 65 feet; the bottom is in pay ore. Doing the usual amount of repairing work and bulkheading on the different levels.

TALE & NORCROSS.—On the 1400 level the north and south drifts from the station are now opened and extended 90 and 50 feet respectively. East crosscut No. 1 opposite the incline was advanced 25 feet; total length 50 feet; face in porphyry. In the north drift, 60 feet from station, started east crosscut No. 2 and west crosscut No. 1. These crosscuts were started opposite each other, and are each advanced 10 feet in quartz and porphyry.

CHILLAK.—Extracted and sent in the mill the last week 532 tons of ore, the battery assay of which, as per battery samples, was \$19.87 a ton.

EXCEQUEK.—East crosscut, 150 feet south of north line, 500 level, is out 410 feet; face in soft porphyry and clay. East crosscut near the south line, 600 level, is out 260 feet; face in clay and porphyry. East crosscut on the north line, 600 level, is out 36 feet; face in hard porphyry and quartz.

ALPIA.—The south drift from east crosscut from shaft, 600 level, is out 12 feet; face in quartz giving fair assays.

SILVER HILL.—Northeast drift, 160 level, is out from the winze 585 feet; face in porphyry. Northwest drift, 334 level, is out 820 feet; face in hard porphyry.

WARD COMBINATION.—East drift from shaft, 1800 level, is out 790 feet; face in porphyry.

OCCIDENTAL.—The upraise started last year 100 feet south of No. 3, on the 550 level, and carried up to the 500 and 450, has now reached a point where, in a few days, it will connect with the 400 level. This new upraise will greatly facilitate the working of that portion of the mine. The south drift from the bottom of 5 winze, on 650 level, is in 93 feet; face showing low-grade quartz.

UTAH.—On the 725 level the northwest lateral drift from the main west drift from the shaft has been extended 37 feet; total length 316 feet in a porphyry and clay formation. The west crosscut from this north lateral drift has been extended 19 feet; total length 25 feet. The face of the crosscut shows a mixture of porphyry and quartz of very low assay value.

ANOS.—During the past week north drift, 420 level, was advanced 15 feet through a formation of porphyry, quartz and clay. East crosscut from south lateral drift is advanced 15 feet through a vein formation.

Hawthorne District.

MINING RECORDER.—Walker Lake Bulletin, Jan. 21: An election for Mining Recorder of Hawthorne district was held at the Pamlico boarding-house last Saturday. W. S. Cooke of the Central mine was elected to serve for the ensuing year.

Pioche District.

SMELTER.—Pioche Record, Jan. 22: The furnace at the smelter has been given a thorough overhauling and everything points to a long run.

YUBA.—The night shift at the Yuba mine has been dispensed with and the full force is employed in the day-time only, causing a considerable saving to the company.

BULLIONVILLE.—There is a rumor around town that the Bullionville mine is likely to change hands, San Francisco parties having bonded a part of it and are figuring for the balance.

DAY ORE.—The Pioche Con. M. Co. recently shipped 150 tons of Day ore to Salt Lake City for reduction. This was done under orders from headquarters to see what market value the ore had, if any. The shipment was divided into three lots and sent to as many different smelters. Two of the smelters allowed for the lime contained, in addition to the silver and returned a profit. This ore was blown out and shipped without sorting, and the result indicates what we may look for when the railroad shall be completed, as 400,000 tons of similar stuff are estimated to be exposed now. The Day ore is worth in the market for fluxing, double the value of the silver contained in it, and it is this feature which makes the property so valuable, no mine similar to it being known of within 500 miles of us.

San Antonio District.

ASSESSMENT WORK.—Belmont Courier, Jan. 17: Peter Rice and his son William have finished the assessment work on some of the mines in San Antonio district.

Tuscarora District.

NAVAJO.—Tuscarora Times-Review, Jan. 23: Stopes below the 350-foot level are not showing as much first-grade ore as at last report.

DEL MONTE.—North drift, 1st level, advanced 12 feet, cutting seams of ore assaying from \$8 to \$10 per ton.

COMMONWEALTH.—First level: South drift from west crosscut advanced 18 feet on seam of ore. Joint raise up 34 feet, progress 17 feet, through low-grade vein matter to hanging-wall. Fourth level: East crosscut extended 33 feet; rock continues hard.

BELLE ISLE.—The stopes on the 350-foot level continue to produce a high grade of ore. Nine cars of very high-grade ore have been broken during the week; and 42 cars of a good grade of concentrating ore were hoisted. Joint east crosscut, 450-foot level, extended 13 feet, passing through the first parallel vein, which gives some fair assays in spots. South drift from west crosscut, same level, extended 20 feet without material change.

NORTH COMMONWEALTH.—First level: Joint raise reached hanging-wall at 34 feet, progress 17 feet, vein matter cut low grade. Resumed work in north drift on footwall, now in 10 feet from joint raise. Fourth level: North drift advanced 26 feet without change. South drift from west crosscut, second level, on vein 20 feet, ore occurring in bunches; assay from same \$34 per ton. Hoisted 19 cars of ore, assay \$331 per ton; 67 cars of ore, assay \$29 per ton.

NORTH BELLE ISLE.—A crosscut has been started east from the 400 north gangway opposite the crosscut to the vertical winze, progress five feet, cutting through 18 inches of good concentrating ore and showing seams of good ore in the face. The 500 stopes are not looking as well as at last report. Sixty-nine cars baby ore were broken. The upraise from the south end, 300 level, extended five feet and connected with the stopes. The concentrator crushed 300 tons, estimated assay value \$15.08, giving 26.26 tons of wet concentrates, estimated assay value \$143.45.

Tybo District.

LOOKING WELL.—Belmont Courier, Jan. 17: Henry Metz informs us that the 2-G mine at Tybo

is looking splendid. An important strike was made in this mine recently, and the discoverers say that the ore is of a good quality. This mine has been retimbered, and it is now in fine condition for working. Undoubtedly the work of extracting ore will soon be resumed. Mr. Metz firmly believes that Tybo will be a good mining camp in the near future.

ARIZONA.

CERBAT.—Mohave Miner, Jan. 24: John Barry is taking out a good deal of gold ore from the Cerbat mine which will shortly run through his mill. McLeish and Henson are taking out some unusually rich ore on their new discovery two miles east of Mineral Park. Their claim is near the old Baden-Baden, and said by those who have seen it to be very rich. Superintendent C. P. Park has let a contract to Mr. Mitchell to sink 100 feet on the Queen Bec, making a total depth of 170 feet when completed. Mr. Mitchell is working three shifts and making about two feet a day. The Empire is looking way up, in fact this property shows better for every day's work put into it. Superintendent Thompson now has a force of 16 men at work. The main shaft has reached a depth of 150 feet, and is in good ore. The mine will ship between four and five carloads of ore next week. Superintendent Benjamin, of Denver, has a large force of men at work on the Elkhart, and expects the daily output to be from 20 to 25 tons of high-grade lead ore as soon as he can put the mine in shape. The Rip Van Winkle tunnel has cut the ledge, and in the drift, started at the intersection, a fine body of high-grade ore has been encountered. Work on this tunnel has been vigorously prosecuted for the past year, and now Messrs. Jamison and Sample are to be rewarded for their faith and energy. The new tunnel taps the ledge about 200 feet below the old works and thoroughly drains it of water. Connection will be made with the old works as soon as possible and then stoping will be commenced in earnest. C. E. Sherman has sold the Distaff mine at Chloride to the Denver M. & M. Co., formerly the Denver Syndicate. The new owners have gone to work on the property with a will, and a contract to run the lower tunnel in 300 feet farther will be let in a few days. A hoist capable of sinking 100 feet, now on the road, will be erected shortly and the main shaft sunk 400 or 500 feet deeper.

COLORADO.

THE SILVER CREST.—Aspen Times, Jan. 24: The property is being worked by a shaft. This was not started until a short time ago. It is being sunk in a sort of basin and at 40 feet some ore was found, but the main vein is much deeper and the shaft will be continued down.

THE SAOOLE ROCK.—Manager Murphy of the Saddle Rock has let a contract to sink the shaft on that property 150 feet deeper and work will begin to-day. The present depth is 450 feet. From this level considerable ore was shipped, so there is almost a certainty of finding mineral at a point 600 feet down. The drift from the 450-foot station is also being run under contract. It is now 115 feet into the face. Yesterday the rock showed bunches of ore as if the vein was not far ahead. It is expected to strike the ore body from which shipments were made in the 90-foot winze.

THE ST. JOE.—The work on the St. Joe incline is going forward without interruption. Since Manager Murphy took hold, it has been sunk about 40 feet and is now down nearly 100 feet. It is in good ground and looks as if it might be in the vicinity of ore. However, the lessees are not expecting mineral so soon and have made their arrangements to go down 400 feet.

LOWER CALIFORNIA.

ALAMO.—Lower Californian, Jan. 24: Although the Princess mine has closed down temporarily, the actual work going on in Alamo is greater than ever before. The Princess mine developed very hard strata or dykes which cut the ore body into small spurs, and while nobody doubts that the ore collects into one large vein below the obstruction, it is clear that drilling and working by hand is too expensive. The mine was therefore closed down pending the developments on the Indio, where the fine new air compressor and steam drill will soon be at work. A Burleigh will no doubt be put into the Princess later on. The Aurora, joining the Princess on the East, is almost ready to resume sinking, the big boiler and hoist being in place. Russell & Rhodes have given orders to sink to a certain depth regardless of other developments so as to find out what there really is. Much interest is manifested in their operations, as theirs will soon be the deepest mine in the most important lode in camp. The Indio and Ulises are working day and night, and many chloids are working besides on various small sections of both. Some of these contractors are getting out rock running from \$100 to \$190 per ton. The shaft on the Scorpion is being steadily sunk, and the vein still holds good in width, and the rock seems to get richer. It will easily run \$100 per ton. The Scorpion mill is being put into excellent shape by Captain Selby, who has been engaged as superintendent by Mr. Mitchell. It will soon be ready to run. Frank D. Mason is doing good work on the Rainbow. The tunnel is in 200 feet, with a winze of 30 feet, and drifting has begun from thence into the hill. The mine is perfectly dry and Mr. Mason will shortly make another run of ore. J. O. Sheldon is still at work on the Rattlesnake, and getting out good rock. The Placer mine near by, is too full of water for profitable working. Farther down the gulch, N. Van Tassel is working two adarans on rock from his mine, and the rock runs as high as \$100, averaging about \$30. Plenty of water is running in the creek and it seems as if a mill would pay.

IDAHO.

QUEEN OF THE WEST.—Elmore Bulletin, Jan. 24: Pearson, Alexson and Adams are now stoping in their Queen of the West mine, and daily extracting large quantities of very rich ore, which is stored in bins till shipped. The ledge where stoping is being done is seven feet in width. These gentlemen will endeavor to build a small mill at the mine during the coming summer.

ELMORE.—Thursday, a drift was started at the 550-foot level of the Elmore shaft for what is known as the Elmore big ledge. This drift will cut the old

stand-by about 200 feet below the level of the old works, and it is estimated the big ledge will be tapped within 60 days.

WARRENS.—Weiser Signal, Jan. 23: This remarkable little camp is situated in Idaho county, a short distance over the Washington county line, and very isolated, everything being taken in by pack-train, causing all kinds of commodities to be held at very high prices. There are about 100 white men in the camp, and about 2000 Chinamen, who are working on the old placer mines. A good many more whites will arrive there next season. About 60 quartz claims have been located.

THE MAYFLOWER is owned by King, Johnson, Church and Gaskell, who have a five-stamp mill on their claim. The mill has been run steadily this season until the coming of winter closed operations; the ore worked more than paying for all improvements on the mine. A shaft 90 feet in depth is tapped by a 200-foot tunnel which runs for the whole distance through ore.

THE LITTLE GIANT is owned by George Riebold and has so far proved to be the best paying mine in the camp, it having been more thoroughly developed than any and the ore being very rich, running from \$100 to \$5000 a ton. A run of 13 tons of ore returned \$23,000. There is a five-stamp mill on the mine and about 200 tons of ore were worked in it this season.

THE KNOTT is owned by Gov. Norman B. Wiley. Three tunnels have been run on the ledge, the lower one being 90 feet below the upper one and has been run in the vein for 400 feet. The mill on Steamboat creek was moved to the mouth of the lower tunnel this season, and another 100-foot tunnel has been contracted for. The ore runs from \$25 to \$30 a ton.

THE KEYSTONE is owned by H. F. Randall. Twenty tons of ore worked last season in an arastra turned out \$80 a ton.

THE WASHINGTON worked 100 tons of \$40 ore in Wiley's mill before it was moved from Steamboat creek. The owners, Ockart, Warnham & Thompson, have been stoping ore all summer.

MONTANA.

AN OLD DISTRICT HEARD FROM.—Montana Mining Review, Jan. 20: The recent report of a strike in the West Point mine, located in Wallace district, about 20 miles east of Missoula, has been confirmed, and work is being rapidly pushed on the property. A shaft is being sunk on the vein, which, at 187 feet from the surface, is said to be entirely in ore, consisting of black copper, gold, silver and lead, valued at \$38 a ton, the ore body improving in size and richness as work progresses, the vein showing 19 inches of black copper ore. It is understood that there are about 400 tons of ore on the dump that will average fully \$25 a ton. The district in which this valuable property is located was discovered about 13 years ago, but its development has been retarded owing to a lack of capital and faith in the country, the value of which as a mineral region is only now being demonstrated.

BUTTE.—Inter-Mountain, Jan. 24: There has been little or no change during the past week in the material prosperity of the camp. The Anaconda mine is working at its full capacity, as is also its sister, the St. Lawrence, that joins the former on the east. Both mines are worked at every point and the whole of both properties is in a most prosperous condition. Since the resumption of these two big mines the Chambers syndicate of mines have not been as active, as will be seen from the number of men employed. The mines of the syndicate are being held in reserve for any emergency and for the future enlargement of the company's already mammoth works. Some of the larger mines, chiefly the Mountain View, have laid a portion of their forces off during the past week, owing to the inability of the smelting plant to dispose of its ores. The ore in this mine is beyond calculation, and is sufficient to keep the whole of the smelters in active operation for years. The Gagnon is employing more men in its depths than ever before in the history of this property and the immense engine is performing its work to the full satisfaction of all concerned. Of the Nettie, the same may be said. This is one of the prominent mines of the Colorado Mining & Smelting Company. Ore sufficient is being taken from these properties to keep the large smelter in full and active operation.

FLINT CREEK DISTRICT.—Phillipsburg Mail, Jan. 24: There seems to be no further doubt that the Flint Creek mining district in general, and Phillipsburg in particular, will experience a mining, business and building boom the coming spring and summer. Probably in no other mining district in the State is there as much activity among the poorer class of prospectors as there is at present in the Flint Creek district, nor is this activity confined alone to the poor prospectors, but outside as well as local capital is being freely and intelligently invested. Within the past month or so, two large and well-backed mining companies have been organized, and are now engaged in the development of their ground with the full confidence, respect and good wishes of not only the purchasers of stock but of every other person in the community.

EAST GRANITE.—The East Granite Co. is not only enjoying an enviable local reputation, but its fame seems to have extended far and wide. In the east drift of the 70-foot crosscut, ore has been found, and considerable of it too, that assays more than 100 ounces. The lead on this level is almost, if not quite, four feet in width, and improving as greater depth is attained.

THE BI-METALLIC.—This company has been doing a great deal of prospecting, and in the past year has started two new shafts—one on the Zeus, about 3000 or 4000 feet west of the main working shaft on the Blaine lode, and another on the Fanny Farnell, which lies between the Zeus and the Blaine. The Farnell shaft has three compartments, and very heavy machinery is being placed in position, which would indicate that the company intends to use it for another working shaft.

NEW MEXICO.

NO IDLE MINERS.—Silver City Enterprise, Jan. 24: There are no idle miners in Pinos Altos. Some very rich ore has recently been encountered in the Mammoth. E. J. Fender is working his prospect just east of the Giant and is taking out some excellent ore. There are now some 60 or 70 tons of high-grade ore on the dumps of the Osborn group awaiting treatment. J. W. Clark, lessee of the

Golden Giant, is taking out splendid ore and in sufficient quantity to pay a dividend on a capitalization of \$50,000. He is now working in the north drift of the first level, 160 feet from the surface. The Pacific mill, which was shut down for nearly two weeks on account of bad roads, is again running on regular time. The mine is producing its regular output of from 30 to 40 tons per day. The Key has been increasing its force of late. The 600-foot level is showing better than ever before. The south drift has been started at that depth and it is estimated that within 100 feet the free gold streak which was so rich on the 500-foot level will be struck. An exposure of 150 feet on the Auston & Thomas property shows a body of ore estimated at from 38 to 40 feet thick. The ore averages from 15 to 20 per cent lead and about \$20 in silver. It is probably the largest showing of ore for the work done in the West.

UTAH.

SMELTER.—Salt Lake Tribune, Jan. 23: A Tribune reporter was shown some letters yesterday regarding some mining transactions in which the writer said he was in correspondence with some men regarding the investment of a half-million dollars or more in a smelting and refining plant. They are investigating the question of placing such a plant in this valley, and the correspondence passing between the writer of the above letter and the Eastern gentlemen will, no doubt, result in bringing them to look over the field. The working charges and extra freights which the mines have to pay on ores sent East for reduction keep the margins so low as to leave but little above working expenses. Large reduction and refining works here will aid some of these properties to become prosperous and profitable mining enterprises.

SMELTERS WILL ENLARGE.—It is understood that the smelters below the city will enlarge their plants to some extent this year. The Mingo has been extending its capacity very much the past two or three years, and is not yet through. The Hanauer has also made additions and the Germania has been undergoing great changes, which increase its capacity.

CAMP CROSSCUTS.—Park Record, Jan. 24: The Glencoe now has four feet of good ore. It runs 42 ounces in silver and 30 odd per cent lead. Thursday was pay-day at the Ontario and Daly mines and mills and at the tunnel. It was a late pay-day, hence eagerly looked for. There is a fine deposit of alum over on the Provo river that is attracting considerable attention just now. It was recently located by a couple of Park City gentlemen. The Crescent concentrator was closed down Wednesday of this week, having finished all custom work on hand. It will do no more work this season other than to sample Crescent first-class ore, which is now coming down from the mine. Geo. Burton, manager of the Lucky Bill, was down from the mine this week, and from him we learn that the shaft on that property is down about 75 feet. Two shifts are being worked and everything is moving smoothly. The vein in the New York group is looking better as it is drifted on. It is composed of manganese and quartz and is very encouraging in looks and general character. The walls are very regular and give great strength to the numerous indications of ore. The owners of the Eagle's Nest are still prosecuting work on their group below town with increasing faith. They claim their property has been slandered and that the near future will prove their faith well founded. The Anchor management has decided to rebuild the hoisting works destroyed by fire, and the contract for the same has been let to Mr. E. A. Shear. The sampling works are practically closed down, as none of the mines are hauling but the Anchor, and will not until it snows. The fact of the matter is the weather is too awfully nice for the business of this camp to be very lively. The sampler employees were laid off on the 18th.

WASHINGTON.

LEDGE MATTER.—Okanogon Outlook, Jan. 23: Tunnel No. 3 in the First Thought mine, commonly called the Tonkins tunnel, is now in 330 feet, and being driven at the rate of three feet a day. The contract was for 675 feet of a tunnel. Thus it will be seen that nearly half of the work is completed, while only a little over one-third of the stipulated time has expired. John Wentworth is doing some development work on the Independent mine in John Arthur gulch. A tunnel has been run in to tap the main ledge, which, after opening up several small stringers of from two to eight inches in thickness at different points in its progress, crosscut the ledge 110 feet in and at a depth of 100 feet.

SILVER CREEK.—Sultan City Journal, Jan. 24: The Sultan City pack train will leave on Monday for Booth's Camp at the lake. The trail is in very fair condition with the exception of the portion between Gunn's and Scott's. Work is still progressing at the Silver Queen and Vandalia camos, and the boys are enjoying nice weather. The heavy rains and warm weather of the past week have reduced the snow considerably in the mountains. If the weather continues as it is, very little snow will remain at the mines in another month. It is expected that the spring work this year will open about the middle of April. Last year it was the last of June before anything could be done at Silver Creek.

A BILL has been introduced in the Legislature by Hawley of Santa Barbara requiring that all artesian wells in this State shall immediately, upon their completion, be capped or furnished with such mechanical appliances as will readily and effectively arrest and prevent the flow of water from such well.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. P.) week to week and year to year.

MECHANICAL PROGRESS

Cold Saws in Shipbuilding.

A machine of recent introduction is what is called a "cold saw." This is simply a species of circular saw of fine steel, tempered somewhat hard, and about $\frac{1}{2}$ inch in thickness at the periphery; it is ground slightly thinner at its center to clear itself easily in a deep cut. It is made to revolve at a slow speed while it cuts through bars or plates of any section. This machine is almost indispensable where neat and accurate fitting is demanded.

There is not nearly much neatness in the framework of a ship, and therefore shipbuilders have not yet so largely availed themselves of the help offered by this tool as some other workers in iron and steel, such as bridge-builders. A few shipbuilders have found how it might be usefully employed, and doubtless it will, ere long, come into general service in all shipyards. It may be said that angle and other sections can be cut more rapidly by the shearing machine, or by a hot saw (so-called because it can only cut metal that has been heated to redness). True enough, but such bars cannot be cut with that accuracy to line and smoothness of finish which the cold saw gives. When a bar of angle iron has to be cut askew, for instance, usually it is first roughly cut off by the shears, and then it must be heated in a smith's fire, and, while hot, cut to the exact bevel required by warm chisels, and dressed by hammering, or by means of a "hot" saw it may be cut pretty accurately to line while hot. But in both cases a rough end is formed, and the expense of heating and dressing, or sawing hot, must be considerably greater than if it had been done at once by the cold saw.

For rough work that requires nothing better than the unfinished ends left by shearing, the saw is not necessary, and cannot thus compare with shears for economy. It is slow in its action, for it advances with its cut at the rate of about one inch per minute; but it is quick and economical compared with heating in a smith's fire and the delay of cutting and trimming by hand tools. And there are certain sections, such as Z and channel sections, which shears are hardly ever formed to cut. These, as well as round and square bars of large section, can be cut beautifully by the cold saw. The bar has simply to be placed on the table, so that its line of severance lies truly in the path of the saw. It is easily held fast by bolts in the slots on surface of table, and then the saw advances through the work. This machine differs from an ordinary circular saw in this respect, that it is not the work that moves up to the saw, but the saw is made to travel along the table through the work. It is driven by a worm-wheel and screw of some four or five feet in length, along which it can be moved easily by hand-screw gear or by self-acting feed gear. This feed gear can be quickly and simply detached when it is desired to run back the saw quickly by hand.

These machines are made by various tool-makers, without much difference in form. The large screw ought to be of steel and very smoothly chased, and the worm-wheel of some specially hard bronze composition. Bandsaws have also been used for cutting metals cold, but these are expensive, and can scarcely yet be said to be shipyard tools. Their place is more strictly in the engineering department.—*Engineering.*

ROLLING BOLTS AND THREADS.—At the Simmonds Rolling Machine Works, Fitchburg, Mass., there is a process in operation for forging articles by rolling. The rolling work is nearly all done between flat bars working vertically, and having the form cut into or raised upon the face. Quite a large business is done in making track bolts by the process, the head and threads being rolled hot. They have worked out the process of rolling threads with great nicety, and continue to make as clean and accurate, and of course much stronger thread than if it were cut. It appears that there are a great many articles used in car construction that may be made to advantage by this process. They are making the pins for standard brake rigging, and finish them almost as accurately as if they were turned in a lathe. This rolling process is much better adapted for doing accurate work than any other, for the thickness of any article is regulated by the distance the movable bars are kept apart, and this distance can be regulated as closely as ordinary callipers can be set. It is said that the threads of the rolled track bolts are so strong that they cannot be stripped by using an ordinary track wrench. It is thought that this would be a good process for the making of follower bolts, cylinder-head studs, steam-chest bolts and all other kinds of bolts and studs that are frequently broken by the tightening of nuts, causing much delay and inconvenience.

THE NAIL MANUFACTURE.—A correspondent of the *American Manufacturer*, in discussing the nail situation in Pennsylvania, says: During the past year there have been no improvements in methods of manufacture introduced, and no material changes have taken place. The use of pickled iron instead of the old scale iron plates has become much more general and has proven a great help to the business. Few iron nails are now made. Probably 1000 kegs would cover the entire product for the year, and they

were made on special orders sent in by consumers unfavorable to the steel nail. It is generally supposed that the wire nail is to blame for the general depression of the nail trade and the light demand, but Wheeling manufacturers insist that such is not the case. They say it is questionable whether the wire nail is increasing its percentage of sales as rapidly as the consuming capacity of the country is increasing. The cut-nail men say they met no opposition from the wire-nail men, and that the depression in their business is due to the rapid increase in the producing capacity, and the consequent overproduction.

COMBINED TOOLS AND HANDLES.—There has always been a difficulty in connection with what are known as hand-tools, such as hammers, picks, etc., in making an effective strong joint between the tool and handle. While the tool itself should be possessed of a definite and sufficient weight, the handle should be as light as compatible with strength, and for this purpose wood is the material that has hitherto been generally employed. But while this material has advantages in its favor besides that of a very general use from probably pre-historic times, there are disadvantages which are often too evident; these are want of strength, and looseness in the joint with the tool. The invention and introduction of the Mannesmann process for the production of tubes direct from metal blocks has rendered the invention of a tool combined with its handle possible. By means of the Mannesmann process, tubes can be produced having solid portions at one or more points of their length. These tubular rods may be made in any convenient lengths, with solid portions at regular or irregular distances apart, so that by cutting through each solid portion the rod can be divided up to a corresponding number of blanks for tools. By cutting each bar through at convenient points, each section will consist of a hollow part, which may be suitably shaped or bent to form the handle, and the solid part, which can be shaped into the tool-head by forging or stamping. Various tools are so formed, and it is obvious that they possess greater strength and durability than tools of which the handles form a separate piece.

A PECULIAR PHENOMENA IN WELDING.—Iron is now plated with nickel by pressure between rolls at a welding heat, the nickel being recovered from the clippings and shearings of the plates by the action of dilute sulphuric acid at a temperature of 55° C.; the iron is dissolved and the nickel is obtained in the form of thin sheets as it was melted upon the iron. The operation is complete when the evolution of hydrogen ceases—even fresh acid, at the same temperature, has practically no effect. But though the separation of the two metals is apparently perfectly made, a curious fact is noted, namely, that when the residual nickel is chemically examined it is found to differ from its original composition, the amount of iron present being notably increased. For example, in a nickel containing originally only .09 per cent of iron, 2 per cent more was found when it was recovered from the plate cuttings, and, even by a long-continued treatment with dilute acid, the iron could not be sensibly reduced. This peculiar behavior, it is believed, points to the possibility of positive chemical combination taking place between the metals, and that alloys of iron and nickel are produced in the process of welding—it being a fact well known to chemists and metallurgists that iron, with but even a small proportion of nickel, resists the action of acids much more effectively than the pure metal.

ELECTRIC WELDING MACHINES are coming rapidly into use. The company manufacturing these machines at Lynn, Mass., has orders for several months ahead of the capacity of the possibility of the supply. The company has a number of orders from the U. S. Government, one of which is for two large machines for welding steel for the navy-yard at Brooklyn and Norfolk. The machines will be of 100-horse power, and will be provided with accumulators and compressors. A machine to weld 2-inch chain is now being finished for the Charlestown Navy-Yard. It will weld steel as well as iron, and by the use of steel the tenacity of the chains will be increased about one-third. One of the welding machines is used by the Government at the Watervliet Arsenal for winding guns.

METAL FOR ELECTRO MAGNETS.—Speaking of mild metal in his recent lectures on "Magnets," Prof. Silvanus Thompson states that he has found this metal far superior to ordinary cast iron, and not much inferior to wrought iron, for electro-magnets. It is well known that the field magnets of dynamos and motors are made to certain forms, mainly to avoid expensive forging on the one hand or inferior results with cast iron on the other. In most cases a compromise is made by using good wrought iron for the straight cores and cast iron for the pole pieces, the latter involving difficult work, if forged out of wrought iron.

A "WATER ANNEAL."—It is now recommended as a good method of annealing steel to let it "soak" in the fire until red hot, as it heats more evenly, then take it from the fire and carry it to some dark place, allowing it to cool in the air until the dull red is no longer obtrusive in the dark, and finally cooling it off in hot water. This process is called the "water anneal."

SCIENTIFIC PROGRESS.

What Causes Expansion.

Why is it that all bodies expand when subjected to an increase of temperature? and why is it that some bodies expand more than others under the same conditions? It is well understood that all matter consists of an agglomeration of atoms and molecules, that these are subject to certain changes by the influence of heat, and that such change is accompanied by a change of volume of the mass. Heat has been demonstrated to be a mode of motion, and from this we must conclude that all bodies which contain heat are possessed of motion, and the greater the temperature the greater the motion. Those who have investigated the subject to their satisfaction have found that there is a temperature at which there is an absence of all heat.

Heat and cold are but relative terms, and do not refer to anything material, but are the results of more or less intense motion within the mass. As all bodies are affected by heat in a similar manner, but not to the same extent, different bodies expand more or less under the influence of an equal increase of temperature. Solid bodies, or those which for convenience are called solid (in reality no body is solid), expand the least. Liquids are affected to a greater extent, while gases expand more than either when subject to the same increase of temperature. Air and most other gases appear to follow a certain law in expanding and contracting. This law may be stated thus:

The volume of a gas under constant pressure, or the pressure of a gas at constant volume, varies as the absolute temperature. Absolute temperature is understood to mean the temperature reckoned from a point far below the zero of any of the thermometers commonly in use. This point is called the absolute zero of temperature, or the temperature at which it is considered that no heat exists. If such is the case, and none of the phenomena of heat are manifest at this temperature, then wherever such temperature is found there would be no movement whatever, everything would be—not dead really, for heat would restore movement, but in a far different condition from what we are accustomed to find them.

The absolute zero of temperature is 461° below the zero of the Fahrenheit scale, or 273° below the zero of the Centigrade scale—a temperature at which all substances are devoid of motion, for motion cannot exist without heat—no motion, no heat. Cold and motionless in the fullest sense of the words. The absolute zero of temperature has never been reached by any physical research, but in laboratory experiments a temperature of 373° F. has been produced by expansion in liquefying air, oxygen and nitrogen. This temperature is more than four-fifths the distance between the zero of the Fahrenheit scale and that of the absolute zero.

Were it possible to reduce the temperature 88° more, the liquefied air would become a solid, devoid of atomic motion, contracted, compressed, an absence of all heat. From this condition a slight addition of heat imparts movement to the atom, which causes dilation of the mass; it expands. More heat being added, the velocity of movement is increased and the volume of the mass grows greater. In the case of a solidified gas, the increase of temperature continues to produce expansion in the body until the temperature of liquefaction is again reached; but here a temperature due to both a solid and liquid condition is maintained, while the mass absorbs a given amount of heat and is wholly changed into a liquid before any increase in temperature is apparent, the surplus heat being necessary to produce the work required to bring about a change of form, and this heat is absorbed and becomes latent, until the liquid again becomes solid, when the same amount of heat that was absorbed is set free.—*Correspondence of the Manufacturers' Gazette.*

HOW ELECTRICITY IS "STORED."—The energy which a current may at any instant be said to possess is immediately transformed into heat in the circuit, which will under certain conditions produce light; into chemical energy; into motion, which may or may not produce sound; or into magnetic and electrotonic conditions. The last may either be permanent or have the same evanescent existence as the original current. When electricity is employed to charge a storage battery, writes Prof. Samuel Sheldon in *Popular Science Monthly* for January, only that part which is transformed into chemical energy is need. The rest is dissipated. The battery, then, instead of being a place where electricity is laid away, is a place where chemicals are left by the current, with the expectation that they will in turn produce a current when called upon. This may seem a fine distinction, but it is only apparently so. For instance, the current might be produced by a dynamo turned by Niagara water-power. The chemical left by it might be zinc deposited from a solution of zinc sulphate. This might be transported, preserved, bought and sold, and finally be employed by some physicist to produce another current. Were the electricity itself stored in its original form, then the imaginative reader can best tell what would become of it and how it must be handled.

DANGER OF FIRE FROM THE USE OF CHLORATE OF POTASH.—Attention has been drawn to

the danger of fire in the use of chlorate of potash, sugar and nitrate of ammonia in the manufacture of tablets. While it is generally known that chlorate of potash, together with organic matter, forms a powerful explosive, it should be understood that, under certain conditions, it is an agent in producing fire without an explosion. Sugar alone requires a temperature of 600° F., and if an accumulation of dust or particles of the two ingredients named should form a mixture on the steam pipes of a factory, a fire might be caused. It is, therefore, urged that the manufacture of the chlorate of potash and nitrate of ammonia tablets should be restricted or prohibited as being dangerous to the welfare of the community.

Influence of Light on Color.

Some years ago an English manufacturer of carmine, who was aware of the superiority of the French color, went to Lyons for the purpose of improving his process, and bargained with the most celebrated manufacturer in that city for the acquisition of his secret, for which he was to pay \$5000. He was shown all of the process, and saw a most beautiful color produced, but he found not the least difference in the French mode of fabrication and that which had been constantly adopted by himself. He minutely examined the water and the materials, which were in every respect similar to his own, and then, very much surprised, said: "I have lost both my labor and my money, for the air of England does not permit us to make good carmine."

"Stay!" said the Frenchman, "don't deceive yourself; what kind of weather is it now?" "A bright, sunny day," replied the Englishman.

"And such are the days," said the Frenchman, "on which I make my color; were I to attempt to manufacture it on a dark and cloudy day, my results would be the same as yours. Let me advise you, my friend, only to make your carmine on bright, sunny days."

The moral of this will apply quite as well to the making of many other colors used in manufactures and also in the fine arts, for it illustrates, in a practical way, the chemical influence of light upon certain coloring compounds or mixtures.

POISON-PROOF ANIMALS.—Neither difference of organization in animals nor in the constitution of the poisonous substance generally afford any clue for interpreting an exceptional want of effect, writes W. Bernhardt in *Popular Science Monthly*. Unaccountable is the immunity of rabbits against belladonna leaves (*Atropa belladonna*, deadly nightshade). You may feed them with belladonna for weeks without observing the least toxic symptoms. The meat of such animals, however, proves poisonous to any one who eats it, prolonging the same symptoms as the plant. Pigeons and various other herbivora are also to some degree safe from the effects of this poison, while in warm-blooded carnivora it causes paralysis and asphyxia. In frogs the effect is a different one, consisting of spasms. The meat of goats which had fed on hemlock has sometimes occasioned poisonous effects. Chickens are nearly hardy against nuxvomica and the extremely dangerous alkaloid, strychnine, contained in it, while in the smallest amount it is a fatal poison to rodents. More remarkable yet in this respect is the immunity of *Choleopus Hoffmanni*, a kind of sloth, living on the island of Ceylon, which, when given ten grains of strychnine, was not much affected. Pigeons are possessed of high immunity from morphine, the chief alkaloid of opium, as well as from belladonna. Eight grains were required to kill a pigeon, not much less than the mortal dose for a man. Cats are extremely sensitive to fox-glove (*Digitalis purpurea*), which on the contrary may be given to rabbits and various birds in pretty large doses.

PINTCH GAS is a new illuminating gas coming into use for lighting cars, etc. It is a distillation from crude petroleum, and is produced by passing the oil through heated iron retorts. The product, a permanent gas of great richness and brilliancy, is then forced through water seals which thoroughly purify it. Finally it is stored in cylinders of unusual strength, where it is subjected to a pressure of 150 pounds to the square inch. These cylinders are placed beneath the coaches and by means of an automatic graduating valve, which insures uniform pressure, the gas is conducted to the lamps above, where it yields a light which is four times as powerful as ordinary gas light.

TELEGRAPH AND TELEPHONE MESSAGES are now sent over the long-distance telephone wires at the same time that they are in use for telephonic communication, without one interfering with the other. This may give the country a telegraphic system which will prove a successful rival of the Western Union.

SULFUROUS ACID is now being used to act upon starch under pressure and at a high temperature. The product, after neutralization, is Schumann's universal gum, which is soluble and extremely adhesive, and closely resembles gum arabic, which is now very scarce and dear.

A PLEASANT HOUSEHOLD DEODORIZER is made by pouring spirit of lavender over lumps of bicarbonate of ammonia.

GOOD HEALTH.

THE PATHOLOGICAL EFFECTS OF THE ELECTRIC LIGHT.—Attention has been drawn to the advisability of the adoption of early remedial measures by those who are suffering from the effects of a too long exposure to strong electric light. The "tired" sensation in the optic nerve, which such exposure causes, and the local inflammation which accompanies it, are both due to the fact that the luminous waves proceeding from a powerful electric lamp are of very great intensity. The general symptoms induced in the eyes of people who have been exposed to the glare of unprotected lamps for too long a time are: 1, transient irritability of the retina; 2, local inflammation; 3, tears and "dashing" of light before the eye; 4, incipient paralysis of the eye. Usually people experience sensations which are analogous to those which are felt when particles of foreign matter are present beneath the eyelid. In order to prevent the sight being permanently injured, it is necessary to adopt hygienic shades, though these do not act thoroughly in reducing the intensity of the luminous waves. Rest must be sought and the pain relieved by the application of cold-water compresses. When the pain is almost unbearable—a calamity frequently suffered by those who have been exposed for many hours a day to the glare of powerful lamps—a medical man may relieve it by the injection of cocaine and atropine. The French call this peculiar malady "electrical sunstroke."—*Ex.*

DIPHTHERIA IN CHEWING-GUM.—A contemporary thus calls attention to the possible spreading of diphtheria through chewing-gum: "The practice of chewing gum has become very wide spread. It is not a very elegant habit; to many it is positively repulsive; and there are scores of danger, too, that should not be overlooked. A case in point was related to us a few days ago. Diphtheria broke out in a family in East Des Moines. After the child had recovered, the clothing and all the exposed articles fully disinfected, the parents, with the convalescent child, visited some relatives in the country. The indispensable chewing-gum, like Sataw, went also—in the mouth of the little child. Prompted by generosity, it allowed its country cousins, two children, to chew also the gum previously chewed by the visiting child. In three or four days, without any other known source of infection than the chewing gum, the two children were simultaneously stricken down with diphtheria in a most serious form. It would be hard to imagine a more successful mode of propagation—distributing the disease. It would be a great deal safer not to chew the stuff at all, but if it must be done to satisfy the demands of a weak head and a depraved appetite, our advice is, don't 'swap' gum to chew anybody's else gum, nor allow anybody else to chew yours."

CURATIVE USE OF CHARCOAL.—Charcoal is valuable as fuel, but it has other uses which make it one of the most serviceable of articles. When laid flat, while cold, on a burn, it causes the pain to abate; by leaving it on for an hour the burn seems almost healed when the wound is superficial. Tainted meat, surrounded with it, is sweetened. Strawn over heaps of decomposed pelts or over dead animals, charcoal prevents unpleasant odors. Foul water is purified by it. It is a great disinfectant, and sweetens offensive air if placed in shallow trays around apartments. It is so very porous that it absorbs and condenses gases rapidly. One cubic inch of fresh charcoal will absorb nearly 100 inches of gaseous ammonia. Charcoal forms an excellent poultice for malignant wounds and sores. In cases of what is called pruritis, it is invaluable. It gives no disagreeable odor, corrodes no metal, hurts no texture, injures no color, is a simple and safe sweetener and disinfectant. A teaspoonful of charcoal in half a glass of water often relieves sick headache. It absorbs the gases and relieves the distended stomach, pressing against the nerves which extend from the stomach to the head.

RECOVERATIVE POWER.—The ready recovery from wounds and the success of grave surgical operations during our Civil War, under circumstances which were, on the whole, less advantageous than those which attend the conduct of war in Europe, prove that the American body has more recuperative power than that of the European.

IN A FAINT.—The common practice of raising fainting persons to sitting or upright position is often sufficient to destroy the spark of life which remains. It is much better to keep such persons in the prone position while restoratives and local means are adopted to enable them, if possible, to regain consciousness.

FOOTBALL CASUALTIES.—The London *Lancet* furnishes this list of football casualties from all over the world during the last season: Deaths, 13; fractures of legs, 15; of arms, 4; of collar-bones, 11; serious injuries to spine, 5; to nose, 1; to knee, 1; to ankle, 1; to cheek, 1.

HARTLEY'S PROCESS.—A small plant for reducing the rebellious ores of Meadow Lake district has been put up by Mr. Hartley at Cloco, and will be run as soon as a thaw releases sufficient water. The process is Hartley's invention, and it is said that no trace of gold is left in the tailings.—*Placer Republican.*

STEAM BOILER NOTES.

HIGH-PRESSURE BOILERS.—The fear of high-boiler pressures that existed only a few years since in the minds not only of the public, but also of many engineers, is rapidly disappearing before the results of modern practice; and it is furthermore asserted that the statistics of boiler explosions in England and France prove that the low-pressure boiler explosions have been the more frequent and more disastrous. Several reasons have been given for this, but the following would seem to be the most conclusive: The law requires that every new boiler and every old one, after it has undergone extensive repairs, shall not be sent out of the shop or be put into service until it has been tested to double the effective pressure under which it will be worked. A heavy boiler which is to work with a pressure of 120 pounds to the inch must be able to carry from 240 to 300 pounds pressure, which corresponds to a temperature of from 397 to 416 degrees F. These are conditions that will rarely be attained, even with the most careful attendance; while it is comparatively easy to rupture a low-pressure boiler, since the test pressure may not exceed 45 or 60 pounds at the most, and this corresponds to a temperature of from 274 to 292 degrees F., these pressures being regarded as the absolute above the vacuum, as that is the basis upon which the foreign boilers are tested. It will readily be seen that the latter temperatures are readily reached, even with slow fires. Furthermore, high-pressure boilers require more perfect construction, on account of the very weakness that they have a tendency to develop. The sheets in contact with the water and steam radiate an amount of heat that is quite intolerable to the attendants, and they must, therefore, be covered with non-conducting materials and air spacer, and this involves constant care and attention. Their advantage is so apparent, from the success attending their use, that the whole tendency of modern steam-engine practice is toward higher pressures and the use of engines with a high rate of expansion, whether they are used with or without a condenser.—*Safety-Valve.*

FOAMING IN BOILERS.—When boilers are new and first used, they are liable to foam, in consequence of grease or oil left in them during their manufacture. The simplest remedy for this is to put from one-half to one pound common washing soda in the boiler when first filled with water. After steam has been raised and the soda has neutralized the oil and grease, draw the fire, and when the pressure of steam has been reduced to not exceeding five pounds, blow out the boiler, then fill with fresh water, adding a very small quantity of soda to neutralize any grease remaining within the boiler. The general cause of boilers foaming is using the steam faster than the fire is generating it, as any boiler can be caused to foam by drawing the steam from it faster than it is being generated. The remedy in this case is to close the throttle so as to reduce the quantity of steam discharged in proportion to the amount being produced, increase the fire so as to make more steam, and the quantity available for service will be in accordance, without danger of foaming.—*Safety Valve.*

WASTE OF STEAM.—Every stroke an engine makes above its normal speed is a waste of steam, and if the engine be large, a vast waste of fuel takes place; on the other hand, a loss in speed reduces the production of the whole factory in direct proportion to that reduction of speed, the loss of one revolution in twenty reducing the capacity of every machine five per cent. A variation of one revolution in five in a throttling engine is common, and in most cases is unavoidable. There are some engineers who still think that this class of engine can compete with the automatic cut-off engine, but it is, nevertheless, a remarkable fact that they take every precaution to avoid throttling in the passages. Happily these relics of a bygone age are becoming fewer in number. If the practice of estimating the efficiency of a steam engine by its consumption of steam were more common in this country than it is at present, we should hear very little of "throttling." The present practice of estimating the efficiency by the coal consumption (involving as it does the efficiency of both the engine and the boiler), is fair neither to the maker of one nor the other.

THE STEAM CYLINDER.—A good deal of recent discussion brings out prominently once more how little the wisest really know about the behavior of steam in the cylinder of a steam engine. Just now the discussion as to the utility of the steam jacket is in the front, and the conflicting testimony and opinions are anything but reassuring. The unprejudiced engineer is likely to conclude, from all this discussion, that there are cases where the steam jacket represents economy; also that there are cases where it brings about the reverse. But just what brings about this difference no one is wise enough to tell. What is needed is further knowledge of the law governing the condensation of steam in the cylinder of a steam engine; how it is affected by different conditions, etc. Then from this as a standpoint, figures can be made to apply to steam jacketing. Until a good deal more is learned about condensation of steam, the doctors will disagree as to the value of any means tending to prevent it.—*American Machinist.*

USEFUL INFORMATION.

WASH SILKS AND RAMIE.—The class of goods known as "wash silks" contain, in reality, but very little of the product of the silkworm. Like most inexpensive oriental silks, wash silks consist largely of ramie fiber. This superior vegetable fiber has long been used in the makeup of silk goods. It is about as fine as the product of the silkworm, and is finer and stronger than flax. Ramie is often mixed, carded and spun with silk floss and waste. Pongee silks are commonly composed of this mixed material. Wash silks often consist of a wool of one material and a web of the other. They are always calendered—that is, passed over hot rollers to give them a gloss silken finish. This makes them more attractive on the shop counters, but causes them to spot with water until this finish has been removed by sponging. The improvements made of late years in the manufacture of ramie have materially affected the cost of low-priced silks, and bid fair in time to make such "silks" as cheap as cotton, especially when the superior wear of the former is taken into account. There is no reason why ramie should not be sold under its own name. It has virtues of its own apart from silk, one of which is that it can be washed, and it certainly is not improved by mixing with silk. An effort is now being made to establish ramie culture in this State, for which our climate and soil afford special advantages. It will grow almost anywhere in the State, even on our poorest or worn-out wheat-lands. It is said that even a moderate amount of alkali is no hindrance to its growth or quality.

FIRE PROOF SHUTTERS.—A useful invention has been brought to notice—namely, a device for opening and closing fire-proof shutters from the outside with water pressure from the hose, and their easy operation from the ladder, under the management of the fire department. The mechanism provided for opening and closing the shutters from the inside without raising the windows, is a feature of special convenience and protection to the occupants of a building. This device, it is stated, can readily and inexpensively be applied to the ordinary shutters in use.

WHITE PITCH is a new article coming into use for ship-builders and others. It is designed to supersede the usual laborious, expensive and inadequate method of treating decks by working putty into the seams with a knife. The peculiarity of this white pitch is, as claimed, that it is the only material of white color yet introduced that can be run into deck seams in a hot state like ordinary pitch. It is also said to be especially suitable for hot climates, as it will stand the sun's heat and not melt out of the seams.

A STARTLING ADMISSION.—"What becomes of all the stale candy?" was asked a well-known confectioner. "It is made up into fresh candy." There is not an ounce of waste about confectionery. You like obnoxious caramels? Well, they contain more scraps than any other candy. They are especially adapted for this on account of their dark color. They were first made by a confectioner who received the inspiration from his great stock of stale sweets.

THE LUMBER CUT of the northern coast for 1890 is set down as follows:

	Feet.
Puget Sound Mills (14).....	779,330,012
Gray's Harbor (7 mills).....	117,500,000
Willapa Harbor (2 mills).....	38,000,000
Columbia River (7 mills).....	87,000,000
Between Kalama and Tacoma (11 mills).....	93,000,000
All others (16 mills).....	108,000,000
Grand total.....	1,222,330,012

BEAUTIFUL EFFECTS may be imparted to water-color drawings by causing gold to shine through some of the transparent colors. This is done by attaching gold leaf with mucilage to shaded parts, the gold leaf being taken up and pressed down with cotton wool. As leaf gold will not receive water colors regularly, it should be first stroked over with some water or oil.

SWORD SCABBARDS are now made so that when the sword is withdrawn the upper part of the scabbard contracts to one-half its length, and consequently is much more convenient during the period of action. When the sword is returned to the scabbard, it resumes its usual form.

A MINING COMPANY'S CLAIM.—An action has been brought in the United States Circuit Court by the Waterloo Mining Company to recover \$462,000 from John S. Doe and Bartlett Doe. The complaint sets forth that in February, 1889, the defendants took 30,000 tons of ore, valued at \$30 a ton, from the Silver King and Quartz Mining Claim, and \$162,000 worth of ore from the Monmouth and Red Cloud tunnels, both of which properties belonged to plaintiff. Also, that since the 10th inst., the defendants have taken \$50,000 worth of ore from these same properties.

THE Southern Pacific Co., after test trips to see whether wood or coal was cheaper for running their locomotives over the mountain division, find that there is a slight advantage in favor of coal.

ELECTRICITY.

The Science of Electric Welding.

A paper of considerable length, and very comprehensive in its exposition of the science of electric welding, was read by Hermann Lemp before the general meeting of the American Institution of Electrical Engineers at Boston, May 21, 1890. From it, as reported by the *Electrical World*, the following extracts are gathered:

Among the latest achievements in electro-technics stands prominently Prof. Thomson's electric welding process. The broad underlying principle has often been described and exhibited. The evolution of a new process and its reduction to practice for commercial purposes, especially if the leading elements of its working are novel in themselves, must necessarily open a vast field for investigation. Such is the case with electric welding; and with a view of showing the commercial apparatus of to-day, it will be necessary for me to state the electrical and mechanical requirements that led to its construction.

The reason for which machines have been invented has been for the purpose of reproducing faithfully and constantly a set of conditions necessary to obtain a certain result. When the conditions in any case are few and the product simple, generally the design of machine will be sufficient. With an increased number of conditions, however, the complexity of the apparatus increases rapidly and demands, in many cases, subdivision into different processes to be executed by separate machinery. What constitutes skill, in a workman, for instance, is the ability co-ordinately to reproduce a number of operations or movements; to be, in other words, a perfect machine, or to produce the same result even if other conditions than those previously contemplated should arise.

To secure uniform results in the practice of a difficult operation, there are two ways possible:

1. To employ skilled help for the complex portion of the work alone.
2. To substitute for the more complex portion of the operation one more readily controlled.

The ordinary welding process requires the greatest skill at the hands of the blacksmith for heating the metals to the proper temperature and at the right spot, while preventing the accumulation of cinder or scale. While skill may be successful with metals of high melting points and low conductivity for heat, easily fusible metals and especially good conductors fail all attempts as long as an exterior heating source is employed.

The electric welding process has not only made it possible that operators not particularly skilled in the art of blacksmithing can produce good substantial welds, but has created an art equally adaptable to all metals and combinations of metals.

The following are all the metals, alloys and combinations so far actually welded with success by the Thomson process:

Metals.
Wrought iron, cast iron, malleable iron, wrought copper, cast copper, lead, tin, zinc, antimony, cobalt, nickel, bismuth, aluminum, silver, platinum, gold (pure), manganese, magnesium.

Alloys.
Various grades of tool steel, various grades of mild steel, steel castings, chrome steel, malleable steel, brass steel, crescent steel, Bessemer steel, cast brass, gun metal, brass composition, fuse metal, type metal, solder metal, German silver, aluminum alloyed with iron, aluminum brass, aluminum bronze, phosphor bronze, silicon bronze, coin silver, various grades of gold.

Combinations.
Copper to brass, copper to wrought iron, copper to German silver, copper to gold, copper to silver, brass to wrought iron, brass to cast iron, tin to zinc, tin to brass, brass to German silver, brass to tin, brass to mild steel, wrought iron to cast iron, wrought iron to mild steel, wrought iron to tool steel, gold to German silver, gold to silver, gold to platinum, silver to platinum, wrought iron to malleable steel, wrought iron to steel, wrought iron to crescent steel, wrought iron to cast brass, wrought iron to German silver, wrought iron to nickel, tin to lead.

But Prof. Thomson was not satisfied with this progress made above ordinary welding; he early recognized the importance of a machine in which all conditions for successful operations are mechanically controlled to produce uniform results, work rapidly and require little or no attendance.

Such machines, now known as automatic welding machines, have proved to be of special importance in connection with easily fusible metals, enabling the successful welding of aluminum, silicon and aluminum bronze, which require even with the electric process a considerable skill. The machines are very simple in the construction and operation, and require less skill than is requisite in ordinary welding operations.

A NEW mining district has been formed on the East Fork of the Walker river, Nev., including the recently discovered or evolved placer diggings.

SHASTA, Shasta Co., wants a custom quartz mill and reduction works.

TABLE OF CONTENTS.

EDITORIALS.—The Bear Valley Dam, 65. Passing Events; The State Mining Bureau; Mining-Law Changes; Electric Roads, 73. Peruvia Mines, 73.

ILLUSTRATIONS.—The Bear Valley Dam Illustrated, 65, 73.

MISCELLANEOUS.—San Bernardino County; The Free Coinage Bill; Mining Corporations; Silk in California, 66; Notes from California; Mineral Lands; Fresno Coal, 67.

MECHANICAL PROGRESS.—Cold Saws in Shipbuilding; Rollers, Belts and Threads; The Nail Manufacture; Combined Tools and Handles; A Peculiar Phenomenon in Welding; Electric Welding Machines; Metal for Electro-Magnets; A Water Anneal, 70.

SCIENTIFIC PROGRESS.—What Causes Expansion; How Electricity is Stored; Danger of Fire from the Use of Chlorate of Potash; Influence of Light on Color; Poison-proof Animals; Plintch Gas; Miscellaneous, 70.

GOOD HEALTH.—The Pathological Effects of the Electric Light; Diphtheria in Cheewing Gum; Curative Use of Charcoal; Recuperative Power; In a Faint; Football Casualties, 71.

STEAM BOILER NOTES.—High Pressure Boilers; Foaming in Boilers; Waste of Steam; The Steam Cylinder, 71.

USEFUL INFORMATION.—Wash Silks and Ramie; Fire-Proof Shutters; White Pitch; A Startling Admission, Miscellaneous, 71.

ELECTRICITY.—Science of Electric Welding, 71.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 68-69.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 76.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 76.

Passing Events.

It will be a matter of surprise to other communities to know that a California Legislature has amended a bill before it so as to practically prohibit the construction of electric roads operated by the overhead wire system. As this system is the only one thus far practically operative, it is a virtual prohibition of electric roads in cities of the first class. The amendment is not conclusive, however, and the more liberal members may yet see the mistake that has been made.

The explosion in the Mammoth coal mine, Pennsylvania, by which 151 men lost their lives this week, was one of the most disastrous accidents in the history of American coal mining. Naked lamps were used, as the mine was not considered dangerous, but this terrible disaster will doubtless result in more stringent measures being taken in the collieries of the district for the protection of the miners.

The continued dry weather this winter is not good for the best interests of the State. Not only do the agriculturists suffer, but now that water-power is so largely used in mining, it is probable the miners will suffer from a scant supply next season.

A PACIFIC CABLE.—Senator Mitchell has introduced a bill to incorporate the Pacific Cable Company, with a capital of \$5,000,000, to operate a cable between San Francisco, Hawaii, Panama, Samoa and Japan. The majority of the directors must be citizens of the United States. The Secretary of the Treasury is authorized to pay to the company an annual subsidy of \$200,000 for 15 years.

By an explosion in the Mammoth shaft of the H. C. Fricke Coke Co.'s mine, Scottdale, Pa., on Tuesday last, 151 miners were killed and several others injured.

The State Mining Bureau.

A Well-Managed Institution and Much Good Work Done.

If, in his search after fossils, the skillful paleontologist come upon any hit of animal remains, however ancient or however unique, he will be able to reconstruct the creature to which they belong, describing its size, habits and appearance with wonderful accuracy. The fragment inspected may consist of only a single bone, and yet our man of science will tell you, with much exactness, the style of animal of which it originally formed a part, and this even though such animal were of strange and monstrous form, and belonged to a race extinct long ago.

In like manner would the archaeologist, visiting our public libraries or rummaging through the crypts and lumber-rooms of the Capitol, conclude, from some fragments of maps, field-notes and odd volumes there found, that there had once been a geological survey of this State planned and partially completed. Studying the character of these remains, our archaeologist would arrive at the further conclusion that this survey had been projected, and, so far as carried out, prosecuted on a grand, costly and comprehensive scale, all which speculations and conclusions would be entirely correct, for the people of California, now many years ago, really did undertake and carry through its preliminary stages a work of that kind—a law having about that time been enacted by the Legislature making provision for the same. In pursuance of this law, Prof. J. D. Whitney, a most capable man, was selected to take charge of this work, which, when it had been in progress for two or three years, was arrested through failure of the Legislature to make further provision for its support. Of this failure it is enough here to say it worked every way to the prejudice of California, hurting alike her good name and the material interests of the State.

Later on, it began to dawn on the popular mind that a great mistake had been made in thus permitting the Whitney Survey to be prematurely strangled to death. Looking abroad, it was perceived that almost every other country in the civilized world had made provision for having its geology and its mineral resources examined and reported upon in an official way. States making no pretensions to a large mineral wealth, and several of them not half the size of some California counties, had yet thought it worth while to give careful attention to such slender resources in this line as they happened to possess. Some of these sovereignties, though they had little else than granite and marble to boast of, kept, nevertheless, a learned geologist all the while in the field, and from whom an elaborate report was yearly exacted.

Seeing all this, and noticing how strongly it contrasted with conditions at home, our people finally determined that another effort should be made to create the office of State Geologist or something that would serve in its stead. In accordance with this determination, the Legislature at its session in 1880 passed an Act creating the office of State Mineralogist, and at the same time an institution known as the State Mining Bureau, to be superintended by that official, for the support of all of which very scanty provision was made. In remarking on the insufficient outfit of the Bureau, a city daily makes the statement that it consisted of no more than "a microscope and a table," to which, however, should have been added a chair of the cheap wooden sort.

Thus equipped and provided for, the first State Mineralogist, Henry G. Hanks, commenced business, opening up in the third story of a dilapidated building on Pine street. The establishment became perpetually from the start, the endeavor to realize always a lower rent having compelled its frequent removal from one rookery to another. In these removals, effected at first with a wheelbarrow and later on with an express wagon, we have the earliest conception of "California on Wheels!"

But despite these adverse beginnings, the institution kept on its feet and grew apace. Hanks was a hard worker, and besides discharging the duties pertaining to his official position, managed to get through with much else, a good deal of it mere drudgery, his single assistant doing the while as janitor, messenger, assayer, librarian, etc. What rendered the

task of both the more arduous was the fact that neither of these men had then learned, nor have they since learned, the art of shirking any duty imposed upon them or of slighting any work given them to perform.

Picking up where he could, or acquiring through donations made by individuals, or by means of exchanges effected with similar institutions elsewhere, the first State Mineralogist gradually accumulated a very respectable mineral cabinet, which, through recourse to like methods, has since been kept growing by his successor, Wm. Ireland Jr., present incumbent of the office. Meantime, California, mainly through the exertions of the Mining Bureau, succeeded in having her mineral and other more important sources of wealth fitly represented at the Paris and afterward at the New Orleans Exposition, and at neither of which would the State, but for these exertions, have been able to make anything like a creditable display, or perhaps any display whatever.

Tracing down the history of the Mining Bureau, we find it adding to its mineral collection and its art treasures year by year, the objects of its care having been at the same time greatly multiplied and the sphere of its usefulness much extended. Besides the many benefits it has conferred on our several mining industries, aiding them in all their departments and branches, the Bureau has been of no little service to our agricultural, commercial and manufacturing pursuits. There is not, in fact, an interest or calling in the State but what has been greatly helped by it in either a direct or an indirect manner.

While accomplishing so much good, this institution has virtually cost the State nothing. It is calculated by competent judges that the collection of mineral specimens, curiosities and articles of virtue gathered up and now on exhibition in the museum of the Bureau possesses an intrinsic or commercial value equal to all the money that has been appropriated for the uses of this institution since it was founded; in other words, this magnificent collection stands a free gift to the commonwealth of California!

Has any other arm of the public service done better than this? We think not; nor do we believe any other can show a better financial record. The State Mineralogist has been able to account satisfactorily for every dollar that has passed through his hands or been intrusted to his care. The Bureau has been in nothing delinquent, nor has it been hemisrched with any scandal whatever. Its history is a clean one, creditable alike to the State and the men who have been responsible for its management. In view of all which it is to be hoped that the Legislature will feel warranted in voting this institution such allowance as will enable it to continue the geological survey already begun and suffice to maintain it in its present state of efficiency. To compel now, through an insufficient appropriation, an abandonment of that work, or to otherwise cripple the usefulness of the Bureau, would prove very disappointing to its many friends, both at home and abroad. We will not, however, insult the intelligence of the Legislature by presupposing it capable of pursuing a policy so short-sighted and illiberal. Consulting alike the desire of the miners and the interests of the State at large, we believe our law-makers now in session at the capital will, before they adjourn, make ample provision for the support of this highly popular and well-deserving institution.

Mining-Law Changes.

We republish this week the text of the Mineral Land bill now pending in Congress, adding those sections which were omitted in the Press in the previous publication. Some amendments to the text have been made by the House Committee, but these have not yet been acted upon.

It will be noted that where there are five adjoining claims owned or held by the same person, the assessment work done on one will answer for all, provided \$500 is expended.

The month in which assessment work shall be completed is also changed from January to October, so as to avoid the necessity of beginning the work in mountainous regions in mid-winter. There is also a very radical change in that matter of date. Under the new bill it is provided that half the work must be done before October 1st, and the other half may be done after that date. This is to prevent the

present plan of not doing any work at all until the morning of the day when the time is up.

It is also provided, in cases of contest as to the mineral or agricultural character of the land, that the presence of rock in place bearing gold, silver, cinnabar, or other valuable metal, shall be regarded as prima-facie evidence that the land containing the same is mineral in character. So far, so good, but this should go further, and require the affidavit of a deputy mineral land surveyor or other expert. The trouble now is that the proof required is negative, that is, the agricultural claimant says, as far as he knows, there is no mineral, and unless there is some one to disprove this and show there is mineral, the land goes to the agricultural claimant. In this way much valuable mineral land has been illegally withdrawn from the public domain, where a simple examination would often show the presence of mineral.

The bill has not yet become a law, and there may be many changes in the text before it does.

Electric Roads.

Under the present laws of California, there is no warrant for large cities granting franchises for electric railroads, and the matter was brought to the attention of the present Legislature in order that a suitable amendment could be made permitting the legal construction of these roads. Several have been projected in Oakland and other cities; but the councils or supervisors would not grant the franchise. In both San Francisco and Oakland the mayors have vetoed electric road franchises for legal reasons.

Strange to say, the Legislature is not inclined to pass the necessary laws permitting the construction of these roads. It reconsidered a bill drawn in the interest of these roads, and amended it so that only those operated from an underground conduit or by storage battery could be permitted, thus shutting out the overhead wire system, the only one of practical value. There are as yet no practically successful underground or storage system electric roads.

This action of the Legislature has brought out many wild statements concerning electric roads, and the uninformed reader might imagine the cable and all other street-car systems doomed to give way to electricity.

A perfected storage system might excel all others, but in the light of our present knowledge of electricity as a motive power, there are still many difficulties to be overcome. The overhead system has many disadvantages. The poles are unsightly; the wires break; the damp weather affects the power, and the gearing under the car is noisy. It has still to be proven, too, that they are run any cheaper than the cable, though the first cost of construction is admittedly much less.

The cities of New York, Chicago, Cleveland, St. Louis, Detroit, Washington and Philadelphia are increasing their cable system, but not their electrical ones. The Mayor of Detroit, in his recent message, declares that the electric road is not the coming motive-power for street cars in large cities, and this, too, after trials in that place. Broadway, New York, is being equipped with a cable plant; and all the roads in Washington will soon be run by cable.

But there are plenty of overhead wire electric roads running in the United States and doing as they were intended to. For suburban roads and small cities and towns where the overhead wires are less objectionable than in finely built streets of large cities, the electric road serves its purpose well enough. There is no reason to prevent their construction except the disfigurement of the street through which they pass. But as long as telephone, electric light and telegraph wires remain on high poles in the streets, the wires for the roads should also be permitted.

It is probable that in many places the cheaply built electric roads will pay in small cities where an expensive cable road will not, and this being the case, there should be no law to prevent their construction. If the people are willing to permit the wires and poles to be put up, and the capitalists are willing to build the roads, the law is a stupid one that prohibits it. There is no denying that there are many of these roads in operation, but whether paying or not is the business of the owners. If they accommodate the public and afford means for people getting out of the crowded districts of cities, they answer their purpose. In view of what is being done elsewhere, California will be the laughing-stock of the country if its Legislature permits a law on the statute-books prohibiting the construction of overhead electric railroads.

The Bear Valley Dam.

(Continued from page 65)

construction of great dams. Probably many engineers will answer in the negative; it is easy and safe to do so, and the person so answering has the cheap satisfaction of knowing he can always insist that he is right until some one builds a dam in which the strains are greater.

"While I would hesitate to recommend the construction of its counterpart under anything less than the pressing necessity under which this was built (when there was only so much money to be had, and it was a question of dam or no dam), yet I share the opinion of Mr. Brown, the designing engineer, in believing it to be safe under all normal conditions, and in case of an earthquake, somewhat safer than a straight gravity dam with a factor of two against overturning.

"In support of this opinion I submit the following facts:

"First—and above all—the dam is there, and has stood there for seven years under every conceivable natural strain except earthquake, and as yet a close inspection shows no sign of weakness in any part. The waste weir has been dammed up and the water has been raised to a depth of 44 feet above the top of the foundation. During storms, large waves have washed over the top and fallen 60 feet to the rocks below. Ice has been formed every winter to a thickness of over three feet, with a conformation of channel above the dam that would seem designed to make the ice pressure peculiarly trying; and lastly, 14 feet of snow has lain upon the ice at one time, and yet, as far as can be judged by appearance, the dam is in as good a condition as when it was first built.

"Second—The strains are all comprehensive,

THE PROPOSED NEW BEAR VALLEY DAM.

An engraving is also given herewith showing the proposed new Bear Valley dam, to be built about 100 yards below that we have described in order to enlarge the capacity of the original reservoir. The new dam is called a 120-foot one because it will raise the level of the water to 120 feet above the old datum plane, from which all the levels in the valley were taken.

onslave of the foundation below the natural surface of the ground, will be 133 feet.

The old dam is 60 feet high from the bed-rock, and was located on the best site available for a dam of that height, but above that level the sides of the canyon are not so steep at the site of the old dam as they are a little farther down stream. Hence, it so happens that the

Corporation Limited has been organized in London, and the necessary capital has been secured. The work of railroad construction is now going on actively in every direction. A number of mining engineers have been set at work examining mining properties in different parts of Peru, and this branch of the industry is being pushed. Petroleum-fields have been dis-

CROSS SECTION OF THE DAM.

ELEVATION AND GROUND PLAN OF THE BEAR VALLEY DAM.

and, by reason of the very 'unknown internal strains,' which the engineers of the Quaker Bridge dam feared to induce by throwing their dam into the curved form, every particular cubic foot of the mass, except one immediately on the convex face, will be found to be pressed on all six faces instead of two, a condition which will greatly add to its strength. If pressed equally on all six faces, such a cube would be in the condition of rocks under great mountains, and would practically be indestructible by any pressure however great."

In the picture of the lower face of the old dam, found on another page of this paper, the water will be seen flowing over a measuring weir close to where the lower man is standing. The crest of this weir is just at the level of the datum plane, and, as the new dam will be built lower down the canyon, about 150 feet from the old one, it will start 8 feet below the datum. This will make it 128 feet from bed-rock to the water-line. Above the water-line will be a wave parapet 3 feet thick and 5 feet high; therefore the total height of the dam, ex-

posed 120-foot dam can be built on a new site a little lower down and entirely independent of the old one, and still cost probably \$75,000 less than it would if an attempt were made to utilize the old dam by making it a part of the new one on the old site.

(To be Continued.)

Peruvian Mines.

Mr. W. R. Quimby of this city learns from Grace & Co. that the money has been raised to go on with the work in Peru. The Peruvian

covered and are being worked. Immigration has not yet begun, but preparations are going on in Europe to secure immigrants.

The wealth of Peru is proverbial, though of late years the country has not been very prosperous. The organization of this company to build railroads and develop mines will be a very important factor in the future of the country. There are many known mining properties in Peru that ought to pay handsomely if systematically worked by modern methods.

MAP OF BEAR VALLEY RESERVOIR, SHOWING GOVERNMENT SECTION LINES.

COAL AND IRON MINERS.—A dispatch from Pittsburg, Pa., says: The miners of the United States have just completed plans for the greatest industrial battle ever inaugurated in America. The conflict between the miners and mine-owners will take place on the first of May. The entire national organization of miners, comprising 150,000 men, will be directly involved in a demand for eight hours a day. At a convention of the American Federation of Labor, held in Detroit several weeks ago, it was decided to back the miners for eight hours a day next May. The utterances of the officers of the United Mine Workers on the subject leave no doubt that the miners will make a fight. An immense strike fund is being made ready for the miners, and when the latter go out they will have at their back for immediate use nearly \$1,000,000. This fund will be swelled from time to time at the rate of \$50,000 a week.

The new Metal of the Present, no longer "The Metal of the Future."

Aluminium,

RECENTLY PUBLISHED.

ALUMINIUM.—Its History, Occurrence, Properties, Metallurgy and Applications, including its Alloys. By Joseph W. Richards, M. A., A. C., Instructor in Metallurgy at the Lehigh University. Second edition, revised and greatly enlarged. Illustrated by 28 engravings and two diagrams. 511 pages. 8vo. Price \$5.00, by mail, free of postage to any address in the world.

CONTENTS.—CHAPTER I. History of Aluminium. II. Occurrence of Aluminium in Nature. III. Physical Properties of Aluminium. IV. Chemical Properties of Aluminium. V. Properties and Preparation of Aluminium Compounds. VI. Preparation of Aluminium Compounds for Reduction. VII. The Manufacture of Sodium. VIII. The Reduction of Aluminium Compounds from the Standpoint of Thermal Chemistry. IX. Reduction of Aluminium Compounds by means of Potassium or Sodium. X. Reduction of Aluminium Compounds by the Use of Electricity. XI. Reduction of Aluminium Compounds by other means than Sodium or Electricity. XII. Working in Aluminium. XIV. Alloys of Aluminium. XV. Aluminium-Copper Alloys. XVI. Aluminium-Iron Alloys. XVII. Analysis of Aluminium and Aluminium Alloys. Index.

A circular of 4 pages, 4to, showing the full Table of Contents of this thoroughly revised and recast treatise, showing the state of the industry up to 1890, and which has played an important part in the rapid development of this New Metal, will be sent free, and free of postage, to any one in any part of the world who will furnish us with his address.

Our new and revised Catalogue of Practical and Scientific Books, 87 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTH, ASSAYS AND ANALYSIS OF ORES, WATERS, ORE, SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everett**, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHES.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Books on Working Ores. The Explorers' and Assayers' Companion.
By GUIDO KUSTEL, M. E.
Roasting of Gold and Silver Ores (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.
This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed with full facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$5, coin, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.
By C. H. AARON.
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, \$3.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

THE GRAND BRONZE MEDAL was awarded by the 25th Industrial Exhibition of the Mechanics' Institute of this city on the Schenck Swinging Hose Reel. This reel is one of the most ingenious and perfect of recent inventions, and was made with a special view to simplicity of construction, service, durability, reliability, and perfect utilization of the water, and was made under an excellent record for itself, and has been placed in nearly all the large buildings lately erected in the West. The architects appreciate their superiority for inside fire protection, and have specified them in nearly every prominent building now being erected or in contemplation. No more perfect and reliable system of inside fire protection can be secured. W. T. Y. Schenck, 222 and 224 Market Street, San Francisco, is the inventor and manufacturer.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JAN. 20, 1891.

445,036—CIGARETTE MACHINE—H. Bohls, S. F.
 445,133—SEPARATOR—Cook & Parsons, S. F.
 444,976—FUEL-SAVING DEVICE—M. B. Dodge, S. F.
 445,052—GATE—J. W. Fisher, Palouse, Wash.
 445,110—GAS ENGINE—M. A. Graham, S. F.
 444,936—HARVESTER—G. W. Haines, Stockton, Cal.
 445,172—GRAIN SEPARATOR FOR HARVESTERS—L. H. Hill, Oakland, Cal.
 444,912—FAUCET—Meany & Bodie, Santa Barbara, Cal.
 444,932—ENVELOPE FASTENER—C. H. Voll, S. F.
 444,991—SIGNALLING APPARATUS—Morgan & Crowley, Los Angeles, Cal.

The following brief list by telexgraph for Jan. 27, will appear more complete on receipt of mail advices:

California—Henry Albert, Crescent City, assignor of two-thirds to T. R. Hayes, of Pasadena, can-labeling machine; George F. Andrews, Riverside, extensible tree prop; Louis E. Baker, San Francisco, type-writing machine; Stephen B. Black, Pasadena, agricultural implements for irrigation; Milton Debar, San Jose, invalid's bathing appliance; John E. Foster, Ferndale, harness; William S. Gage, San Francisco, coin wrapper; Henry O. Hooper, San Francisco, reverse movement attachment for type-writing machine; Edward M. Knight, San Francisco, filter; Joseph P. Maxey, assignor of one-half to H. A. Davis and S. Wilson, Oakland, such balance; William A. Todd, San Francisco, horse-hoe; William B. Wall, M. I. Jones, Tustin, and A. D. Bishop, Orange, fumigating trees and other plants; Ruel W. Whitney, San Francisco, type writing machine; Fred W. Wood and J. Fowor, Los Angeles, guard for street railway cars. Washington—Oleo F. Fehrsom, Tacoma, folding paper bath; Nathan A. Wheeler, Alpowa, calendar.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEPARATOR.—Austin Cook and Wm. L. Harvey, S. F., assignor of one-third to T. J. Parsons. No. 445,133. Dated Jan. 20, 1891. The invention relates to the general class of harvesting machines, and is especially adapted and intended for the separation of wild oats from cultivated oats or any other grain or material.

TRAVELING HARVESTER.—Geo. W. Haines, Stockton. No. 444,936. Dated Jan. 20, 1891. The patent covers a number of details of construction in traveling harvesters which improve and simplify the machines.

ENVELOPE FASTENER.—Chas. H. Voll, S. F., assignor of one-half to Oscar Fischer. No. 444,932. Dated Jan. 20, 1891. The object of this invention is to provide a simple and effective fastener for envelopes to be so adapted and applied that they can be by any possibility be opened without mutilation. The fastener consists of a strip of bendable metal one end of which is passed into the envelope and the other lies without it and crosses the point of the free fly, said inner end having a die integral therewith and said outer end having an integral eyelet on the same side as the die, said eyelet passing through the fly and underlying flaps of the envelope, and adapted to be flanged within the envelope by contact with the die.

GAS ENGINE.—Marcellus A. Graham, S. F. No. 445,110. Dated Jan. 20, 1891. This patent covers certain improvements in the details of construction of explosive or gas engines. To operate this engine the inventor employs an explosive gas or a vapor which is produced by mixing the proper proportion of atmospheric air with the vapor of naphtha, benzene, or other volatile hydrocarbon, and this vapor is drawn into the cylinder by a down-stroke of the piston, which acts as a pump, drawing the vapor from the source of supply through a suitable valve in the cylinder, and when the piston returns on its p-stroke the valve is closed and the vapor compressed in the upper part of the cylinder, so that when the piston commences its down-stroke again the upper part of the cylinder is charged with compressed explosive gas and this is then ignited by an electrical spark or igniter operating within the cylinder; and the explosion gives the piston such an impulse that it will complete the present stroke and the following one, in which it again acts as a pump to fill the cylinder with the explosive material, and the explosion taking place at the next stroke gives sufficient impulse to continue its motion. This regular power is properly stored and distributed by means of fly-wheels. The novel feature of the invention is the direct application of the governor stem or spindle to the main valve, admitting the vapor to the engine without the use of a supplemental valve of any kind, and by this means the inventor avoids considerable spaces and passages within which the vapor would remain between the source of supply and the engine.

FUEL-SAVING DEVICE.—Miles B. Dodge, S. F. No. 444,976. Dated Jan. 20, 1891. This is an improved apparatus to be used in connection with train engines and boiler furnaces for the purpose of economizing the fuel used under the boiler. The object of the invention is to introduce air into the furnace for the purpose of combustion at a high temperature and to utilize the exhaust steam of the engine and that waste heat from the boiler furnace accessibly for the purpose of raising the temperature of the air, at the same time employing the air-last which is thus being heated as a means for conserving the steam which exhausts from the engine.

TRAIN-FARE PUNCH.—Willis D. Eitel, San Jose. No. 444,576. Dated Jan. 13, 1891. This invention relates to a device which is called a train-fare punch,

which is adapted for the use of conductors for the purpose of indicating the amount of money received for tickets sold on the train. It consists of a casing containing a train of gearing, reciprocating racks by which the gears and connecting indicators are wound, said racks being actuated by the ticket, with gauges to limit the movement, together with certain details of construction.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

The new ten-stamp mill on the Texee & Georgio mine, at Old Diggins, Shasta Co., will soon be ready for work. There is at the mill a rope tramway from the ore dump.

The American Belle M. Co. intend putting up a copper plant at Durango, Mexico, for treating the ores from that mine.

For Sale for Want of Use.

One horizontal reversible engine, 8x12; one hoisting drum, 30x30, with V friction and excentric; one gear, 4 feet x 4 inches face; one jack 4-inch head pump; one steel boiler, 36 inches x 12 feet; stack with fronts, wood grate bars; safety rods, pump and heater, etc.; being hoisting works complete. Has been little used. The same can be seen at Glencoe, Calaveras Co., Cal. For further particulars, apply to J. H. Gillispy, 1914 Stockton St., San Francisco.

A GOLD-MILL SUPERINTENDENT

Of long experience, assayer and practical chemist, desires an engagement, particularly in a mill where gold and amalgam is wasted. The best of references given. Address E. W., 1278 Tenth Avenue, East Oakland.

SITUATION WANTED.

A German in charge of a pulp reduction works in Mexico for 10 years wishes to change his position on account of the bad health of his wife, and take charge of a mine and mill in a mild, healthy climate. Address letters M. K., No. 100, this office.

CHEMIST.

Young man who is a competent mineralogist, assayer and analytical chemist is open to an engagement; best references; can furnish small capital. Address CHEMIST, this office.

12 Cortlandt St., New York.

Testing and Working Silver Ores

A VALUABLE BOOK

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krochik's process, etc. Under "Pulverizing Machines" are described the arrastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tallies, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by Dewey & Co., Publishers, 220 Market St.

Malthine M'f'g Co.

Crushing Fine Material.

The accompanying engraving shows a Gates ore-breaker with revolving screen and return elevator. This plant is designed to break the material very fine and to size it so it will all pass a certain mesh screen. With this plant it is practicable to break so that everything will pass a three-eighths inch screen. The great advantage of having product thus prepared for stamp-mills, rolls or other reducing machinery, is at once apparent. It is also perfectly adapted to preparing certain ores for roasting and other processes requiring an even product; for finishing material for concrete, top dressing, roofing, terra cotta, etc.

The practice in breaking material fine has heretofore been to reduce the size of the discharge opening of the breaker to the smallest opening possible without allowing the crushing surfaces to touch, then feeding the breaker only such quantities of material as will not use enough of the breaking surfaces to require power enough to stall the machine or overbeat the journals. It is well known to those familiar with stone and ore breaking that the power required and strain on the machine increase in an inverse ratio as the discharge opening is decreased. In this plant advantage has been taken of this fact, so as to produce a maximum amount of fine material with a minimum amount of power, wear, etc.

The discharge opening is large enough so that the machine works easily when the entire crushing surfaces are acting on the material. The material passes into the screen, which has perforations to take out the size required, the residue or rejections, as they are named, passing out at the end of the screen and being rapidly returned by the elevator into one of the openings of the breaker.

The new material is fed into the two remaining openings, and an occasional piece into the opening with the rejections. The amount of

rejections returning being much greater than the product which goes through the perforations in the screen, the side of the breaker into which they return is kept full, and thus they are rebroken by contact with themselves as well as with the breaking surfaces in passing through the machine again, and in time become

small enough to pass the perforations. The feeding of the new material is soon regulated to the amount of rejections returning, and the breaker is then doing all the work possible.

When desirable to stop work, the rejections will be broken down to small quantity in a few moments after feeding is discontinued. The

GATES ORE-BREAKER FOR FINE MATERIAL.

gate is then put in the upper spout and the remaining material caught in the spout. This leaves the machine free to be started, and when under full headway the gate is drawn, letting the material therein into the breaker, and the feeding commences as before.

It must be understood that the above described plant is especially recommended where a very small or even product is desired. If not smaller than $\frac{3}{8}$ inch and some spalls are not objectionable, the screen and elevator are not needed with this breaker up to and including Size 3, as the product from the breaker will be finer and more even than that obtained from any other machine. The Pelton Water Wheel Co. are agents for the Gates crushers for the Pacific Coast.

The Cruiser Baltimore.

The cruiser Baltimore is one of the class of unarmored cruisers of the "new navy" of the United States. She is 335 feet long, 48 feet 6 inches beam, 19 feet 6 inches draft and 4400 tons displacement. The propelling power of the vessel consists of two horizontal, direct-acting, triple-expansion screw engines, and boilers capable of developing 10,750 horse power when making 110 revolutions of the screws per minute. The two high-pressure cylinders are each 42 inches diameter, intermediates 60 inches, and the two low-pressure 94 inches, having a piston stroke of 42 inches. The main steam valves are double-ported slides working on hard cast-iron seats.

The screw propellers are made of manganese bronze, having three blades each 14 feet 6 inches in diameter, set to a mean pitch of 20 feet with a variable pitch of 18 feet 6 inches and 21 feet 6 inches. The starboard propeller is right-handed and the other left-handed. She has four French breech-loading guns, six six-inch breech-loading rifled guns, eight six-pounder rapid-firing guns, and two gatlings. She is also fitted with five torpedo tubes.

The Baltimore is one of the series of ships built on the English drawings, and was built by Messrs. Cramp & Sons of Philadelphia. The accompanying engraving, made direct from a photograph, shows the general appearance of the cruiser.

A LARGE body of water was suddenly liberated in a coal mine at Janesville, Pa., on Wednesday, and 18 men were drowned. The working is situated immediately under the old workings known as No. 8, worked out some five years ago and filled with water. The cause of the disaster was due to the drilling of a hole through a pillar, which liberated an immense body of water confined in the old workings, flooding the new workings and drowning all the men in that portion of the mine.

The manager of the "National Mineral Mining Co." has been convicted by a police court jury of setting up and managing a lottery, which masquerades under the title of a mining company. This was a test case. Chief Crowley says that if the scheme is discontinued no other arrests will be made, but if the managers insist on resuming business, he will cause the arrest of the whole crowd.

A COMPANY called the California is to work the Pittsburg mine, near the head of Squirrel Creek, Nevada Co. Work will be commenced shortly on the prospect.

THE UNARMORED CRUISER BALTIMORE.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Gravel in British Columbia.

The Middle Creek Gold Mines.

EDITORS PRESS:—The Middle Creek Gold Mining Co. was incorporated in Jan. 1890. Its property is situated on the first north fork of the Stickeen river in British Columbia, and consists of 1440 acres of land that is mostly gravel, in trenches from 50 to 150 feet high, in which can be found gold in every place where it has been prospected. The company has an abundant water supply at a nominal cost with fall of upward of 300 feet, and a dump below without limit. The climate is cold in winter, but hydraulicking can be carried on from April till October, the long days of 20 hours of daylight in July being especially favorable. There can be found near by plenty of fish and game. There is no debris question there to interfere with operations, and a property so situated here with regard to dump, fall, water supply, body of gravel and privilege of working would be of immense value.

The directors of the company are: Chas. P. Harris, Pres.; Cesar Bertheau, Vice-Pres.; Harry D. Hawk, Sec.; Geo. W. Peterson, Supt.; Rudolph Jordan, Martin Bacon and Chas. J. Chapman.

The following is the report of Acting Superintendent George W. Peterson to the directors of the Middle Creek Gold Mining Company:

Gentlemen:—A partial report dated Oct. 27, 1890, was submitted to you by Mark Shepard, superintendent, which omitted some items of detail which might be of interest to your stockholders and of some importance in determining future action.

Mr. Shepard was taken sick on the 5th of September and left the property in my charge; hence I beg leave to submit the following to you as a report supplemental to that made by Mr. Shepard already referred to:

We left here on the 1st of April, 1890, and arrived at Fort Wrangle on the 25th. We were delayed here awaiting transportation until May 22d, on which day we started by the Stickeen river on the steamer Alaskan, expecting to arrive at head of navigation in five days, instead of which we were 15 days, owing to low stage of water, thereby losing ten days of valuable time.

At Telegraph Station we were also delayed several days awaiting arrival of pack-train, during which time we built a trail nearly 12 miles so as to transport our supplies. On the arrival of such pack-train from Deese lake, and the completion of the trail, our supplies were put on the company's ground as rapidly as possible. It being June 11th before we arrived at our destination, we found the country had been in such condition that we could have worked at least six weeks before had we been on the ground, as vegetation was rank and flowers in full bloom.

We at once surveyed a ditch, built a camp, and began active work, as shown by report of Superintendent Shepard.

After expending several days in surveying our ditch, all our work was obliterated by a forest fire, which destroyed all the marks and pegs, also making a loss of time in resurveying. After the above delay aggregating a loss of 33 days, all matters connected with the working of the claim ran as smoothly as we could wish, with exception of our ditch break, of which hereafter.

The digging of our ditch and fitting the pipe and other attendant necessary preparations, fully occupied all our time until August 24th, when we first let the water through the ditch and began washing. After piping five days (days and nights) a break occurred in the hill, carrying away 150 feet of our ditch, including our penstock at the pipe head, which necessitated a change of ditch penstock, pipe line and general workings, making a delay of 14 days.

The landslide was caused by percolation from the ditch which extended downward, softening the whole hillside at that point for hundreds of feet. On the beginning again of our washing, we found many howlers in the gravel too heavy and too large to handle without powder or derrick, and as we had neither, we found ourselves at great disadvantage.

We found also that if we continued washing for a few days longer, no cleanup could be made on account of howlers and inability to get to bedrock in so short a time, hence I decided to spend the few remaining days in preparation for another year, and in prospecting our ground that I might be able to state the probabilities for future guidance from personal experience. At that time we were short-handed and found it difficult to get men, as the distance from Fort Wrangle, 200 miles, was too great. We had also to prepare winter quarters for the men who will winter on the company's property. On the date of my leaving the claim, Oct. 10th, the property was in charge of three men who had ample provisions on hand to last until next June, and who will begin working as early as possible, at least 40 days before your superintendent can get there from here.

As acting superintendent and a stockholder, having quite an interest at stake, I prospected the company's property and examined into the water rights and supply thoroughly and conscientiously, and it gives me satisfaction to be

able to report the results. I found our title to be undisputed and beyond question, that such water is at least 2000 inches at lowest stage and continues the entire season. I found plenty of timber on our ground for all purposes. On prospecting I found gold in every pan from the top of our cuts to the bedrock, in some instances such prospects being exceedingly favorable, and all being most satisfactory and promising to hydraulic miners. In the spring coming we will begin working in a hillside where we will soon have a face or bank of gravel at least 100 feet high, which height increases as we advance.

The gravel at this place prospects exceedingly well, and with a run of a season there is not the slightest doubt of the company paying a dividend.

The amount of gravel in sight on the claim cannot be washed away in many (say 50) years in seasons of six months each, by any known process with our water supply. In regard to the past season, taking into consideration the loss of time as before mentioned, the fire, the distance and all inconveniences attending the equipping and opening of a mine situated in an unopened country 2000 miles or more away, we could hardly in reason have expected a dividend the first year, or that the property could have been put on a paying basis. Yet I am confident that had I been able to get a run of 40 days, I could have cleaned up more than enough to have returned to the company all its expenditures. After an experience of several months on the premises, I feel that the Middle Creek G. M. Co. can be congratulated on having a very valuable mining property.

Oro Blanco District, Arizona.

EDITORS PRESS:—I very seldom see anything in the papers about this portion of Arizona, which is, however, certainly coming to the front as a hulk-producing section.

For the last seven or eight years this portion of Pima county has had a black eye given to it by a number of old "chromes" who do their prospecting in their cabins and denounce all properties outside of their own locations, which generally prove themselves of a wild-cat character when submitted to a proper examination.

Up to within the last two years a very small amount of prospecting has been done, and to those who have ventured to-day belongs the honor of bringing Oro Blanco district at least to the front. The Yellow Jacket mine, which has been idle for the last 12 years, and which was sold some time ago to a New York party, has now in full operation a new 20-stamp Boss process mill, which is kept running day and night.

The main shaft is now down 250 feet and crosscuts from wall to wall show a ledge of from 40 to 60 feet, nearly all of which is pay ore for the new mill. The drifts show up finer ore in all parts of the mine than was ever expected by the former owners.

Are there any more claims or mines on this lode or mineral-bearing belt? Well, I should remark! This mineral belt is traceable along the entire for seven or eight miles, and in a number of different locations can be found immense deposits of higher-grade ores than are mined by the Yellow Jacket Co.

Space will not permit me to describe the various claims on this lode outside of the Yellow Jacket mine, but I shall in my next letter describe to your readers mineral-bearing properties on this lode that will, no doubt, attract the attention of capitalists looking daily for a good chance to successfully invest their money.

There are now pending several mining sales on this lode, which, if consummated, will prove to the "Chronicle Kicker" of Oro Blanco mining district that he better be placed in a crematory alive than to try to again denounce the only resource of this country from which comes his fripples and carne seco. I. C. U.

Yellow Jacket Camp Oro Blanco, Pima Co., Arizona

MINING IN THE FUTURE.—When there occur a few failures in mining operations, the faint-hearted at once commence to decry the industry and to predict its final abandonment in the section in which they live. It has been so in Nevada county several times. But only a few years elapse before a revival sets in, and the former croakers become more enthusiastic than the ones who succeeded in opening good properties. The principal industry in mining counties has been, is now, and will continue to be, mining for a century to come. While agriculture and horticulture will be carried on to some extent, and profitably, too, the main reliance will be mining. There are possibilities not dreamed of yet all over the foothill counties. Mining makes a market for the farmers and gives business to the towns. It produces a circulating medium that the world needs and must have. It makes a section of the State prosperous that would otherwise be very thinly populated. It gives patronage to iron-workers, transportation companies, mechanics, and in fact to all lines of business. Hence it should be encouraged by all citizens. Officials, high and low, should favor it, and legislative bodies should listen to its demands. A district should be set apart so mining can have a Congressman to represent it in the National Legislature. We hope to see the present Legislature so apportion the State that this desideratum may be reached.

—Nevada Herald.

Mines and Mineral Deposits on the "Eastern Slope."

Baece Oree, Auriferous Gravels, Etc.

EDITORS PRESS:—Along the easterly slope of the Sierra Nevada, extending from the headwaters of Walker river on the north to the headwaters of Owens river on the south, a distance of 60 miles, valuable mineral deposits occur almost continuously. These deposits are of various kinds, including small gold-bearing veins and mixed gold and silver-bearing lodes, some of them of great magnitude, besides a large area of placer ground. This metalliferous belt was run over and hastily prospected soon after the discovery of the Comstock lode, numerous mining claims having at that time been taken up along it. Slight examination disclosing that the ores here did not belong to the Comstock school, the type the prospectors were then in quest of, a majority of the claims taken up were soon after abandoned, the most of them before anything had been done upon them.

On a few of the more promising, however, exploratory work was commenced, this work on several having afterward been prosecuted to definite results. Among these,

The Dunderberg Mine.

Located in the Jordan or Castle Peak District, stands conspicuous, the ledge here having been opened up by a tunnel nearly 600 feet in length. This ledge, which traverses the mountain-side in a northerly and southerly direction, can be traced by its outcrop for a distance of several miles. The strength of this lode and the regularity with which it holds to its course, together with the character of its contents and of the enclosing formations, establish that it occupies a true fissure. It occurs between walls of slate and porphyry, standing from 60 to 100 feet apart, the gangue matter consisting mainly of quartz, quartzite, talcose slate, and porphyry.

The tunnel, run in from the east, intersects the footwall of the lode at a depth of 355 feet below the outcroppings, the lode at this point pitching to the west at an angle of about 75 degrees. From the tunnel a drift has been extended north 200 feet and another south 100 feet. These drifts, carried in along the footwall, disclose here a streak of highly sulphurated quartz from three to ten feet in thickness.

From the report of Mr. Henry Griswold, an experienced and competent miner, who had charge of this property for some time, the following facts in regard to it are derived: In the north drift mentioned, an ore chimney nearly 100 feet in length has been developed. The ore extracted from this chimney daily, for a period of six months, showed an average value in gold and silver of \$55.86 per ton of 2000 pounds. Samples of the highly sulphurated ore taken from 40 different points above the present levels yielded an average of \$64.28 gold and \$53.42 silver per ton, the quantity of this class of ore developed in the mine being estimated at 12,900 tons, exclusive of much lower-grade milling ore.

The reason assigned for discontinuing operations here is the want at that time of a process adapted to the successful treatment of this class of ore, the most of which, though rich in the precious metals, is extremely base, these metals being combined with arsenic, iron, sulphur, antimony, etc. With the improved metallurgical methods since introduced, it is believed this ore could be successfully and profitably worked, it being under this conviction that parties having ample means are about taking hold of this mine with a view to developing it more fully and working the ore on a large scale, for both which there exist here the best facilities. The ledge can be exploited to great depths by means of adits driven in from the easterly face of the mountain, wood of the best quality, whether for lumber or fuel, also water, being abundant on the ground. This entire slope of the Sierra is in fact well timbered, streams of water, large and small, coursing down its side at short intervals. In this respect no mining district in the State is better situated.

Nor is the Dunderberg the only promising mine along this belt. There are others equally promising and perhaps equally valuable, this property having been here more fully described, simply because more and better work has been done upon it than on any other. Whether or not there is enough in this region to justify many and large investments of capital, certain it is there is enough to invite careful examination on the part of those contemplating ventures in that direction.

The Placer Ground

Mentioned consists mainly of heavy deposits of auriferous gravel, adapted to be worked only by the hydraulic process, most of the shallow diggings, ravines and gulches having been worked out by hand-sluing and rocker-washing long ago. The conditions for hydraulic gravel-washing are here of the best kind, both gravel and water being plentiful, the latter capable of being applied under any desired head, with everywhere ample fall for running off tailings. A great deal of this placer ground has been taken up and is now held in large tracts by companies, some of which contemplate outfitting their claims with plant and inaugurating here large hydraulic operations the coming spring, and it is not improbable that the lower slopes and foothills of the Sierra at this point will eventually become the sites of numerous other enterprises of this kind.

Jan. 25, 1891.

HENRY DEGROOT.

Gravel Mining in Plumas.

An Undeveloped Industry.

A correspondent of the *Plumas National* writes as follows:

Gravel mining in this county is comparatively an undeveloped industry. It is true that gravel has been washed since the earliest days, but when the vast group of ancient river beds, a majority of which are still undisturbed, is considered, it is at once apparent that this special branch of mining is as yet scarce begun.

Gravel mining in the early days was confined exclusively to shallow banks, river here, and the still lighter deposits in the creeks and gulches, composed the bulk of mining operations in those days. The facilities and present modes were unknown. But as time progressed and the shallow "diggings" became exhausted, the necessity of opening deeper mines presented itself. Appliances of a suitable character were invented, and the hydraulic pipes were brought into use. This mode of mining, however, could be applied only on channels that were situated sufficiently low to allow of water being brought in ditches higher up, thus affording fall, or pressure, to the water conveyed through pipes from the ditches and reservoirs into the mine. Channels thus favorably situated were not over-plentiful, yet the industry developed into great prominence and contributed largely to the gold yield for many years. It is not, however, of this kind of mining that I would speak in this article, but of the existing untouched and undeveloped river channels that lie higher up and beyond the availability of working by the hydraulic process. And even were they less unfavorably situated, a majority of them could not be profitably mined by this mode, owing to the lava caps that cover them and the heavy deposits of pipeclay that overlie the deposits of gold-bearing gravel. This gravel being the heavier material, underlies all other deposits and is contained entirely within and directly on the bottom of the channel.

The age, or possibly the different ages, in which these channels were formed, is conjecture, and in the writer's opinion, it is needless for practical purposes to spend time in computing or theorizing on the ages or epochs to which they belong. This is for the scientist, whose occupation is so confined. For the practical miner, or the capitalist, who may invest a portion of his wealth in opening these channels, it is sufficient to know that they exist, and when developed, the investment will yield a hundred fold. The only practicable way to open these rock-rimmed mines is by running tunnels through the rims, at a sufficient depth to tap the bottom of the channel, and then get at the gravel deposits. This once accomplished, the rest is easy. Through this mode the upper strata of clay and lava, which are barren of gold, are left unmolested, while the gravel is "breasted" out.

It occurs to me at this point that the immense bodies of clay may contain vast quantities of that rare metal, aluminum. Should it be proven that this clay contains this mineral—and we read that it is found in all clays—what an immense industry would spring up. The cost of obtaining the clay would be very slight. Investigation might prove of great value. Aside from the clay deposits, the underlying gravel would yield most satisfactory returns, while the two in conjunction would form the greatest and richest mine of which man could possibly conceive. As yet, the possibility of developing such a mine is uninvestigated. Capital and scientific research would, in all probability, discover just the kind of mine mentioned. This clay is in a perfectly pure state, and in quantities unlimited. In this particular section, water for motive-power is not only plentiful but available.

The old channel system is an extensive one. Within a radius of half a dozen miles twice as many clearly defined channels are found. A few are intact for many miles in extent; others are more or less broken from convulsions and erosions. Those lying low have been worked extensively by hydraulicking and have yielded vast amounts of gold. The larger and more extensive channels, which are generally situated on the higher elevations, ridges and divides, seem the more favored locations, and being higher than the surrounding country, and with precipitous sides, afford excellent sites for tunnels. It seems to the observing mind strange that with all the natural advantages at hand that man could reasonably wish, these river-beds have not long since been explored, but such is the case, and no one, not even the fossilized miner with whom this country is hounded, can say there are no mines in these channels, for as yet, with few exceptions, nature's constructions are unmarred by man. A few attempts have been made by so-called large companies to open mines in this section, but with disastrous result. These companies were formed in the East, of Eastern capitalists, headed by adventurers with far more cheek than practical knowledge. A corps of officers was also sent from the East, whose combined knowledge of mines, when elms down, would not equal that of a Chinaman, and the number of officers sometimes outnumbered the working men. Thus the money was squandered, while development work was a secondary consideration. It requires only a limited number of men to run a tunnel—six at the most when three shifts are run—with a practical miner as foreman. If the money that has been thrown away by adventurous persons and that paid to high-salaried officers had been

judiciously spent, many paying mines would be in operation here to-day. The advent of such a company in a mining section is generally hailed with delight by the people, because times are made better, but it were far better for the section if such companies had stayed away, for when the reaction comes, as it invariably does, times are left in far worse condition than before; besides, the country gets what is technically called a "black eye," a setback from which it takes a long time to recover.

Quite a number of enterprising companies are at present engaged in running tunnels for drift mines, and with very flattering prospects ahead. By the 1st of March next this section will be awakened to the fact that such mines truly exist here, and the awakening will be the beginning of lively times, which will be permanent. A great deal of attention is just now directed to this section. The surface diggings have yielded many millions. The sources from which sprang this yield is now being considered, hunted for and found.

Butte's Mineral Record.

A most complete resume of mining operations in Butte during the year past appears in the *Miner*. The appended summary gives a clear idea of the magnitude of the industry in the great camp:

Value of the Total Output.

The following figures show the total value of the copper, silver and gold produced from the mines of Butte alone during the year:

Anaconda.....	\$15,940,000
Boston and Montana.....	3,235,000
Butte and Boston.....	1,584,000
Allice.....	1,100,000
Parrot.....	1,470,000
Colorado and Montana.....	1,250,000
Butte Reduction.....	1,600,000
Bannister.....	200,000
Moulton, Lexington and Blue Bird bullion shipped by express.....	1,600,000
Total.....	\$27,279,000

Dividends Paid.

From this output of \$27,279,000, dividends have been paid by the several companies aggregating \$6,176,000, divided as follows:

Anaconda.....	\$3,840,000
Boston and Montana.....	812,500
Butte and Boston.....	300,000
Parrot.....	400,000
Butte Reduction.....	400,000
Colorado and Montana.....	400,000
Allice.....	100,000
Moulton.....	50,000
Bannister.....	24,000
Blue Bird (three months' run).....	50,000
Total.....	\$6,176,000

Number of Men Employed.

The number of men employed and the companies employing them is accurately given in this statement:

Anaconda.....	1,500
Boston and Montana.....	500
Butte and Boston.....	350
Parrot.....	200
Blue Bird.....	300
Allice.....	300
Colorado and Montana.....	325
Lexington.....	250
Butte Reduction Works.....	150
Moulton.....	100
Glossary.....	50
Bannister.....	20
Leggett.....	20
Germania.....	20
Goldsmith.....	20
Minnie Healey.....	10
Volunteer.....	10
Valley.....	10
Mary Ann.....	10
Clear City.....	12
Homestead.....	15
Shonbar.....	10
Betsy Dahl.....	8
Others combined.....	350
Total.....	4,757

Underground Workers at Butte.

The Butte (Montana) *Inter-Mountain* says: Few people have an adequate idea of the army of men daily engaged in the mines of Butte. In order to furnish what may serve as a basis from which to figure in this important computation, the following figures are given. Only a few of the more important mines are named, but they will suffice to show in a measure the multitude of the men who are contributing to the upbuilding of Butte:

MINES.	NO. MEN.	WIFE.	NO. MEN.
Anaconda.....	400	Moulton.....	12
St. Lawrence.....	250	Kiesing Star.....	30
Mountain View.....	50	Glenary.....	60
Mountain Con.....	400	North Star.....	12
East Colusa.....	70	Blue Wing.....	40
West Colusa.....	40	Lexington.....	90
Lewisohn new shaft.....	40	Leasing Walkerville.....	150
Cambetta.....	40	Gagdon.....	100
Silver Bow.....	120	Original.....	24
Harris & Lloyd.....	100	Opbir.....	15
Ramsdell Parrot.....	50	Shonbar.....	20
Shakespeare Parrot.....	0	Vulcan.....	60
Brickerlease.....	50	May Ann.....	14
Parrot new shaft.....	120	Star West.....	12
Clear City.....	12	Nettie.....	130
High Ore.....	15	Leasers, Burlington.....	70
Modoc.....	15	The Sullivan in Park.....	10
Jim.....	4	you.....	10
Green Mountain.....	30	Clinton.....	20
East Gray Rock.....	70	Mulville's lease in Colum.....	10
West Gray Rock.....	12	his Garden.....	9
Belle of Butte.....	40	Tom Haney.....	20
Black Rock.....	35	Burlington.....	10
Daniel Quip.....	15	Blue Bird.....	90
Moore.....	50	Lille Darling.....	6
Magna Charta.....	100	Champion and vicinity.....	70
Allice.....	150		

THE NUMBER OF TELEPHONES now under rental by the Bell Telephone Co. is 478,725, an increase of 38,885 over the same time last year.

A State Weather Service.

We believe no subject now before the Legislature will command itself more forcibly to the agricultural producers of this State than the establishment of a State Weather Service upon the plan embodied in a bill introduced in the Assembly by Mr. Robertson of Siskiyou. We have really made great progress during recent years in an understanding of our peculiar climates, thanks to the Signal Service officers and other earnest students of local meteorology, and it is now feasible to greatly extend such observations and render their results more available at an exceedingly low cost. We believe there is no proposition now before the Legislature by which so much can be realized at so small cost.

The proposition is to organize and equip a State Weather Service, and, as might be expected, Serg't Barwick, of Sacramento, is leading in the effort and ready to assume its extra responsibilities and duties without cost to the State. Secretary Smith, of the State Board of Agriculture, is ready to assume the direction of the service, in addition to duties already covered by his salary. The result is, that the service can be had for the pay of a clerk and the cost of necessary stationery—each of these items being placed at \$100 per month—and the cost of instruments, which are furnished to voluntary observers, taking from them personal bonds therefor. Thus the service can be realized for very small expenditure of public money, and is in fact what is called, a "Voluntary Weather Service." Such a service is rendered practicable, because the United States Signal Service co-operates with the State organizations and furnishes blanks, postage, instruction-books, etc., free of cost to the State.

California is late in organizing such a service, and yet we know that Lieut. Finley is right when he says: "No other State in the Union is more in need of a formal organization for meteorological work than is California. She has immense interests to be benefited by the work of such a service." New York began in April, 1889, and has published a report of 122 pages deeply interesting and important, and the whole cost of the service which is thus epitomized was but \$1737.34. Other States that have established local Weather Bureaus are Alabama, Arkansas, Colorado, Dakota, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New Jersey, Nevada, North Carolina, Ohio, Oregon, Pennsylvania, South Carolina, Tennessee and Texas. By the bill of Mr. Robertson it is now proposed to extend the roster by adding California. The bill provides that the service shall be supervised by the Director of the State Agricultural Society. The central station to be at Sacramento, with a chief, an assistant and a sub-director, the first to be the secretary of the State Agricultural Society, the second an officer of the National service who may be detailed for that purpose, and the third to be the Superintendent of Public Instruction.

There are to be three volunteer stations in each county, and all teachers in public schools, if required by the county superintendents, who are to be county sub-directors, are to make and note daily observations and forward them. A weekly weather and crop bulletin is to be issued from the State printing office, from April to October, and each month a weather and crop review published, and annually the chief director is to publish, with the report of the State Agricultural Society, a review of the year's work.

This is in outline the proposition which is now before our Legislature, and one the enactment of which we believe our agriculturists should insist upon. Last summer, Serg't Barwick began a voluntary service, securing his local observers in part through invitation published in the *RURAL* and other journals. He succeeded so well that he received special commendation from Gen. Greely, Chief of the U. S. Signal Service, who has instructed Serg't Barwick to make requisition for as much extra supplies, such as blank forms, franked envelopes, etc., as may be needed for an increase in the weekly crop service for the coming season. Serg't Barwick is now waiting before making such requisition for supplies until he knows the outcome of the bill, now before our Legislature, for if this bill becomes a law, he will require much greater supplies than he could possibly use otherwise.

We have, then, the opportunity to enjoy more than ever before the benefits of the U. S. Service; we have a chance to produce a crop of trained weather observers and meteorological students; to bring the subject right into the schools, where it belongs; to inform ourselves upon crop prospects and to be warned of threatening weather conditions; to make better known throughout the world our glorious climate—all for a sum which is merely nominal in comparison with the benefits to be derived.

We can hardly see how a legislator can have a doubt upon the wisdom of the proposed legislation, and we expect to see it speedily realized.

THE HEADQUARTERS of the Mountain Division and of the Utah division of the Union Pacific will move to Ogden from Salt Lake City this month, as General Superintendent Bancroft feels it for the road's best interest for the headquarters of the road to be located where two of its divisions—the Central Pacific and Rio Grande—have a common terminal.

Magnesia Coverings.

The great need of economy in manufacture of every kind and in the employment of steam-power for whatever purpose has been one of the problems which engineers have studied ever since the introduction of steam as a motive-power. One of the greatest sources of leakage and loss of heat, and hence of waste, is evaporation. Wherever a steam pipe is exposed to the atmosphere, it at once gives up its heat, and wherever cool surfaces are exposed they absorb heat. It has, therefore, been one of the problems of the age to invent a material which should be a perfect non-conductor and which should withstand excessive heat or extreme cold without becoming itself a transmitter of either, or yet suffering under one condition or the other.

As may be supposed, many such substances have been tried with more or less success. One of the most prominent is the magnesia sectional covering which is recommended by the Bureau of Steam Engineering in the Navy Department, Prof. John M. Ordway in his report to the Boston Manufacturers' Mutual Fire Insurance Company, and thousands of other steam-users in this country. This light, cleanly and reliable material is the result of an intimate combination of asbestos, carbonate of magnesia and fiber. It is made in regular lengths for pipes and in sectional blocks for boiler covering, while specially molded pieces are prepared for all standard sizes of elbows, pipe joints, valve-boxes and other machine parts. It is readily attached to any steam pipe, being for this purpose made in lengths of about three feet each, canvas covered and supplied with two iron straps or bands for firmly holding the sections together. For boilers the blocks are made in sizes 3x18 and 6x36 inches, varying in thickness from 1 to 1½ inches. The blocks can be fitted at any time, whether the boiler is hot or cold, and when required the covering is supplied in a plastic condition, so that it can be put on with a trowel. The special advantages of magnesia sectional covering may be summed up as follows: Ease of application or removal, inflexibility, absolutely non-conducting properties, and so a matchless covering for a steam boiler or a refrigerator; durability—it will last 20 years without being touched or becoming impaired—and its power of absorption, locating immediately any leak in the pipe or other covered vessel. The sole agents of the magnesia coverings for the Pacific Coast are C. B. Johnson & Co. of 59 Clay street, San Francisco. A large stock of the material is always kept on hand. There are hundreds of places in the city where the coverings are in use, which testify better than any number of written testimonials could do to the services rendered and to the great economy resulting from their use.

Rock-Breakers and Crushers for Australia.

Parke & Lacy Company of this city shipped on the steamer "Monowal," which sailed Thursday for Australia, four No. 6 Gates crushers, each having a capacity of 1440 tons per day, or an aggregate capacity of 5760 tons per day. These breakers are made by the Gates Iron Works of Chicago, for which Parke & Lacy Co. is agent, and they are for use at the quarries of the New South Wales Government. The same steamer also took four smaller breakers of the same make having a total capacity of 2000 tons per day. These are to be used by the Broken Hill Proprietary Co., which operates probably the largest lead-silver mine or mine in the world to-day.

In addition to the above, Parke & Lacy Co. shipped three Dodge rock-breakers for other mining enterprises, having an aggregate capacity of 900 tons per day, making in all a shipment of 11 rock-breakers capable of crushing 8660 tons and weighing, ready for shipment, 135 tons.

These orders have been the result of many years of hard work on the part of Parke & Lacy Co., being virtually a question of superiority of American manufacture over those of foreign countries, and it is certainly gratifying to all to note the triumph of the former. Parke & Lacy Co. received a cable last week from their branch house in Sydney ordering four more No. 6 Gates crushers, presumably for the Broken Hill Proprietary Co. These will be shipped by sailing vessel from New York early in February.

LOWER CALIFORNIA MINING.—The San Domingo mine, owned by Americans, is situated only a short distance back in the interior and at present is furnishing work for 30 men, mostly Mexicans. In the last month, Capt. O'Connell has brought over to Cedre Island two outfits of bullion amounting to \$9600. At San Domingo the mining company is running at present only a five-stamp mill, although a ten-stamp mill is about ready for use on the ground. Forty miles back in the interior are the San Miguel arcetes, owned also by Americans, whose headquarters are in New York.—*San Diego Sun*.

THE SMELTERS of Colorado have formed a combine against the ore-producers of that State, and have them at their mercy. This has been done in retaliation for the enforcement of the lead tariff law which prohibits the importation of Mexican ore. The ore-producers are now considering the advisability of erecting smelters of their own.

Forms of Atmospheric Disturbance.

NUMBER 1.

EDITORS PRESS:—In view of the many inquiries received at this office relative to the use and significance of technical meteorological terms, and for information as to the character of the various forms of atmospheric disturbances recognized by the science of meteorology, it has been deemed advisable to prepare for publication, through the PRESS, a series of circulars or bulletins which will briefly but yet comprehensively furnish the desired data. It is believed that this plan will serve to instruct the public on an important subject and assist in making the daily weather forecast of more practical value. The first circular will treat of

The Cyclone.

About 50 years ago Piddington of Calcutta, East India, first applied the term cyclone to all circular storms of whatever area. The earliest published account of storms where the curving of the wind is recognized was by Captain Longford in 1693, in a paper on the West India hurricanes, which he called "whirlwinds." The term cyclone comes from the Greek cyclos, which signifies, among other things, the coil of a snake. Its application to the most important of all meteorological disturbances is not intended to affirm that the area described by the storm is a true circle, but rather expressing sufficiently the tendency of the air to a circular motion. The word is now accepted by the leading meteorologists of the world as properly designating a certain class of storms. The cyclone is a broad disturbance having a diameter of from 300 to 500 miles, and sometimes 1000 miles. It is a vast eddy in the atmosphere and moves along in that medium very much as the eddies in a stream of water. The air does not have an actual circular motion at any place within the storm area, but only a tendency to spiral movement.

But even this tendency is not revealed by reports from a single station. It is necessary to obtain observations from the entire area of disturbance, which, when plotted on a chart, discloses the general movement of the air gradually inward toward the center, where it rises to the upper cloud region and flows outward on all sides. This motion of the air gives rise to westerly winds south of the cyclonic center, southerly winds on the east, easterly winds on the north, and northerly winds on the west. At the center of the area there is a calm space 10 or 15 miles in diameter, known as the "eye of the storm." This is a very dangerous part of the cyclone for vessels to encounter, as they become motionless and are then suddenly caught at a disadvantage by the rear of the storm. The barometer is lowest at the center and increases outward to the circumference. The form of the cyclonic area is either circular or elliptical, generally the latter. The direction of progressive movement is from west to east under the influence of the rotation of the earth, and while not directly visible is apparent in the passing changes of the weather. The rate of movement is on the average about 30 miles per hour, being most rapid in winter, with a maximum of 50 miles, and least rapid in summer, with a minimum of about ten miles. The four quadrants of a cyclone have distinct and invariable characteristics as follows: In the northeast quadrant, great humidity, high winds, precipitation, and heavy clouds, especially in the southern portion. In the southeast quadrant, the maximum of heat and moisture, the region of all classes of local storms, especially the tornado. In the southwest quadrant, clearing weather, with dashes of rain in the eastern portion, falling temperature and diminishing humidity. In the northwest quadrant, the minimum of heat and moisture, general absence of clouds and brisk, cold winds. Some cyclones may preserve their identity in passing entirely around the earth, but the generality only make about one-third of that distance and then disappear in the general circulation of the atmosphere.

JOHN P. FINLEY,
Lieutenant U. S. Signal Corps, in charge.

DEEP COMSTOCK MINING.—As a result of the frequent meetings between J. W. Mackay, J. L. Flood, Alvinza Hayward, W. S. Hobart, S. L. Jones and others, who control the north and middle groups of Comstock mines, deep mining is to be resumed along the entire lode, after a lapse of five years. The pumping operations in the Crown Point incline are slowly reducing the water in the Gold Hill and south-end mine, and it is only a question of time before mining will be resumed in the lower levels of these mines. The decision which culminated on Tuesday in an agreement to the effect that deep mining will be resumed in the middle and north-end mines, completes the general plan. The initial step to be taken will be the placing of Cornish pumps in the combination shaft, to pump out the water until the hydraulic pumps can be recovered and set to work. Later, the pumps at the C. and C. shaft will be started. A plan has been arranged for the drainage of the entire lode, and it will be carried out with all necessary despatch. The action thus decided upon will tend to encourage those who believe that in the lower levels there are reserves of ore yet to be uncovered which may equal in importance the bonanzas of the past. In addition to the drainage operations, the question of a reduction in milling and transportation charges is being considered, and a plan to accomplish this object will most probably be adopted.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador Ledger, Jan. 28: The sensation at the Rose mine reported in my last has about subsided. The water that broke in from the old shaft is all taken out and work has been resumed. There is no change to note. There is but little quartz in sight, but what little there is has free gold visible to the naked eye and they hope it will lead to something permanent. The Sutter mine is still idle, but according to reports will start under a new regime in the spring. Making pipe for the Mahoney mine is under full headway. The iron is arriving as fast as they can make it. It will take about six weeks to make it all, when the work of digging ditch and laying pipe will be in order. Some men are now at work repairing and getting the mill in order, fixing the tail-race, adjusting water-pipes inside the mill, fixing up the batteries, etc. Altogether, it begins to look like business. The Lincoln is running along in about the usual way and is said to be paying. The sulphurets works are running full blast again.

El Dorado.

TOLL HOUSE.—El Dorado Republican, Jan. 29: The owners of the Toll House mine are nearly ready to start a ro-stamp mill at work on gravel from their mine. The machinery from a mill formerly in use on the ground has been moved to the vicinity of the shaft and put in complete order for work. Everything is contrived to handle the gravel with great economy, the machinery being self-dumping and self-feeding. Some fine-looking gravel has been obtained from the mine. We understand the company contemplates sinking another shaft farther west in order to reach some parts of the channel that cannot be drained through the present shaft.

ON THE DIVIDE.—Georgetown Gazette, Jan. 29: Being a visitor to Georgetown occasionally, I now give you a few notes of various localities of El Dorado county, notably the Georgetown divide. Having heard a good deal about the Van mine, my curiosity was excited to see it. I was very much surprised to see a well-developed mine, also a mill running in full blast, crushing and grinding what they call porphyry, but what scientists know to be decomposed quartz. There is a very large body of this quartz and from the easy way it is handled pays all expenses of running the mill (a Huntington) and prospecting the mine. When I was there it was supposed they had struck the ledge in face of cross-cut from the shaft, as they were hoisting some very rich ore. As I came over to Placerville I noticed the Taylor mine hammering away as usual, working a full force; also the Lone Jack mine, which is once more at work under its old superintendent, Mr. Lawrence. They have got the new Cunningham machine for hoisting ore and it is claimed to be the "boss," both for economy and power. I also visited the Alhambra mine, back of the Dalmatia, where J. M. Bryan, the superintendent, has got everything in apple-pie order, ready to commence crushing. He has been at work with a force of men for seven weeks cleaning out the tunnel and shaft, also putting up new machinery. For the short time they have been at work they have made things take on a different shape. As soon as the mine justifies it the company intend putting up larger works. There are quite a number of equally as good mines around, and all that is required is a little energy, backed up with some capital, to make them good paying properties.

Inyo.

CERRO GORDO.—Inyo Independent, Jan. 30: Good reports come from Cerro Gordo. There are better prospects now than at any time since the present management took charge of the mines. One six-horse team is kept busy hauling ore down from the hill to Keeler.

Modoc.

MINING TUNNELS.—Adin Argus, Jan. 29: There are two tunneling companies at work pushing tunnels into the heart of Hayden Hill, 15 miles south of Adin. The first company formed consists of C. J. McCoy, A. Greigg, B. F. Studley, C. A. Higgins and Dan McClane. They began their tunnel on the south side of the hill and are working northward, where they are told. The other company is composed of Messrs. Shanklin & Hornlein of Grasshopper valley, N. Bieher, and another gentleman whose name we did not learn. This company began their tunnel on the north side and expect to run it in a southeasterly direction for a distance of 3000 feet. Each company is confident of success and it is to be hoped they will find what they seek. No one can deny but that there are millions of dollars in the mountain if it is properly worked. Ten years ago the mines of Hayden Hill produced large quantities of bullion and times generally were flourishing in Big Valley on account of their success. During the past few years, for want of capital, but little ore has been taken out and business there has been almost suspended. The companies above named are composed of moneyed men and there is no doubt but that they will prospect until they find all the profitable leads.

Nevada.

THE HOLDSWORTH CLAIMS.—Transcript, Jan. 29: Jackson Lake in this county is as the bird flies, less than 20 miles in a north by east direction from Nevada City, although by the wagon-road it is about twice as far; and from Emigrant Gap on the Central Pacific railroad it is 16 miles by the usual course of travel. The lake has an altitude of about 6000 feet above sea level. Its out-of-the-way situation renders it but little known to the public, as comparatively few persons find their way there unless called by business. There are two men, however, who take intense interest in that part of the county. They are old prospector Holdsworth and his son, who have for a number of years endured the rigors of the severe climate there and submitted to being practically cut off from association with the rest of the world in the hope that they will eventually reap an independent fortune as a remuneration for their present abstinence from the luxuries of life. They have carefully and laboriously exploited the country thereabout with tunnels and shafts, and have come to the conclusion that it is the fountain-head of most if not all the gold mines that lie

between there and the Sacramento valley. They have made locations on six monstrous quartz ledges with well-defined croppings and all so situated that they can be worked by one tunnel that will give 1500 feet of backs, and they have christened these ledges respectively the West Point, Golden Gate, Golden Drop, Big Mountain, Red Top, and Red Top Extension. Scores of milling tests and assays have been made at this city and elsewhere of ore from the various deposits, and it is found to carry gold, platinum and nickel. In gold they say the lowest return has been \$20 a ton by milling. Two tons crushed last year at the Rocky Glen mill at Graniteville gave \$55 a ton, and it is contended that even then not more than half of the precious metal pounded out was saved. Capitalists went up there last fall and negotiated for the consolidated claims at the price of \$150,000 spot cash. But when they sent the papers up to be signed the Holdsworths found that a bond was what the capitalists were really fishing for. The papers are still unsigned.

AN IRON MINING CO.—Nevada Transcript, Jan. 30: There is a probability that a prominent iron mining company having smelting and other extensive works in Ogden and San Francisco, will shortly begin operations at this city. The company has this week through M. H. Brewer of San Francisco made eight locations along the rich and extensive deposits of iron ore situated on the northerly side of Deer creek, beginning at a point about two and a half miles below town and continuing to within a mile of Newtown, which latter place lies west from here. Negotiations for the property of Mrs. Hawke, forming the present eastern boundary of the company's claims, are now pending and likely to be consummated. The new locations are known as the Flora, San Francisco, Hidden Treasure, Iron Duke, Iron King, Lily, Monarch and Annie. The work of prospecting the property will be commenced without unnecessary delay, and it is expected that the erection of a smelter will immediately follow the favorable developments which are confidently anticipated because of what has heretofore been demonstrated as to the extent and value of the deposits.

A NEW GRAVEL MINE.—Transcript, Jan. 26: The Ogden brothers, experienced gravel miners, are engaged in developing the Gaylord & Bryant drift mine a quarter of a mile in a northerly direction from where the San Juan road crosses Rock Creek. The tunnel is in 180 feet and is evidently on the rim of a clearly defined channel, but it has been most of the way since starting in gravel (supposed to be from a break out of the main lead) which carries coarse gold. Various gravel miners contend that this mine is on the same channel as the Harmony, and that said channel instead of passing down through the Manzanita ground goes by way of the Nebraska and traverses the upper portion of Selby Flat, to the north of the Manzanita.

MINE BONDED.—Grass Valley Union, Jan. 31: The Washington mine, which is northeast of the Idaho mine and on the west side of Wolf creek, has been bonded by David Bryant from Herman Uphoff the owner. The Washington was a popular prospect some years ago, and it is believed will make a good mine if properly opened up.

ORMONDE.—Cor. Transcript, Feb. 3: There is considerable work going on at this place outside of the Washington Mining Co. Geo. W. Starr and Chas. Stokes of Grass Valley have a fine-looking property in the old Rodda ledge and its southern extension. The parties have already spent considerable money on the property in the way of purchase, annual work, etc. I am reliably informed that it is their intention to early in the spring resume sinking the old shaft which is now down 30 feet carrying a ledge six or seven feet in width and showing well in free gold and sulphurets. M. D. Cooley, superintendent of the German mine, is working five men all told. He has about 200 feet to run yet before striking his ledge. Henry Kohler of Washington is the owner of a fine-looking ledge close by the German, and running parallel with it on the west. Bright and early on New Year's morning two different parties relocated the Ocean Star quartz mine, which means more grub for some of the legal fraternity. Capt. D. S. Donohue has been at work till quite recently on his Uncle Sam ledge located near the mouth of Canyon creek. This property is one of the finest prospects as far as developed in this section. The White Brothers are developing a property on the north side of the creek from the Uncle Sam, which prospects quite rich in free gold, and several other parties are prospecting near by.

Placer.

REOPENING.—Placer Republican, Jan. 28: L. Remler, Dan Russell and Al, Ingram of Forest Hill have bonded the old Home Stake quartz mine in Volcano Canyon and are opening up the old tunnel which was run a distance of 630 feet years ago, but which was allowed to cave in and fill up. The ledge is about six inches thick, but the quartz assays from \$50 to \$100 a ton, and there is great confidence that it will prove a good property. Mr. Remler has lived at Forest Hill 30 years, but this is the first time he has ever invested in a mine.

THE PARAGON MINE.—"Considerin' everything, Abraham Breece and Judson Wheeler are prob'ly the two luckiest miners that ever struck Placer county," said an old resident of Forest Hill the other day. "They got the Paragon cheap, and in ten or twelve years have cleaned up pretty well on to three-quarters of a million in clear money." The old Paragon claim at Bath always has paid since 1857, both as a hydraulic and drift mine. The tunnel has not been worked on "scientific" mining principles. It wanders around under the mountain following the lead of the channel, and only gravel that paid has been taken out. The under lead, which is the one that has been worked and proved so rich since about 1880, has been worked to within about 20 feet of the May Flower ground, and when that remaining distance of 20 feet was worked out, old miners thought the gold-producing days of the Paragon would be over. But not so. Six or seven weeks ago the miners under the direction of Supt. W. H. Grenell were set to work prospecting a favorable spot about half-way into the tunnel, and the result is the discovery of a new and distinct channel running at nearly right angles with the old blue lead across the whole width of the Paragon claim. The old lead contained blue gravel and runs nearly north and south. The new channel is above the old one, contains red gravel and runs east and west. The distance across the claim in the latter direction is about

5000 feet. The old lead averaged \$18 a carload. The new red gravel averages only \$5 so far, but as Mr. Grenell has worked across it a distance of 185 feet and has not yet determined the full width, and as it costs only \$2.25 to mine and mill the gravel, the new channel may well be considered somewhat of a bonanza in itself. At present 27 men are working in the mine, but the force is to be increased.

Shasta.

NEW LOCATION.—Courier, Jan. 31: James Dow has undoubtedly struck it in a new location a few miles north of town. It is a six-foot ledge on the croppings, shows up on the surface for 60 or 70 yards, and prospects well in free gold and sulphurets.

TEXAS AND GEORGIA.—Shasta Co. Democrat, Jan. 29: The new Texas and Georgia ro-stamp mill and bucket tramway is now running like clock-work. Last Saturday the capacity of the tramway was timed, and in one hour it delivered 13 tons of ore at the mill.

LOST CONFIDENCE.—Last week James Salla of the Lost Confidence mine, Iron mountain, shipped 33,000 ounces of bullion, the cleanup from a month's run. The Lost Confidence is gaining the reputation of being one of the chief bullion-producing mines of the State.

THE GLADSTONE MINE on Kline gulch is one of the big bullion-producers of the State. Twenty stamps are in continual operation, producing about \$1000 a day, and yet this mine is in its very infancy. In addition to a complete milling plant, Supt. Clark has put in a dynamo plant and now lights the mill and all the buildings with an electric light, and in a few days the whole interior works of the mine will be lighted with an incandescent light. Everything about the premises is neat and inviting and the accommodations for the miners, 75 in number, are equal to any hotel in the county.

A COMPARISON.—Mr. Chas. Gruss, who mined in Deadwood last year and is quite well known here, a few days ago returned from an extended visit to Plumas county, and in a few days will go to Deadwood. In speaking of mines and comparing the mines of Trinity and Shasta with those of Plumas, he says the latter county's mines, which will produce ore that will mill an average of \$3 to \$5 a ton, are considered big mining properties and are operated on a big scale, while in Shasta and Trinity counties, mines that will produce ore that will not mill an average of \$10 or more are considered unprofitable. He says there is a world of ore in Shasta and Trinity that will mill an average of \$5, but in Plumas they would be developed into big paying properties. But most all the gold ore in Plumas is free milling and is reduced by water-power, and to that extent Plumas has a slight advantage over Shasta. The miners of Plumas utilize their natural water-power, while in Shasta the water-powers are not harnessed and put to use operating mining plants. Mr. Gruss is an experienced, practical miner. He believes Shasta county's mineral resources are second to none in the State, and if the miners of Shasta would take a few observations as to how low-grade ore is worked profitably in Plumas and apply those practical methods here, Shasta county's mining enterprises would boom.

Sierra.

SIERRA CITY.—Mountain Messenger, Jan. 29: The Young America Co. has struck a pay chute in No. 4 tunnel. The width of the ledge is not yet known, as they had not got either hanging or foot-wall. The company will soon be able to dispense with the tramway and dump the ore from the cars into the mill. The Berger mine is running only one battery, owing to want of water. The ledge where the men are now working is very wet. The Phoenix Co. has been sinking a shaft on the ledge, with fine prospects. Mr. A. C. Busch, who now owns the whole property, has given an order for lumber for a new mill which will be erected just as soon as it can possibly be done. The Colombo mine is running and looks very well. This promises to be a good property. Al Smith and Frank Stewart are sinking a shaft at Charcoal Ranch for a gravel channel.

Siskiyou.

THE BLUE LEAD.—Yreka Journal, Jan. 28: The Yreka Blue Gravel Mining Co. has been incorporated, the principal object of the company being to prospect the channel which is supposed to run near the town. For this purpose subscription lists will be circulated in a few days. If a sufficient amount is subscribed, certificates of stock will be issued to the subscribers and work commenced. All money paid for stock will be used in the actual expenses of prospecting, and if nothing is developed, and there is any money left, it will be returned pro rata to the subscribers. No assessments will be levied, unless rich developments in prospecting should warrant large expenditures in the future, in which case the stock will undoubtedly be worth more than its par value. There can be very little doubt, from all indications, that the channel, which is now generally conceded passes through this county, will prove a paying one, there being no reason why it should not pay as well in this vicinity as in the Cottonwood district, where it has been prospecting for six or seven miles. The surface indications are exactly the same. If the channel should prove to be rich, the result would be of incalculable benefit to the business interests of Yreka and the county generally.

Trinity.

TAPPED IT.—Journal, Jan. 31: Fisher Gulch Mining Co. on Canyon Creek has tapped the ledge on the Chloride location with the tunnel that they have been running for some time. At last accounts the tunnel had not been run through the ledge, so nothing definite is yet known regarding the quality of the ore. The mill on this property has been running regular during the daytime for about ten days, but the last few cold nights have caused the water to slack off so the mill has been shut down for the present.

NEVADA.

Washoe District.

YELLOW JACKET.—Virginia Enterprise, Jan. 31: Shipping 40 tons daily of ore worth \$18 a ton, as per battery assays.

JUSTICE.—The south drift from No. 1 winze, 490 level, was advanced 16 feet the last week; total distance, 92 feet; face in fair-grade ore. Shipped 183 tons of ore worth as per battery samples \$17.90.

KENTUCK.—The west crosscut from the north lateral drift, on the 950 level, was advanced 8 feet

during the week and reached the hanging-wall, passing through quartz of low grade containing pay. Started a raise in the lateral drift opposite the crosscut in quartz giving low assays. The raise in the east ledge on the 1000 level is up seven feet, and the top is in quartz containing occasional spots of ore. Have also started a raise in the west ledge, which is up seven feet in low-grade quartz.

CROWN POINT.—The northwest drift on the 500 level has been advanced 27 feet since the last report, and is now out a total distance of 155 feet. The face is in porphyry and quartz giving low assays. Will start a west drift from it during the coming week.

CON. IMPERIAL.—Work is still being confined to following up and taking out small streaks of ore on the upper levels and overhauling the old stopes of the mine.

BELCHER.—Have stopped the west crosscut from the south drift from No. 3 crosscut 300 level, and started an east crosscut opposite it. The west crosscut from the south drift in the west ledge, 300 level, has been advanced 40 feet, and is now out 100 feet. Have stopped it temporarily, and started an east crosscut opposite it. The 1400 raise has been advanced 15 feet, and is now up 65 feet. The top is in low-grade quartz. It is expected to connect with the 1500 winze in a very few feet.

OVERMAN.—Extracted 382 tons and 800 pounds of ore. Shipped to the Brunswick mill 390 tons of ore. Battery assays average \$14.17 per ton. Upraise from the northwest drift on the 1100 level has been extended 9 feet, passing through ore; total length, 124 feet.

CONFIDENCE-CHALLENGE.—The Joint Confidence and Challenge west crosscut from north drift on the 1100 level is out 113 feet. The face shows quartz having no value.

SEG. BELCHER.—The 600 level, south drift, has been extended 29 feet during the week, and is now out 129 feet; the face is in soft porphyry.

SAVAGE.—Milled 570 tons of ore, the average battery assay of which was \$15 per ton. Bullion on hand, \$19,777. On the 300 level east crosscut was advanced 27 feet; total length, 55 feet; face in porphyry. On the 1300 level we resumed work in the north upraise, which is now advanced 75 feet; the top is in ore—old fillings.

HALE & NORCROSS.—The west crosscut on the 800 level was extended 25 feet; total, 300. This drift has reached the west wall of the ledge at the end of the north drift on our north boundary line, and opposite the above-mentioned crosscut we have started an east crosscut and advanced same 10 feet in quartz and porphyry.

CHOLLAR.—Winze 80 feet south of north line, 750 level, is down 43 feet, bottom in quartz yielding low assays. Station from the incline, 1300 level, is in 10 feet. Repairs to the head main incline are nearly completed. Extracted and sent to the mill the last week 546 tons of ore, the battery assay of which was \$17.54 a ton.

POTOSI.—East crosscut from winze, 1130 level, is out 135 feet. In the face are bunches of quartz yielding assays from \$6 to \$20 a ton.

EXCHEQUER.—East crosscut, 150 feet south of north line, 500 level, is out 440 feet; face in porphyry. East crosscut near the south line, 600 level, is out 276 feet; face in clay, quartz and porphyry. East crosscut on the north line, 600 level, is out 50 feet; face in clay and quartz.

ALPHA.—The south drift from east crosscut from shaft, 600 level, is out 26 feet; face in quartz giving fair assays.

SILVER HILL.—Northeast drift, 160 level, is out from the winze 610 feet; face in porphyry. Northwest drift, 334 level, is out from shaft 835 feet; face in porphyry.

NEW YORK.—East crosscut 100 feet north of shaft, 4100 level, is out 34 feet; face in clay and quartz. East crosscut 200 feet north of shaft, 1100 level, is out 32 feet; face in porphyry. East crosscut 260 feet north of shaft, 1100 level, is out seven feet; face in clay and porphyry.

WARD COMBINATION.—East drift from shaft, 1800 level, is out 805 feet; face in porphyry.

ANDES.—During the past week north drift, 420 level, was advanced 16 feet in a formation of quartz and porphyry. East crosscut from south drift on 420 level was advanced 10 feet; face in clay and porphyry.

GOULD & CURRY.—200 level: In northwest drift, at a point 125 feet north of west crosscut No. 2, started west crosscut No. 2 and advanced same 15 feet, passing through quartz showing some value. 250 level: West crosscut No. 1 has been extended 25 feet; formation porphyry with streaks of quartz; total length, 60 feet.

BEST & BELCHER.—800-foot level: West crosscut No. 2 has been extended 16 feet, through porphyry, clay and quartz; total length, 448 feet. 1200 level: West crosscut No. 1 has been extended 18 feet through porphyry, clay and quartz; total length, 89 feet.

OCCIDENTAL.—During the week the work in the mine has been confined to repairing and retimbering the main tunnel on the 550 level.

UTAH.—On the 725 level the northwest lateral drift from the main west drift from the shaft has been extended 37 feet; total length, 369 feet, in a porphyry and clay formation.

Highland District.

THE MENDHA.—Pioche Record, Jan. 29: At the Mendha mine, Highland District, work on the new hoisting shaft goes steadily ahead and it has now attained a depth of nearly 300 feet. A great deal of work is connected with it, however, and a month will probably elapse before the lower workings are tapped, when the output of ore can, if necessary, easily be doubled. In the other workings, the mine looks as well as ever, and new ore is being uncovered every week.

Jackrabbit District.

DAY MINE.—Pioche Record, Jan. 29: The new ore find in the Day mine mentioned by us two weeks ago, has developed into a magnificent thing itself, and the end is not yet. The strike was made above the old working tunnel level on the west side of it and about 700 feet from its mouth. The ore has been drifted on for a distance of 75 feet, and raised on for the same distance, and the work is still going on. The walls range from 4 to 18 feet apart and will average 10 feet. The ore differs both in appearance and analysis from the average ore of the mine, containing 8 to 10 per cent silica, and will average 40 oz. in silver per ton when knocked out and no sorting. Picked samples range from 60 oz. to 600 ozs. per ton in silver. In the

tunnel also, which is going in west of the main working tunnel and parallel with it, good ore was struck six days ago. In character it strongly resembles that of the new strike, the vein being as wide as three feet, with an average of 12 inches. The ore here runs at about 35 ozs. silver per ton. This tunnel is running toward the new strike and will pass in under it, but is yet 500 feet distant. The management is highly pleased over the outlook.

TUSCARORA DISTRICT.

DEL MONTE.—Tuscarora Times-Review, Jan. 30: First level: North crosscut advanced, cutting streaks of low-grade ore.

NAVJO.—Stopes below the 350-foot level are looking better and producing a good grade of ore. **COMMONWEALTH.**—Fourth level: East crosscut advanced 28 feet; west crosscut being repaired.

NORTH COMMONWEALTH.—Through combination shaft—First level: Stopes produced 15 cars of first class ore assaying \$378 per ton, and 70 cars second class assaying \$26 per ton.

BELLE ISLE.—Stopes on the 350 foot level continue to look very good indeed. A crosscut has been made through the ledge at the south end of the intermediate, showing some rich ore on the west wall with a large mass of concentrating ore. Work has been resumed in the face of the west crosscut, progress 3 feet, face looks very encouraging. Sent 232 tons in concentrator, estimated assay value \$34.43, giving 20.15 tons wet concentrates, estimated assay value \$251.61.

NORTH BELLE ISLE.—East crosscut, 400 level, extended 20 feet. North drift from Belle Isle 450 extended 12 feet, vein large, showing bunches of good ore. Joint east crosscut, same level, extended 15 feet and suspended. The 500 stope has improved since last report. South intermediate from No. 4 chute extended 10 feet, total 19 feet south of the vertical winze, the face shows six inches of solid ore. Have resumed work in No. 4 upraise, 600 level, progress 9 feet, in hard quartz. Concentrator crushed 232 tons Belle Isle ore, assay value \$34.43, yielding 20.15 tons concentrates, assay value \$251.61.

ARIZONA.

GUNSGIGHT CAMP.—Tucson Citizen, Jan. 30: Mining progress in Arizona has never been more rapid nor more encouraging than during the past year. In all parts of its domain new properties are being opened and old ones reopened. This is due to various causes. Favorable legislation has given it an impetus, but not in all probability such a one as have improvements in mining machinery. Old mines have worked under the constant disadvantage of rude and clumsy machinery, bearing the comparison to the present mining apparatus that all modern improved machinery does to its predecessors. Improvements in mining machinery have fully kept pace with others, and mines once worked at a loss are now made to bring good and profitable returns. The Gunsight mine, 125 miles southwest of Tucson, is one of the pioneer mines of Arizona. The Spaniards worked it, and for the last 35 years Americans have been in possession of it. Its teams have thronged the road to Gila Bend, its railroad outlet, and its enormous output has been bewildering. Something like a million dollars have been expended on this camp, but only at times has it been profitable. The ore, which is a good-grade silver, has been worked with the old style cannon-ball process mill, which extracted but a share of the real value of the ores. Different companies have been in management of it, but the machinery was so utterly inefficient that the enormous outlay on the property brought poor returns, and its great dumps of ore piled high were never worked. Gradually its large force of workmen was reduced, until but 12 or 15 men were employed, milling the best of the ore. Now the old regime is at an end, and Gunsight will again take its place as a prominent, and this time a profitable camp. A party in from there states that it has been placed under the superintendency of J. C. Rankin, a practical mining man, who will work the ores on the dump and some of extra value lately uncovered in one of the old shafts, by a new and profitable process, which will extract almost their full value. The mill will be of a 20-stamp capacity, and is now being put in. The scarcity of water is at present something of a hindrance to the working, but will soon be remedied by cleaning out the wells. The work of rebuilding, renovating and removing debris will be pushed with all speed. The camp is to be worked for profit, and it is a matter of congratulation that the old mine is no longer to be almost deserted, but will team with life and business.

FROM TABLE MOUNTAIN.—Tucson Star, Jan. 30: Capt. J. D. Burgess is in from his Table Mountain camp, Pinal county, and reports everything rubbing at the Mammoth. Louis Ezekiel is delivering lumber sawed in the Santa Catalinas to the Mammoth Co., for use in the mine. A number of men are doing prospecting and development work in the McGarrish and Bunker Hill districts; much rich ore is being taken out at Stringerville for shipment. The Table Mountain mines are developing finely and great bodies of copper ore rich in gold are being shown. Rumors of nearly consummated sales of several mines in the vicinity of the Mammoth are prevalent, and as the mines are known to be good ones, a boom is looked for in the near future.

COLORADO.

MIXSELL MILL.—Idaho Springs News, Jan. 29: There is a great demand on the Mixsell mill at present. Mixsell says he could run 50 stamps steady if the mill was supplied with that many. The Casino mine produced from last May to January 1, over 240 tons of ore valued at \$14,600. In that time 700 feet of drifting was done. The Treasure Vault, which is under the management of Foulk Williams, made a shipment of two lots of ore to Chamberlain & Co.'s sampling works this week. The handsome return of 27 ounces gold per ton was obtained from the first lot. The second lot gave returns of ten ounces per ton. A. A. Hoskin has just let a contract to drive a crosscut tunnel to reach the Tarbet lode in Squirrel gulch. This property is now owned by Evan Davis of Wisconsin, who will push the tunnel to the lode as rapidly as possible. It will tap the vein at 600 feet from the surface.

THE DEEP SHAFT.—Aspen Times, Jan. 31: The level that has been run from the Deep Shaft into the Enterprise ground has struck the contact. It was

reported that a good body of ore had been opened, but this is denied. The contact is found to be very wet and a large volume of water has been flowing out through the level. It is thought, however, that the contact will soon drain out.

THE ASPEN.—The Aspen mine is now employing 275 men. The output has been increased a little and is now nearly up to the old figures, the weekly shipments footing up to 900 tons.

SMEILER AT GRAND JUNCTION.—H. K. Devereux came up Saturday from Grand Junction. He reports that arrangements have been made to connect the Tintic district in Utah with the Rio Grande Western road. This, in his opinion, means that a smelter will be built at Grand Junction. He met General Palmer at Glenwood and that gentleman told him that works would be established at the point indicated in a very short time.

THE EDISON No. 2.—The lessees of the Edison No. 2 held a meeting last night. The resignation of Manager Thomas Kerwin was accepted and James Warner was elected to the position. The mine is now looking much better than ever before. No ore is being shipped except what is taken out in running drifts. The ore body holds out well and stoping ground is being prepared. There is a good five-foot vein of ore in the mine and the lessees will reap a rich reward.

DAKOTA.

CHLORINATION WORKS.—Deadwood Pioneer, Jan. 28: The new barrel for the chlorination works, ordered by Harris Franklin while in Chicago, will be four, and not five tons, as heretofore published. It is expected here about March 20th, and will increase the capacity of the works to 70 tons per day. Shipments of ore from the Golden Reward to the works still continue.

D. & D. SMELTER.—Bids for furnishing lumber for the new D. & D. smelter were opened yesterday, and the contract was awarded to Col. W. M. Pratt, his bid being the lowest. Work on the foundation is progressing nicely.

CALEDONIA.—Richard Blackstone has been appointed superintendent of the Caledonia, and he will take charge of the property, together with the De Smet and the B. H. & Ft. P. R. R. It is rumored that he will shortly resign his position as superintendent of the railroad.

RICHMOND MILL.—The Richmond mill at Galena started up Monday, and is now running in full blast. A partial cleanup was made yesterday, and the result was highly satisfactory to Supt. Havens. All the ore is coming from the Richmond mine, and is looking better than it ever has before.

MONTANA.

THE ELIZABETH.—Phillipsburg Mail, Jan. 27: There has been considerable excitement about this property both here and in Helena and St. Louis for some time past, and particularly for the past week or so. The immediate cause seems to have been a report telegraphed to St. Louis by Supt. Wier announcing 15 inches of ore in the east drift of the north crosscut. While this of course is true, it appears that the ore is of low quality and nothing to go wild over; but there is no doubt in the world but that ore of good grade and plenty of it will yet be found in the south vein, between their present workings and their eastern end lines.

HATTA.—This company is still sinking, and the shaft is now about 320 feet in depth and the new hoist is handling the water in good shape, but more water is expected as depth is attained. Supt. Holland came up from the mine the other day and says that they now have about 700 or 800 tons of ore on the dump, but not of very high grade. The shaft at present seems to be in the vein and the ore is daily increasing in value. They now have from 8 inches to one foot of gray copper that assays well.

A LESSON IN MINING.—Review, Jan. 29: The Golden Leaf M. Co. which owns the old Empire property, some four miles west of Marysville, is teaching all the mining companies of the State a lesson in cheap mining. The property of this company is not advantageously situated. The 60-stamp mill is nearly a mile from the mine, with which it is connected by a tramway. All the machinery at both the mine and mill is run by steam; water is scarce and cannot be freely used, and the site is four miles from a railroad, over a mountain road with very steep grades. The work of mining and milling is done by 50 men. During the month of December the expenses of the mill and mine (and everything used was accounted for) were \$7100. Four thousand tons of ore were milled, the average assay of the ore being \$3.70; the assays of the tailings showed \$1.20, leaving the value of the metal (gold) extracted at \$2.50. So the gross product of the mine was \$10,000. In addition to this there was 3000 tons of ore in the bins of the mine and mill, and the workings of the mine were in much better condition than they were in the beginning of the month. This shows that Mr. J. Henry Longmaid, the manager of the company, thoroughly understands his business, and that he has an able corps of assistants and good workmen. Mr. Longmaid sets them all a good example, for he does what is ordinarily the work of four persons. He is manager, superintendent, assayer, bookkeeper, and timekeeper. The company will not permit a saloon on the place, and neither is there a gambling house, yet Mr. Longmaid says that he has many applications for work from men who know these facts, which he is unable to grant. The plant, outside the mine, is worth about \$200,000, and if this property can return a profit under such circumstances, with the same industry, energy and economy, nearly every mine and mill and smelter in Montana ought to make money.

IDAHO.

DELAMAR.—Idaho Statesman, Feb. 1: Besides the world-renowned DeLamar mine, several other rich mines will be opened up and worked with large crews of men early in the spring. Under the careful guidance of Dr. Munson, superintendent, and J. M. Healy, foreman of the main workings, a Statesman representative went through the mine. At a depth of some 400 feet from the surface one comes upon a vein of ore 80 feet in thickness, which is very rich in both silver and gold. As fast as the work of developing the different drifts and tunnels is completed, substantial frames are put in place to prevent accidents from caving walls, which gives an

air of solidity to the whole works. Everything is done to secure the safety of the men and the most rapid handling of the ore. About 200 feet above the hoist works and carpenter shops is located the mouth of the upper tunnel and works. Here is also the Anchor shaft, named after its discoverer, H. C. Anchor, who is foreman of this division. It is here that several nuggets of almost pure silver have been discovered, one weighing something over 26 pounds and valued at \$8 per pound. The men working in this department average two sacks of high-grade ore per day, each sack valued at \$40. Thus we see that no one can even estimate the fabulous wealth represented by this (the DeLamar) group of mines. To facilitate the rapid handling of ore in the lower tunnels, Capt. DeLamar intends placing on the upper levels powerful electrical hoists, a part of the machinery for which is on the ground.

BRIGHTER PROSPECTS.—Salt Lake Tribune, Jan. 29: Frank Willis, who is down from Custer county, Idaho, says that the mining prospects in that county are much brighter than a year ago. The mines that are being operated are looking better than usual and more ore is being opened up. Just as he was leaving home there was a rumor that a good strike of ore had been made in the Post Boy in the tunnel on which work has been progressing the past year. The Post Boy is on the Ramshorn hill and on the same mineral belt as the Ramshorn, Skylark and several other mines which have been producing so largely the past 10 years. The winter has been very pleasant on Salmon river so far.

STORMY HILL.—Avalanche, Jan. 31: Mr. Longmead returned from Salt Lake and Mr. H. Stephenson from Baker City, during the week. They found on their return that work had been progressing favorably on the Stormy Hill shaft which is now down 260 feet. The ledge has widened slightly, and Mr. Harris the foreman was able to show them some rich samples of ore taken from the bottom. When the shaft is down 300 feet they will begin running drifts both north and south. The mine now looks so promising that it quite assures the building of a mill on the mountain to work the ore taken out. This mill will be built in South Sinker gulch, near where the Lightning creek road crosses, where the owners have secured a site and located water rights.

TRADE DOLLAR.—The winze, which was sunk to connect tunnels 1 and 2 on the Trade Dollar is now down to level of No. 2. The face of No. 2 level is still 270 feet south of this winze but is being pushed by a double shift to a connection with winze, the ore growing better as the tunnel is advanced. In the face of No. 1 tunnel which is now 128 feet north of the winze, the ledge has two streaks of ore, one four and the other three inches wide, of high grade.

BLACK JACK.—The manager of the Black Jack is still working the Rand drill on the ledge recently struck. The drift is now run south of the tunnel 60 feet. The ledge at this point is four feet wide, ten inches of which is very rich and the balance good milling quartz.

NEW MEXICO.

MOGOLLONS.—Silver City Enterprise, Jan. 30: Geo. Rowe & Co., lessees of the Consolidated claim, which lies to the south of the Mountain Key upon the same vein, are working four men. The shaft is down over 100 feet. Sufficient high-grade ore to pay expenses is being taken out and shipped. A big boom may be looked for throughout this entire camp when spring opens. The Confidence Co. are driving the main level on the Confidence ahead and are now in 670 feet from the opening at the gulch. Work has been suspended on the old location shaft at a depth of 90 feet below the main level, a total depth of 215 feet. The shaft shows fully six feet of milling ore worth from \$28 to \$45 per ton and which will probably average \$32 to \$35 in a mill. Captain Frank Vingo, superintendent of the Mogollon Consolidated Mining Co., is pushing business on the Little Fanny. Everything about the mine is being put in shape for a long and good paying millrun. A few men are taking ore from the old Sheridan mine which will be run at the mill. The Last Chance Co. have most of the machinery for their 20-stamp mill on the ground. The grading of the millsite is completed and the framing of timbers is rapidly progressing.

PYRAMID PICKUPS.—Western Liberal, Jan. 30: A number of additional hands have been put to work during the past week. The fame of the old camp is being spread, and miners looking for work are coming in almost daily. Messrs. Lincoln and Butnub are developing their property; it was formerly known as the Henrietta, and has produced some good ore. The ore was shipped to Freiberg, Germany, and after paying all expenses, netted the company a handsome sum. Some good ore is being extracted from the stopes on the 100-foot level in the Viola. The lost lead, or rather the one which had never been really found, has been caught in the east crosscut of the south drift on the 100 level. The superintendent and all hands are highly elated over the prospect of a big mine. The vein is as yet small, but is widening every foot it is penetrated. The ore is a high grade of sulphuret, and closely resembles that of the Bob Lee, which is sufficient guarantee of its excellence.

OREGON.

OREGON MARBLE AND LIME.—Bedrock Democrat, Jan. 29: Mr. W. L. Peak, manager of the Oregon Marble & Lime Co., called yesterday. The base of operations of this company is four and one-half miles west of Huntington in the Burnt river canyon, the railroad running within a few rods of the company's works, thus enabling the company to place their product on the cars at a very trifling cost. The capacity of the works is one hundred and fifty barrels of lime per day and two carloads of lime rock per day. The company employs about twenty men and will increase that number shortly. Mr. Peak tells us that his company finds a splendid market for their lime as far east as Wood River and west throughout Oregon and Washington, their lime being the equal of any on the market. The lime rock is used as flux for smelting purposes and a ready purchaser for all the company can supply is found in the Oregon Iron & Steel Co., whose works are located at Oswego, Oregon. Mr. Peak is now busily engaged enlarging the present plant of the company, building kilns, etc., in anticipation of a heavy run the present year. The company is com-

posed of a number of very wealthy gentlemen, among them William Ladd, banker of Portland, Thos. Rourke, of the First National bank of Pendleton, and Sutton & Beebe, ship-chandlers of Portland.

UTAH.

DEEP CREEK INTEREST.—Salt Lake Tribune, Jan. 30: The Deep creek interest still keeps up among prospectors and mining men. Properties are being secured by investors, while quite a number of small syndicates have been out prospecting and making locations. One incident shows the interest and confidence that men in this city have in the Deep creek mines. A week or so ago town lots at Clifton, a prospective mining town for that one district, were put on the market at \$25 each, after which the price was raised and this week 27 lots have been sold at prices ranging from \$50 to \$200 per lot. The value of the 20 or 30 mining districts out in that country depends greatly upon the early building of a railway thither. The low-grade ores, in which the country chiefly abounds, cannot be mined and marketed to profit without a railway, but there is such a feeling of confidence that the road will soon be constructed as to have doubled the values of the mines and prospects in the estimation of their owners and would-be purchasers. Mr. Bacon is expected back in two or three days, and he ought to bring good news regarding the railway. There is fair prospect of some gold mills going into the Deep creek country before long, even if the railway does not begin to materialize soon.

NEW STRIKE IN COTTONWOOD.—McVicker made an assay yesterday of some ore sent from Little Cottonwood, which went 55 per cent lead and 94 ounces silver. It is claimed to be from a new strike in the vicinity of the Emma mine.

STANLEY AND CONGO.—The Stanley mine, Big Cottonwood, has about 100 tons of ore on the dump ready to send to market when the roads open in the spring. The Congo is also getting out. These two properties are doing well and their stocks are both rising in value in the Exchange.

THE WALL MILL AT OPHIR.—Col. Wall came in from Ophir yesterday. He has his mill in complete order and would have it running but the weather is so cold there that the water-power is in too solid lumps for his purposes. He hopes to get started soon.

STRIKE IN THE TURK.—The Turk mine, which only began genuine development lately, and which is at the head of Dragon hollow, Tintic, appears to be in luck. Only a few days ago they made a strike on good ore and now, in continuing their work, have gotten on to even better ore. The Turk was owned by persons who did little work on it until Dr. Chamberlain got hold of the property last fall and has been developing it. Later a company was organized among some gentlemen in this city, and work has been going on finely ever since. The last ore struck is reported to be gray carbonates and to run very high in silver. The company has an option on the Martha Washington and June Rose, near Silver City, of which the former is already a shipper of good ore.

THE SNOW WILL HINDER.—Salt Lake Tribune, Feb. 1: The storm will probably cause some of the mines to stop shipping ore, while in others it opens the way for hauling from the mines. Both the Ontario and Daly had to suspend ore hauling the past two or three weeks because there was too much snow for sledding in, and too much for wheels, but the late fall of snow has made the roads all right for the hobs, and ore hauling has been resumed. Ores are coming in pretty regularly now, and the smelters are getting about enough to keep their stacks running. The usual amount of Nevada ores coming in.

HANAUER SMELTERS.—The Hanauer smelters keep their furnaces running, and have a good stock of ore on hand.

ASSAYING JACKSON ORE.—Hodges was busy making assays yesterday, among which was 15 tons of Jackson ore from Eureka, Nevada.

CONCENTRATES RECEIVED.—Creole concentrates to the amount of 45 tons was assayed yesterday. It ran 40 per cent lead, 34 ounces silver and one-tenth ounce gold. This was concentrated at the Crescent mill and it went to Denver.

DRY ORES.—A large portion of the ores coming in are of the dry kind, such as the local smelters do not care to reduce. This suggests an opening in this valley for a custom mill for treating such ores as carry but little or no lead. There is much of this class that could be reduced better in a mill than by smelting.

WASHINGTON.

THE STANDARD OUTLOOK.—Ruby Miner, Jan. 29: Phil Perkins and W. S. Wiggins are making a great showing on their Standard mine just north of town. Sinking on a ledge at a distance of 25 feet there is now in sight a 4-foot body of ore, of which 2 feet is mineral which will average 200 ounces of silver and about 30 per cent lead per ton. Specimens go away up, but they don't go anything on that. It is the large body of high-grade mineral which now pleases the fortunate owners. Phil Perkins says that after exploring the ledge at his present position he will immediately run in a tunnel to tap it 100 feet deeper.

MORE PLACER TALK.—Benjamin Hall spent a couple of days in camp last week and returned Sunday to the Similkameen where he is engaged in mining. Mr. Hall is enthusiastic over the placer grounds of the Similkameen, and his good judgment in mining affairs makes his views interesting. Said he: "With a diving suit I could bring up \$5000 gold in two weeks from the bed of the river. There are numerous pot-holes where men with an ordinary shovel have scooped up from \$50 to \$100 a day and this too where a strong current swept away a large part of the gold before it could be lifted to the top. The scoop shovel can only be used in shallow water where, of course, the current is swiftest, but with a diving apparatus a man could go into deeper waters where the largest deposits exist. I do not understand where that gold comes from. The river is crossed by ledges which on one bank are a porphyry and on the other a pebbly or modern formation, and while carrying gold scarcely account for the large quantities which are known to be deposited in the river." Mr. Hall reports that the ditch which is to carry water to Bob Allison's placer grounds, some two miles from the river, is about completed.

MECHANICAL PROGRESS

Cast Iron vs. Wrought Steel Columns.

In searching for information as to the relative advantages of cast iron columns over those made of steel, we have had communicated to us the six lucid and forcible reasons which follow, showing why cast iron is to be preferred: 1. Economy. Cast columns are much less expensive than steel columns required to carry the same load. 2. Speed of delivery. Cast columns can be entirely supplied by all foundries. Much less time is required for manufacture of cast iron columns than for the riveted steel work. 3. Adaptability. A cast iron column can be made of any shape desired. Connections can be arranged for attaching other parts of the construction much more readily and satisfactorily than can be done in the use of steel columns. 4. Value as scrap. In case buildings erected are to be reconstructed or demolished, the cast iron as scrap has a much higher value than the steel. 5. Corrosion is much less rapid, and much less destructive to cast iron than to steel. Cast iron may be exposed for years and show very little loss from rust. Steel after an exposure of a few months will deteriorate very rapidly, the whole surface of the metal peeling off repeatedly in scales, while anything is left. 6. Cast iron columns have been well tested by use during a very long period. Steel columns are still an experiment. What time will do with large structures supported by riveted work and liable to rapid corrosion remains to be seen.

To the strong and impressive reasons, above specified, we are able to add the personal knowledge of some experts that, in several of the lofty buildings in Chicago, cast columns were furnished at 35 per cent to 51 per cent less than estimated for steel columns—a verdict of experience which speaks with a very loud emphasis on the question of relative cost. The same authorities tell us that they have often found the sustaining capacity of cast columns as much as 100 per cent greater than that of steel columns for same load and use. Positive facts like these are ramparts of certainty, alien to all the processes of theoretic assumption, and they greatly strengthen the position occupied by the advocates of cast iron columns. It should be distinctly and fully understood, however, that the decided superiority claimed for cast iron columns over the customary riveted work of steel has no reference whatever to tensile property, or power to resist the strain of drawing apart, but relates to power to resist the crushing strain of superincumbent weight, a column's capacity to hold up against pressure without giving way being its supreme standard of excellence. So far as our inquiries have extended, we have not found any record or any recollection of cast iron columns breaking by pressure from over-weight. The absence of such an event from a wide range of experience possesses a significance which requires no comment. Among the other advantages claimed for cast iron is greater safety in case of fire, as the liability of the riveted steel article to warp, curve and yield under the influence of severe heat is a defect in any upright support loaded with a heavy mass.

In regard to comparative tendency to corrosion, there is really no dispute, as even Carnegie, Phipps & Co., in an article in their own book on structural steel, state that the liability of rust or oxidation is greater in steel than in cast iron.

One competent authority expresses the opinion that "the great and effective arguments in riveted wrought columns are that rolling produces sound, uniform material which can be inspected easily, while cast iron is liable to hidden defects which the average architect cannot discover, and consequently never feels safe about." This authority tells us, finally, that "if cast iron is good enough, and can be produced sound enough, for locomotive cylinders, it certainly will regain its lost ground for building purposes, when the makers wake up."—*Industrial World, Chicago.*

A NEW METHOD OF ALLOYING IRON AND STEEL WITH ALUMINUM.—Our attention has recently been drawn to an invention which promises to come to the front as a new and important agent in the manufacture of iron and steel, and which has special interest to all iron-founders, inasmuch as it increases the fluidity of the iron, securing better metal and thoroughly preventing blow-holes and faulty castings. The wonderful improvement iron and steel undergoes when a small quantity of aluminum is mixed with it in a molten state has long been known; but the great cost of the material, its easy volatilization, and the consequent impossibility of using it with any kind of blast, have so far stood in the way of generalizing its employment in furnaces on a large scale. Its use has, therefore, been mainly confined to manual mixing in crucibles, but the result is not always satisfactory, the iron frequently becoming streaky and showing undissolved needles of aluminum. The present invention seems to remove these serious objections and to open up an entirely new era for the employment of aluminum on a large scale, inasmuch as the expensive commercial aluminum will no longer be used, but a cheap flux very rich in alumina and easy of reduction in a blast furnace. This flux, when brought into a fusing state in the presence of molten iron or steel, gives off metallic aluminum gases or

vapors having a strong affinity for the metal, and the iron in this state absorbs these gases in *statu nascendi*, thus forming not a mere mechanical alloy, as in the old process, but a new and perfect metallic compound of great tenacity. Mr. T. Freeman, F. G. S., of 200 Phoenix street, London, has been deputed by the patentee to make the necessary arrangements for the introduction of this new system. —*Colliery Guardian, London.*

THE WONDERS OF SCIENCE multiply. Some prove fakes, some are harnessed as everlasting verities. One is announced in Switzerland. Dr. Mandruff, of Geneva, claims to have invented a machine, described as a simple device; a solid sphere of copper, 40 centimeters in diameter—about 16 inches—contained within a sphere of zinc 50 centimeters in diameter. The two spheres revolve in opposite directions at a rate of 500 revolutions a minute, and the space between is kept filled with steam at a pressure of six atmospheres. It is said that from a half horse-power of motive force an electric current is developed sufficient to run 500 incandescent lamps. As ten lamps are reckoned to a horse-power, this means 50-horse power in electricity. Until further verifications are received this discovery must be taken with several grains of allowance. In the above connection we find the following: Another marvel is announced in the shape of a photographing phonograph. M. Leon Esquille, a Mexican, is said to have perfected a marvelous invention in electricity and photography. By speaking into a photophone transmitter, which consists of a highly polished diaphragm, reflecting a ray of light, this ray of light is set into vibrations, and a photograph is made of it on a traveling band of sensitized paper. If the image of this photographic tracing is projected by means of an electric arc or oxyhydrogen light upon a selenium receiver, the original speech is then heard. What next?

WINDING WIRE SPRINGS.—In winding an open spring of wire, all that can be calculated on its reflex force after being "shut," or compressed, are the elements of material of the wire, temper of the wire, size of the wire and diameter of the coil. These calculations are easily made, or so easily that any error may be easily rectified, if the spring should not prove yielding enough, by stretching its coils apart. But a close spring is a different matter. In this there should be more than a closeness of coil; it is requisite that the closing-up inclination of the coil should be greater than the opening resistance, in order to get the greatest power from the spring. This condition may be obtained by holding the winding wire back toward the winding end, even if the leader is "off" from the open end, if the wire is strong enough to sustain the tension, as the result will be an apparently open-wound spring, that is, a closely coiled spring as soon as the end is released. To increase the intensity of a spiral spring (close wound) the wire should be twisted in the winding, the direction of the twist being against the line of the pull on the wire. —*Scientific American.*

IMPROVEMENTS IN STEAM HAMMERS.—Io Obemnitz, the great tool-making center of Germany, there have been made some improvements in steam hammers that are worthy of notice and in keeping with the tendencies of other steam machinery of our day. The hammers have two cylinders and two piston-heads of different area, that operate on the principle of a differential engine; the steam, acting first in the same cylinder to raise the hammer, is then exhausted into the large cylinder, to make the down or working stroke. Heretofore steam hammers have been wasteful machines, the steam being used without expansion and the "clearance" in short strokes being lost. The differential plan seems a good one, if there are also arrangements to use initial steam both above and below the pistons when required. —*Industry.*

UNITING ALUMINUM TO GLASS.—A Cincinnati expert, it is said, has succeeded in uniting aluminum with glass. If this be true and can be practically done, it promises to make a great revolution, especially in the construction of incandescent electric-light globes. It has been the study of scientists for years to find a metal which would unite with glass in which the contraction and expansion were equal, and as far as nothing has been found available except platinum, the cost of which is enormous and the supply limited. It is therefore with a great deal of interest that the development of these experiments will be watched, and it is to be hoped that something has at last been found which will in every sense of the word "fill a long-felt want."

A HINT FOR A FOREMAN.—One of the good points that should be seen in a foreman is the ability to look ahead and see what is coming and have all the difficulties provided for as fast as they appear. It is something like a man laboring under a heavy-loaded wheelbarrow; you can help him about as much by knocking out the little trigs and obstructions that are likely to come before the wheel, so as to make it all smooth work for him, as you can by seizing hold of one arm of the barrow and rushing recklessly over everything by main strength.

SOLDERING ALUMINUM.—It is costly work to solder aluminum, for the parts must be sweat full of gold first before the solder can be made to take hold.

SCIENTIFIC PROGRESS.

The Obliquity of Planetary Orbits.

In an article in a recent number of *Nature*, the opinion is expressed that "the only plausible hypothesis to explain the inclinations of the axis of planets upon their orbits" is that at some time they have been struck by comets. A correspondent of the *Scientific American*, in commenting upon that theory, says: "The writer, no doubt, infers this from the ring theory of Laplace. If the sun, at the time of the formation of a planet, were a perfect sphere, it is difficult to see how the planet could be formed, by natural causes, in any other way than as a ring. But was the sun a sphere? It seems to me much more probable that, during its nebulous state and during the generation of the planets, the sun was an irregular mass of vapor, some parts being more distant from the center than others. Such higher parts, situated toward its equator, but not necessarily in it, would have a greater velocity than the general surface, and thus would be compelled by centrifugal force to separate, one after another, from the main body, to become planets.

"If this be so, they were thrown off, not in rings, but in masses, the largest ones first, as on the separation of each one the sun would become more regular in form and the protuberances smaller. These bodies, thus torn from the main body, would not be likely to assume revolution on axes exactly perpendicular to their orbital motion, and I would thus account for the obliquity of their orbits. In the meantime the parts of the sun toward its poles, having less rotary velocity than the equatorial parts, would fall more rapidly toward the center, and thus contribute to its spherical form.

"There is no sign anywhere of ring planetary formation, unless in the case of the rings of Saturn, and perhaps that of the asteroids, which may be fragments of a broken ring. But we see that in neither of these cases was a globe the result."

In reply to its correspondent, the editor of the last-mentioned journal says:

This theory is fully as plausible as the one advanced by Leontar in the article on "The End of the World," in our issue of Oct. 4. Yet both, being of accidental nature, do not accord with the uniformity of axial and orbital inclination of every individual body forming the solar system, the only exception being the system of minor planets, which seem to be the remains of an accident to some large planet originally occupying a normal place in our system. The axial positions and orbital relations of all the bodies of the solar system, from the sun to the remotest planet, seem to be due to the slight perturbations from the irregular flight of comets, meteors, and of interplanetary gravitation through the vast myriads of years that have elapsed since the dawn of their individualities.

ARTIFICIAL MUSK is a recent chemical achievement, a process for its production having recently been patented in Germany. It appears in crystals of a yellowish-white color and of a strong musk odor. For perfumery purposes the crystals should be dissolved in alcohol, with the addition of a trace of ammonia or carbonate of ammonia. This solution, which may be compared to tincture of musk, surpasses the latter in the intensity and penetrating power of its odor. The product to be used in perfumery must previously be diluted in a homoeopathic manner. The following are the rather loose details of the manufacture of the article, which have been deposited in the German Patent Office: "Boil in a reflux condenser toluol or toluene, C_6H_5 , with one of the following halogen compounds of butyl, viz., chloride, bromide, or iodide of butyl, along with chloride or bromide of aluminum. The resulting product falls back into the water in the still, where it is decomposed and distilled in a current of water vapor. The parts which distill between 170° and 200° are collected separately and treated with a mixture of nitric and fuming sulphuric acid. The product obtained from this process is washed in water and redistilled in alcohol, from which the 'artificial musk' crystallizes out." The patent rights for France and abroad have been disposed of to a syndicate of manufacturing perfumers. There is no doubt that the trade in natural musk, so far as the perfumery branch is concerned, is threatened with a very serious crisis. The use of musk in medicine is very restricted, the article being now only employed in certain cases of typhus. This may be regarded as another of the triumphs of synthetical chemistry.

A NEWLY DISCOVERED PROPERTY IN COTTON-SEED OIL.—According to the *Scientific American*, Philip Helbig and Hermann Bertling of Baltimore have discovered a new property of cotton-seed oil, which seems likely to extend its usefulness considerably. One gallon of pure cotton-seed oil being placed in a suitable iron vessel, 20 pounds of lead are melted and slowly poured into the oil, which at the same time is thoroughly stirred. The lead separates in globules, and when the oil is poured off, after cooling, there is found to be about 17 pounds only of the lead, the balance having been absorbed by the oil. The lead is again melted, and the operation repeated to the fifth pouring, the amount of lead absorbed being less at each succeeding pouring, but the total

amount absorbed being about ten pounds. The oil thus charged with the lead is then used as a paint, and applied in the ordinary way to metallic surfaces, which it is desired to protect from oxidation or corrosion. It is said to adhere closely and become very hard. Other metals are said to be similarly absorbed by cotton-seed oil, but it is not thought that any other oil possesses the same property.

SINGULAR ELECTRIC EFFECT.—A peculiar and instructive accident occurred recently at a fire in Lynn, Mass. The electric station took fire while the steam engine was running and driving a large dynamo which sustained the electric lights of that city. The wires were soon cut off, and the engine thus suddenly relieved of its work in keeping up a powerful electric current. The 700-horse power engine immediately commenced running wild, with such speed as to at once burst a large fly-wheel into pieces, doing much damage. This occurrence affords an excellent illustration of the principle of the transformation of energy. The power of the engine, instead of being transformed into electricity, was suddenly changed into centrifugal force which manifested itself in the wrecking of the fly-wheel.

AN ANTI-FRICTION SCREW NUT.—An anti-friction screw nut has been invented in which the bearing pressure falls on steel balls rolling in grooves in the nut and the threads of the screw. In the case of vertical screws, the balls "circulate" by falling from the top to the bottom of the nut and make regular "trips." Considering the abrasive wear in case of much pressure, and the complication, we think these may safely be set against the friction in a wall-made square thread nut of the common kind. Ball bearings are a questionable expedient in any case, so are roller bearings of all kinds, where there is any considerable pressure, and any complete obliteration of the whole system would be no loss in the mechanical arts, except for grindstones. —*Industry.*

TWO IMPORTANT LITERARY FINDS.—The *London Times* of Jan. 18th announces that the authorities of the British Museum have discovered among the collection of papyrus rolls acquired recently in Egypt the text of Aristotle's treatise on the constitution of Athens, from which numerous writers of antiquity have quoted, but which hitherto has been known only in detached fragments. The discovery is most unprecedented in the history of classical learning. The *Times* adds that there is no doubt of the genuineness of the manuscript. Another recent and important discovery is a poem of the sixteenth century, which treats of the same subject as Shakespeare's "King Lear." It has been published by the Academy of Sciences of Cracow.

CHEAPER ALUMINUM.—Mr. Eugene H. Owles, president of the Cowles Electric Smelting & Aluminum Co. of Lockport, N. Y., has stated to a reporter of the *Sun* that their new process of electric reduction of pure aluminum directly from the ore has reached such a stage as to enable them to produce metal, 98 per cent pure, at a cost of \$1.25 per pound. It is proposed to utilize the entire Lockport plant for the production of aluminum by the new process, and the capacity of the works is estimated at from one-half to three-fourths ton per day. The production of aluminum in alloys of iron and copper will be abandoned at these works.

CHAIN MOTORS IN MINES.—One of the latest motors designed for coal mines obviates the disadvantages of the excessive weight of the locomotive needed to gain sufficient friction on stiff inclines, by having a continuous chain gear. The chain is fixed at each end of the gallery, and passes around the sprocket-wheel of the electric motor on the locomotive, thus hauling the train of trucks along. This arrangement has been found far more practical in special cases than the simple locomotive for hauling. —*Electrical Engineer.*

CHEAP PIG IRON.—The *Manufacturers' Record* has in its possession a report made by one of the leading members of the British Iron & Steel Institute, an expert of the highest standing, on an iron property in the South, which, he says, is more valuable than the Cornwall property of Pennsylvania or any of the Lake Superior ore properties. This report says that the ore can be mined for 30 cents a ton, and that pig iron can be made at that point for \$7 a ton.

INFINITESIMAL MEASUREMENTS.—Prof. Rogers, it is said, has succeeded in measuring changes in length in a bar of metal caused by changes of temperature, to the millionth part of an inch. The experiments were carried on at Waterville, Me., in the laboratory of Colby University, and the principle employed was by the employment of light, the wave lengths of which were measured.

IODINE, hitherto known in nature only in combination with other elements, is now found in a free state in the water of Woodhall Spa, near Lincoln, Eng. The water is colored a decided brown by the iodine.

ORRIS ROOT, from which all violet perfumes are derived, is devoid of odor when dug, and has to be dried in order to develop its qualities.

USEFUL INFORMATION.

BURSTING OF GRINDSTONES.—The bursting of grindstones is so common an occurrence that it is a matter of surprise that no attempt has been made to learn the cause, and it is only recently that any one has ventured to express an opinion. The investigations of Mr. McNiece, proprietor of a saw factory in Philadelphia, after witnessing many accidents from the bursting of the grindstones, bring him to the conclusion that it is due to the square holes cut through the center, as every stone that he has seen which burst had a square hole, while none having round holes ever burst, and many stones that were worn down have been examined, and in all cases cracks were found in the corners. It is evident that the stone, working loose on the shaft, bounds more or less from side to side, and eventually the stone cracks from the repeated blows. The square hole is not a necessity, and buyers of grindstones should refuse to purchase any with other than a round hole through the center. The stone can be secured on a round shaft just as firmly as it can on a square one, by the use of a slide washer and keys. Many persons are injured every year by stones bursting, and if, as appears, the result is due to the use of square holes, it is little less than criminal to have such stones and ask men to work on them.

THE SEALSKIN BUFFALO. made by crossing polled Aberdeen cattle on the wild stock, is said to have a fine, glossy fur, as beautiful as that of the seal, and much thicker. The hump on the buffalo almost entirely disappears on this cross, and with it the shaggy mane for which buffaloes have always been noted. There are now twelve of these seal buffaloes, and the cross promises to become a successful and valuable breed. They lose their wild traits and become as easily domesticated as are our common cattle under like circumstances. The Hudson's Bay Fur Company is giving up business because furs are no longer to be had, and the sealskin buffalo, many of which show fur marked like a tiger, will doubtless become a valuable product in northern climes, where the winters are too cold for the common breeds of cattle to succeed. The above crossing will no doubt yield a greatly improved fur—if far it can be called—but it will probably be a long time before it is recognized as a "sealskin."

ONE CENT POSTAGE.—A contemporary says: A good deal is said of the advantages that would result to poor people by reducing letter postage to one cent. It appears to us that the advantage is more apparent than it would be real. The great bulk of letters that go through the mails are from business houses. While plain John Smith would perhaps save 50 cents a year, his employer might save \$200. It appears to us that, if the Government gets too much revenue from its postal service, it would be better to improve that service, charging two cents for carrying a letter, at least for some years to come.

ANCIENT CHINESE MINERS IN INDIA.—An interesting discovery has been made on the Harn-hall gold mine in the Mysore, says the *Indian Engineer*. While sinking the main shaft, the workmen broke into an old shaft, dug perhaps a thousand years or more ago. There were found mining implements of various kinds used by the ancient workers. It is supposed the workings were made by Chinese, of whose presence in Mysore there is unmistakable evidence. The tools found are said to be very like those used by the Chinese and unlike anything known to be used by Hindus.

EXPENSIVE DOG FLESH.—A Pittsburgh dispatch of Jan. 22d says that Count Nohle, the famous Eogliah setter, by Nora and Count Windom, is dead. His owner, B. F. Wilson, had several times been offered \$10,000 for him. The next most precious bit of dog flesh, which has recently been announced, is about leaving England for America. The noble animal is the St. Bernard, Sir Balvidere, sold by T. H. Green to E. B. Sears of Boston for \$6500. This dog has not as yet left a prize untaken.

A NEW "SPELLING."—The word "gauge," so much used in engineering and technical literature generally, will hereafter be spelled "gage" in the columns of this journal, following the authority of the Century Dictionary and the usage of the *Century Magazine*. We advise all our readers to go and do likewise.—*Engineering News*.

OLEIC ACID.—An acid which seems to have a peculiar solvent action upon the oxides, and yet leaves the metallic surfaces intact, is oleic, and when combined with finely powdered Venetian red and cleaning fluids, it leaves no trace of the desired in cleaning and polishing brass.

THE LARGE FISHING BANK recently discovered in the Pacific ocean, a short distance off shore from Point Loma, San Diego, is proving of great value. Some fine catches of whitefish and rock cod have recently been made there.

It requires about three seconds to transmit an electrical signal through the Atlantic cable.

Sweden has a machine that makes 1,000,000 boxes of matches daily.

ELECTRICITY.

Frictional Electricity.

The boy who desires to experiment a little in frictional electricity can obtain considerable experience and dead loads of fun, with so simple an electrical outfit as one chair, four tumblers, a smaller boy and a house cat. Place the tumblers on the ground, the chair-legs in the tumblers, set the boy on the chair and let him hold the cat. This part must not be omitted; it is the most important part of the whole experiment, and if the boy does not hold the cat he will be sure to come up to the scratch.

See that the hands are dry and clean; stroke the cat carefully from head toward tail, then remove the hands and apply again for another stroke, taking care not to rub the wrong way. After making a dozen strokes, a person applying the knuckles to either the boy or the cat will receive a smart discharge of electricity. The flesh of the boy acts somewhat like a Leyden jar, and high-pressure electricity is stored up to a considerable extent.

A sharp sound accompanies the discharge, which feels like the pricking of a pin, both where it strikes the hand and where it leaves body of boy or cat. When ready to terminate the experiment, make several elaborate passes over the cat, work up a powerful storage of electricity, then apply the knuckles suddenly to pussy's nose. The experiment terminates very suddenly at this point: Pussy decidedly objects to this part of the proceeding and the boy objects to further holding the cat.

ELECTRICITY IN VOTING AND COUNTING.—The plan of voting in assemblies by means of the electric current, and thus avoiding the time lost in making divisions, has been before the French Chamber of Deputies, and a report on the subject has been presented by M. Montaut. In that report the advisability is recommended of employing a machine which would indicate not only the total votes, the "ayes" and the "noes," but also the number of voluntary absentees from voting, as distinct from the number of absentees. Such an apparatus has been devised by M. Le Goazion. On every desk in front of a member is placed a small box fitted with two handles, which the member works when registering his vote. The right handle registers his "aye" and the left his "no," and both moved simultaneously indicate his absence from voting. The results are printed by means of electro-magnets in a receiver, and are visible at a glance. Provision is made for a member to recall and correct his vote during the time allowed for the purpose. An electrical device has also been in operation for some time in Washington, which was made in Austria and which is called a tabulating machine. It is used in the Census office, to aid in tabulating census statistics.

A MAGNETIC LIFT.—A party had on exhibition at the late Pittsburgh Exposition an electro-magnet designed for lifting pig iron from the pig bed in the cast house, which had a lifting capacity of 7200 pounds. In shape it somewhat resembled a bell with nearly vertical sides, standing about 20 inches in height, and measuring about 24 inches across the bottom. The thickness of the sides of the bell, if it may be termed such, is about three inches, and within the bell and being flush with it at the bottom was a large coil forming a powerful electro-magnet. The coil is made a magnet by the passage of a current of electricity through it. The magnet, which is attached to a crane, can be raised and lowered. The load can be dropped by simply shutting off the current.

THE WESTINGHOUSE ELECTRIC CAR.—The recently-introduced Westinghouse car, with its smooth and comparatively noiseless running, has created quite a favorable impression in electrical circles. The performance of these cars on the line lately installed, that at Greenburg, Penn., is a confirmation of the creditable record first made by them. In covering a distance of two and one-half miles the cars had to climb no less than eight hills, the majority of which had grades of 10 per cent. In addition to the hills the line had a large number of curves, all about ones, and two of a radius of 50 feet. In spite of these obstacles the operation of the car is reported as being easy and smooth and thoroughly satisfactory in every respect.

A CONVENIENT ATTACHMENT.—A brougham recently built by an English firm "adapts" electricity in rather an ingenious way. It is fitted with electric light sufficient for reading or writing. Opposite the seat is an ivory plate, on which are several buttons properly lettered: "Left," "Right," "Stop," "Go On," "Home," and so on. On the dashboard, in the coachman's view, is a case lettered to correspond, so that when a knob is pressed he understands at once what is expected of him. One button brings out the word "Speak," in which case he will put the speaking-tube in position and receive orders.

TRAINS MOVED BY ELECTRICITY. running under the Thames and connecting parts of London—moving at a speed of 25 miles an hour—rather puts us to shame in the matter of rapid transit. Yet we laugh at the slowness of our English friends in adopting the use of electricity.

SHOP NOTES.

How to Use Glue.

All the glue as received from the factory requires the addition of water before it will melt properly, and every addition of water (while the glue is fresh made) will, up to a certain point, increase the adhesiveness and elasticity, and it is the duty of every man who uses glue to find out just where the point lies, as it is possible to melt glue and have it so thick that after it is dry, or set, it will be so brittle as not to adhere to the wood. Some glue will bear more water than others, but all will bear more than usually falls to their share, and that, too, with a greater increase in the quality of the work. For glue to be properly effective it should penetrate the pores of the wood, and the more a body of glue penetrates the wood, the more substantial the joint will remain. Glue that takes the longest to dry is to be preferred to that which dries quickly, the slow-drying glues being always the strongest, other things being equal. For general use no method gives such good results as the following: Break the glue up small, put into an iron kettle, cover the glue with water and allow it to soak 12 hours; after soaking, boil until done. Then pour it into an air-tight box; leave the cover off until cold, then cover up tight. As glue is required, cut a portion and melt in the usual way. Expose no more of the made glue to the atmosphere for any length of time than is necessary, as the atmosphere is very destructive to made glue. Never heat made glue in a pot that is subjected to the direct heat of the fire or lamp. All such methods of heating glue cannot be condemned in terms too severe. Do not use thick glue for joints or veneering. In all cases work it well into the wood in a similar manner to what painters do with paint. Glue both surfaces of your work, excepting in case of veneering. Never glue upon hot wood or use hot coals to veneer with, as the hot wood will absorb all the water in the glue too suddenly and leave only a very little residue, with no adhesive power in it.

HARDENING IRON.—Oil hardening seems to be one of the best ways of handling heavy work. The tank into which hot gun steel is plunged contains 1200 barrels of oil. When the oil takes fire, shut down the cover just as you would a tank on a small scale. Experiments are being made in hardening heavy work by a process that is made use of in France. A metallic liquid is used that will absorb the heat at a great rate without generating steam or vapor to keep it from coming in contact with the steel, or giving off fumes that are poisonous. Among the old suggestions that were offered a hundred years ago, in regard to hardening steel, was one which said: "Heat your steel and plunge it into wine into which the root of blue lilies has been soaked, and it will be made very hard. If bean water is used instead, it will be made as soft as lead."

SHOP HANDS.—A shop where all hands seemed to regard each other as men would be an interesting place to visit, but we do not expect to find anything of its kind this side of the next world. If a man gets hurt and is laid up for three months, the boy will take right hold and patch up a goodly sum to help him along, but if he cuts off a finger or smashes his thumb, they will all take a look at it and go back to work saying, "good enough for him, always into something that didn't concern him," "can't mind his business, and had to fool around that saw," or "served the cuss his lesson that time; guess the boss won't run on to my job again." And all hands settle down to making life unpleasant for some other poor chap who would gladly meet half-way in good-fellowship his comrade toilers.

HARD AND SOFT EMERY WHEELS.—Hard, close-grained emery wheels do not cut so rapidly as soft, loose ones, from the fact that the particles in the hard stone are more compact, and the edges wear slightly before breaking, while in the soft wheel the cement wears first, and more rapidly, presenting new cutting edges to the work, which, when but slightly worn, will pull out of the wheel on account of this increased friction surface, fresh, sharp edges replacing them. This is proved by the fact that the fastest-cutting wheels are the softest.

A NEW METHOD OF DEVELOPING MINES.—The Industrial Mining Co. has been incorporated with headquarters at Jackson. The directors are William Moon, Joseph Moon, James Moon, George McConnell, W. E. Lawrence, W. H. Griswold, and Richard Moon. It proposes to develop the mines of Amador county on the co-operative plan. The value of shares is \$12 each, \$1 payable on the issuance of certificate of stock, and the balance in monthly installments of one dollar. When the full price is paid the holder of the paid-up stock becomes a member during the life of the incorporation, and is not liable for any further payments. Only a limited number of shares can be held by one party. The money is to be used for labor in developing the mines, and members are to have the preference as employees. The plan is being canvassed in Chicago and other places, and encouraging reports of the prospects of placing a large block of the stock in the Eastern money centers are being received.—*Amador Ledger*.

STEAM BOILER NOTES.

The Serve Ribbed Boiler Tube.

The *Engineer*, of New York, has this to say about the Serve ribbed boiler tube that has recently been tested in England:

"The Serve boiler tube, so called from its inventor, has ribs projecting internally for its entire length, and it is intended to increase the evaporating power of the boiler by augmenting the internal surface exposed, and its conductivity. This seems fallacious, for the capacity of the tube is bounded by its external surface and it can give no more than can be radiated by a given surface in a given time. Otherwise such tubes are objectionable, by reason of the impossibility of cleaning them, and by cinders or small coal getting between the ribs and choking the tubes."

Commenting on the above, the *Boston Journal of Commerce* says:

We would like to inquire how much radiation from tubes has to do with making steam in a boiler? How much a tube will radiate has little to do with the matter. Water in a boiler is heated by convection and the heat given it by radiation from the tubes isn't worth considering, so the capacity of a boiler tube is not bounded by the amount of radiation. Nor is the idea of the Serve tube fallacious, for the water being heated by convection, it is the internal surface exposed and the conductivity of the metal that is to be considered. The external surface of the tube will give more heat to the water where the tubes project, simply because its internal surface gives it more heat. So long as the ribs keep the same temperature as the water, the water is taking the heat. With steel ribs this will be for a less distance than with copper, for instance, that would conduct heat to the external surface more rapidly. Any one can see a demonstration of the truth of this by watching the water boil in a kettle with short projections upon its bottom to rest upon. The water will boil first over these projections and continue to boil there after it has ceased everywhere else in the pot.

THE FUTURE OF THE STEAM ENGINE.—Is a recent issue of the *North American Review*, Prof. R. H. Thurston, of Cornell University, an authority on the subject of steam engines, expresses it as his opinion that this invention is capable of vast improvement, and that it has not yet begun to exhaust its inherent powers. On the basis of greater developments in the application of inventions to the steam engine, Professor Thurston predicts that the next generation will see it consuming one pound of fuel per hour for a single horse-power; that ships of 20,000 tons will be driven at the rate of 40 miles per hour; that the American continent can be spanned by flying trains in two days, and that transportation between the cities of the Atlantic and those of Pacific coasts will be so cheap that the general average of living will be vastly improved upon what exists today.

STEAM ENGINEERING.—One of our contemporaries rightly observes that radical changes in the science of steam engineering have not been numerous in the last quarter of a century, but improvements in the details of construction and operation have been many and of high utility. How important this progress has been in its economical results is indicated by a statement recently made that railway trains in England are now driven at an average speed of 14 per cent higher than 20 years ago, with a little more than half the quantity of coal.

HEATING SURFACES.—It has been found by experiment that nothing is gained by having a higher ratio than 36 to 1 of heating to grate surface. Up to a ratio of 45 to 1 there is no appreciable loss but no gain, and above this there is a clear loss.

Golden Fruit from a Golden Soil.

Smartsville, Yuba county, sent 25,000 oranges as its contribution to the exhibits of the Northern Citrus Fair at Marysville, and carried off several prizes. This old mining camp, which has yet a great store of gold to be taken from its gravel channels, is also capable of competing, by its golden fruit grown on the surface of the mines, with famous orange-growing districts of Southern California.

The old idea that mines of gold and silver were only found in regions fit for nothing else, was exploded when we began to realize the capabilities of the soil of this Golden State. It is true that most mining regions are not attractive in their surroundings, and few are fruitful in sight but mineral wealth. But in the gold-producing counties of this State the miner can be farmer, and the farmer miner as well. The surface of the soil may be cultivated for fruit and cereals, and under the golden grain may be found. In numerous places both mining and farming are carried on upon the same "claim" or ranch.

Smartsville was one of the famous hydraulic mining camps, but its glories departed when that branch of mining was stopped by the courts. There are many acres of auriferous gravel still unworked in its vicinity, and in due time, when a plan is devised to permit these deposits to be again worked, the old camp will see a revival. Meantime the fruit-growers are busy in their vocation, and the auriferous soil returns a golden yield in another form.

Passing Events.

The announcement that deep mining will again be resumed along the whole line of the Comstock lode will be received with gratification by all who have abiding faith in the riches of that wonderful vein. The lower levels have been abandoned for five years, but they will now be drained and men set at work prospecting for ore bodies. Active operations will be commenced at once, and all the pumps set at work. Some hundreds of additional men will find employment on the Comstock as soon as the lower levels become accessible.

It looks now as if San Francisco alone will be unable to do as it pleases in the matter of electric roads. The cities of the second and third class will doubtless be permitted by the Legislature to have overhead-wire railroads if they wish them, but it seems San Francisco will not unless the representatives at Sacramento change their minds by Monday next.

Considerable prospecting for coal is now going on all over the coast. The scarcity of good coal in California is greatly to be regretted, but even that of inferior quality pays very well for local consumption, so that the owner of a coal mine generally has a good thing of it.

Deep Mining on the Comstock.

About five years ago the lower levels of the Comstock mines were abandoned and allowed to fill with water, but it is realized now that this never should have been done. The men who control the south end and Gold Hill mines began to drain the lower levels of their claims some months ago through the Crown Point incline. Now the men who control the middle and north end mines have decided also to do some deep mining again themselves.

This announcement has been hailed with joy on the Comstock, for it means renewed life to that famous mining region. The great Combination shaft, owned by the Chollar, Potosi, Savage and Hale and Norcross Mining Companies, was the last of the deep shafts on the Comstock to shut down when deep mining was abandoned. It was shut down early in 1886, and great gloom immediately fell upon Virginia City and Gold Hill, and upon the mining and stock interests generally. Thousands of men were thrown out of employment and the stock market fell to very low prices. Mr. Alonzo Hayward, one of the mining magnates who control the middle and north end mines, says: "The first step we shall take will be to start Cornish pumps in the Combination shaft and lower the water until we can recover the hydraulic dumps and set them going. This will drain the lower levels of all the middle mines, and also help drain the Gold Hill and north end mines. When this work has got well under way you may learn that the pumps at the C. & O. shaft are to be started. We have, in fact, a plan for the drainage of the whole lode and are going to carry it out. We are encouraged in this matter by recent discoveries of ore which have been made in the mines."

This means a resumption of deep mining along the whole lode, and will result in the employment of many more men. When the hydraulic pumps in the Combination shaft are reached, they will be set at work, and then the pumps at the C. and O. shaft will be started up. When the lower levels become accessible, prospecting operations will at once commence. It is probable that expenses will be reduced in other directions so as to prosecute the deep mining. There are thousands who have faith in rich ore in the lower levels, and who have never abandoned that faith even while work was stopped. The old Comstock has seen hard times in the past few years, but may again retrieve itself. There are 49 different mining corporations on the Comstock, and since their incorporation the combined number have levied assessments to the amount of \$77,920,385, and have declared dividends to the amount of \$120,558,780, leaving a balance in favor of the mines of \$42,638,395 over and above the assessments. Over \$520,000,000 of gold and silver has been taken out of the Comstock in the last 30 years.

Copper.

The California product of copper amounted last year to about 2,000,000 pounds, a quantity that it is calculated will be more than doubled the present year. The only mine in the State that is making any considerable output of this metal is the Union, at Copperopolis, lately restored to a productive condition, and which is now being actively and profitably worked.

"The value of copper during this year will depend mainly upon the extent of the supplies received from the United States." So say James Lewis & Sons of Liverpool, the authorities on copper statistics, proving that the United States, and not Chile, control the copper market. No reason is seen why the consumption of copper during 1891 should be less than in 1890. In fact, it appears likely to prove greater with the constantly increasing use of electricity for lighting, motive-power, telephonic and telegraphic purposes, a probable increased consumption of sulphate of copper, and an improved demand from India. It is thought that about 50,000 tons more copper will be required in England and France during 1891.

Last year the increased production from the United States was 17,000 tons of copper, 6000 from Lake Superior, 1600 from Arizona, 8000 from Montana and 400 from other States, but the consumption increased 20,000 tons. Allowing, therefore, for an increased consumption in the United States, chiefly in the form of copper for electrical purposes (especially for motive-power, railways, etc.), there seems but

little probability of sufficient copper coming from this country to provide for the estimated foreign deficiency of 40,000 tons, and maintain English and French stocks at their normal level of 50,000 tons.

The statistics of 1890 show a decreased import into England and France, and English production, as compared with 1889, of 1069 tons, and an increased consumption in, and exports from, England and France of 28,864 tons. English consumption shows an increase of only 411 tons, but the exports from England an increase of 14,120 tons, of which 11,063 tons were of English copper to France, while French consumption has increased to the great extent of 25,396 tons. Whereas the imports from the United States to England and France show a decrease of nearly 10,000 tons, that from Japan shows an increase of 8,000 tons, and from Spain and Portugal 1500 tons. From the Cape there is a decrease of 1500 tons, and from Quebrada an increase of 1000 tons. With these exceptions, there has been but little change in the quantities received from the different countries.

It is estimated that the increased production of sulphate of copper absorbed fully 15,000 tons more copper in 1890 than in 1889. The total copper production of the world for 1890 is estimated at 282,000 tons, against 265,000 in 1889 and 260,000 tons in 1888.

Borax.

The quantity of this salt manufactured on the Pacific Coast last year—all in California and Nevada—amounted to 6000 short tons (12,000,000 pounds). The borax industry, which for many years suffered severely by reason of excessive local competition, has, for the past year or two, proved more remunerative; the several producing companies having come to work more in harmony. As a result the market has been kept at paying prices, which may be quoted at seven cents per pound for concentrated and eight cents per pound for powdered and refined, these being wholesale rates.

California and Nevada are the only States which produce this salt, and they are also the only counties on the western continent that produce it to any considerable quantity. The beds have been worked for about 30 years, and at one time the business was so overdone as to bring disaster to the investors. The remoteness and desert character of the region where the ore material occurs and where its manufacture is carried on, cause the work to be carried on at somewhat heavy expense.

For some years there has not been much profit in the fields owing to depression in prices. At one time, years ago, borax was sold for 35 cents a pound, and now it is even cents. In May, 1887, it was down to five cents, and in 1886 even lower than that. Competition with the foreign article, and competition between themselves, caused the companies to lose money.

Affairs are better now, however, and there is an increase of production shown. Back in 1879 the production was only 1,500,000 pounds; in 1886 it was 9,778,290 pounds, and the past year about 12,000,000 pounds.

JOHN KELLY, the well-known mining superintendent and stock operator, died of consumption in this city on Thursday. He was originally a miner in the early days of the Comstock, and made quite a fortune in the palmy days of Crown Point and Belcher. This he lost and went to work in the Belcher again, but subsequently retrieved his fortunes. He was at one time superintendent of the Lady Bryan. Of late he has been at Bodie, and was for some time superintendent of the Bodie Con. Mono and Bulwer Con. mine. He is reported to have left an ample fortune for his wife and two children.

THE Mechanics' Institute Nominating Committee have reported the names of Irwin O. Stamp, George E. Dorr, Samuel J. Hendy, Oscar Lewis, M. A. Dorn and Andrew Wilkie for presentation to the members at the next election of directors.

WORK has been commenced on the new electric road of the San Francisco Syndicate and Trust Co. This will be the first electric road in San Francisco, and will be two and one-half miles long.

THE owners of a mine on White river, Tulare county, crushed 12 tons of rock last week, and got \$1000 worth of gold.

The Bear Valley Dam.

(Continued from Last Week)

The new dam will be 15 feet thick on top at the water-line, and will carry a heavy wall acting as a wave parapet on the upper edge, and a heavy iron railing on the lower edge, and between these there will be a wagon-road. The back of the dam, or the side next the water, will be vertical from top to bottom, and the face, or lower side, will be built in the form of steps or terraces. These steps will have a uniform raise of ten feet, and each one will have an offset proportioned to the depth of the water above it, and just sufficient to prevent any tensile strains in the masonry when the reservoir is full of water.

The copy of the strain-sheet which is here presented (Fig. 3) shows the exact dimensions of the dam from the water-line down to the level of the datum plane, and it also shows the direction, theoretical point of application, intensity and resultant of all the forces acting on the dam, and shows the maximum strain in the whole structure when the reservoir is level full of water to be less than 12 tons per square foot. It also shows that the average pressure on the whole base will be less than six tons per square foot, and that there will be no tensile strains in any part of the dam.

Fig. 4 shows the ground plan and the cross-section of the dam taken through the middle of the gate-well. As will be seen from this cut, the gate-well is a cylindrical chamber extending from the top of the dam to a point a little below the level of the datum plane. It will be built into the back of the dam, as shown on the ground plan, and will be 18 feet in diameter inside. It will have three inlets at the bottom, four more 40 feet higher, and three more 40 feet higher still, or 80 feet from the bottom. The outlets will consist of three cast-iron pipes, 36 inches in diameter, laid on parallel lines and extending from the gate well out through the body of the dam. The inner ends of these pipes will be closed by massive gates worked by screws and rods extending up to the top of the dam, and operated in a gate-house which will cover the mouth of the well. These three outlet pipes will be capable of discharging about 75,000 miner's inches of water.

Fig. 1 is an enlarged plan of the well and outlet and inlet pipes, and Fig. 2 is a cross-section through the bottom of the well, showing the gates and lower inlet pipes; as will be seen, these inlet pipes are elbows with their mouths turned upward. The mouths of these pipes will be fitted with bronze rings to prevent corrosion, and whenever it becomes necessary to repair the main gates the inlets will be closed with cast-iron caps having gaskets under them, and the well will then be drained. Workmen can then go down and repair or remove the gates without difficulty.

The caps will be lowered by chains, as shown in Fig. 2, and will be provided with guides to steer them into position. When not in use they will be hauled up and stored in the gate-house. When the inlets are once capped and the well drained the pressure on the caps will be so great that no ordinary appliance would lift them off again until the well is filled; for instance, when the reservoir is full and the well empty it would take a twenty-four ton lift to raise the cap from one of the lower openings. To obviate this difficulty each cap is provided with an auxiliary valve, to which the lifting chain is attached. The first effort to remove the caps will open these valves and allow the well to fill with water, after which the caps will come off easily. Fig. 2 shows one of the caps suspended by its chain over the opening.

The dam will be 80 feet through at the bottom, and built of solid granite masonry laid in Portland cement mortar. It will be built on the solid rock, and the foundations will be out in steps, as shown in Fig. 2, so as to give the masonry the best possible hold on the rock and avoid any long-continued seams in any direction. The tops of the steps on the outer face will be finished with a cut granite coping 18 inches thick. These coping stones will average about 5 by 7 feet on top, and will be laid with close joints not exceeding $\frac{1}{4}$ inch apart, and they will be joined together with cast-iron dowels having swelled heads.

After the stones are placed in position, the holes in which the dowels are set will be filled with melted sulphur, so that no stone can be removed without breaking it in pieces. Great

care will be exercised in selecting these coping stones, and only the choice stones of the whole quarry will be used for this purpose.

The dam will be built in the form of a curve or horizontal arch, with the convex side upstream, as shown in Fig. 4. The crooked lines in the figure are contour lines joining all points of equal height, and their relative altitudes are given in figures. A little study of these lines will show that the dam can be built on this

they will be equipped with a full complement of air-drills and bolting and loading rigs. The quarries will be connected with the dam by railways carrying cars propelled by electric motors. At the dam the rocks and other materials will be handled by a new system of hoisting apparatus.

This will consist of four large steel cables spanning the gulch like the main cables to a suspension bridge. These cables will be drawn

across the canyon the whole length of the main cable. Two winding-drums will be required for each trolley—one to raise the load and one to move it along the cable.

These four rigs will each be capable of raising and moving a block of stone weighing ten tons, at a speed of 45 feet per

Fig. 1—PLAN OF GATE WELL.

site, with the curvature shown, with less material than it could if it were built straight or with any other curvature. The curved form will add greatly to the resisting power of the dam, especially during an earthquake. It is believed that when the dam is constructed as proposed, and the reservoir is full of water, it will be in a much better condition to safely resist a heavy earthquake shock than will any large building in California, and that it will be fully equal in security to any similar structure in the world.

Quarries will be opened on either side of the canyon within one-fourth mile of the dam, and

up tight and parallel, and so spaced as to cover the entire work. The cables will hang free from end to end, and each one will carry a small car or trolley, which will be free to roll along the cable from one side of the canyon to the other.

These trolleys will be rigged with hoisting pulleys under the main cable and a double block running to the load to be moved. These pulleys will be so strung that the load can be picked up to any desired height, the brake of the hoisting-drum set, and then the trolley, carrying its load with it, without either raising or lowering, will be free to move back and forth

minute, and can pick it up from any part of the work and set it down vertically over any other part.

They will be set up high enough at first to build the dam to 80 feet; by that time they will be worn, and will then be replaced with new ones high enough up to finish the work.

By this arrangement the slow-going derricks will be dispensed with, and there will be no gnysnor beams swinging round in the way to obstruct the work; and there will be no moving of derricks with its attendant delay and danger.

The tracks from the quarries will run under the main

Fig. 2—SECTION THROUGH LOWER INLET.

Fig. 3—SECTION OF DAM, SHOWING STRAINS AND DIMENSIONS.

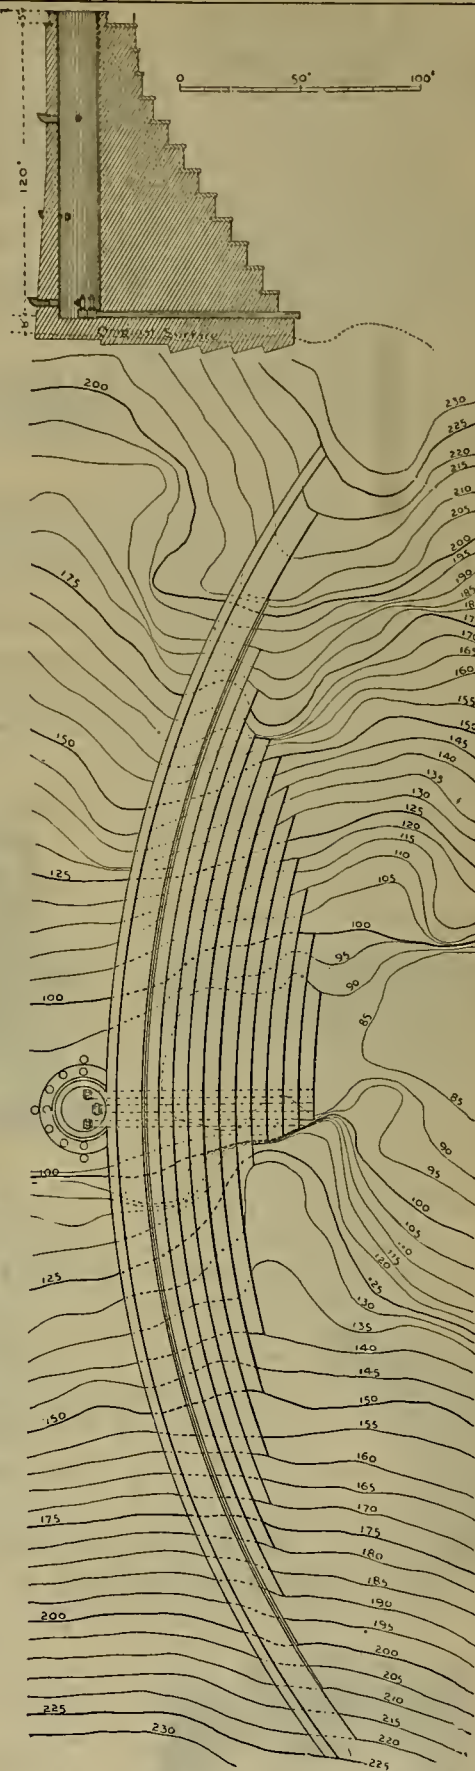

Fig. 4—PLAN AND SECTION OF NEW DAM.

cables, so that heavy rocks may be taken by the trolleys direct from the cars to their permanent position in the dam.

The mortar and concrete will be mixed by a rotating machine located under one of the main cables. This machine will discharge into iron kishies, and these will be lifted by the trolleys and conveyed directly to the mason's hand.

The cement, sand, broken stone and gravel will be stored in bins discharging into a hopper above the mixing machine. The hopper will be kept charged with the various materials in the right proportion. When a batch of cement is required, the hopper will be emptied into the mixer; the right quantity of water will be admitted, the machine will mix and empty its charge, and in from four to six minutes from the time the order was given the trolley will have a batch of fresh concrete at the mason's elbow.

(To be Continued.)

DAVIS'S Bricks, Tile, and Terra Cotta

RECENTLY PUBLISHED.
A NEW EDITION.

A PRACTICAL TREATISE ON THE MANUFACTURE OF BRICKS, TILES, TERRA-COTTA, ETC., including Hand-Made, Dry Clay, Tempered Clay, Soft Mud, and Stiff Clay Bricks, also Front, Hand Pressed, Steam Pressed, Re-Pressed, Ornamentally Shaped and Enamelled Bricks, Drain Tiles, Straight and Curved Sewer and Water Pipes, Fire Bricks, Fire Bricks, Glass Pots, Terra-Cotta, Roofing Tiles, Flooring Tiles, Art Tiles, Mosaic Plates, and Imitation of Marble or Inlaid Surfaces, embracing every important product of Clay employed in Architecture, Engineering, the Blast Furnace, for Refractories, etc., with a History and the Actual Processes in Handling, Disintegrating, Tempering and Molding the Clay into the Shape, Drying Naturally and Artificially, Setting, Burning with Coal, Natural Gas and Crude Oil Fuels, Enameling in Polychrome Colors, Composition and Application of Glazes, etc., including Full Detailed Descriptions of the Most Modern Machines, Tools, Kilns, and Kiln Roofs used. By Charles Thomas Davis. Second Edition. Thoroughly Revised. Illustrated by 217 engravings, 501 pages, 8vo.

Price \$5.00, by mail, free of postage to any address in the world.

CONTENTS.—CHAPTER I. The History of Bricks. II. General Remarks concerning Bricks, their Size, Strength, and other qualities. Ornamental Bricks, Architectural Terra-Cotta, Blue Bricks, Salt-petre Exudations upon Brick Work. III. Enameling, Glazing, and Ornamenting Bricks and Tiles, Earthenware, etc. IV. Selecting Clays for Various Kinds of Bricks—The Different Varieties of Clay—The Characteristics, Qualities and Localities—How to Color Bricks Red—Kaolin Terra-Cotta Clays—Fire Clays—Exporting, Digging and Marketing Fire Clays—Washing Clays—V. Making and Burning a Kiln of Hand-Made Bricks. VI. Manufacture of Dry Clay Bricks. VII. The Manufacture of Tempered Clay Bricks, including a description of the most modern Machinery Employed. VIII. Kilns. IX. The Manufacture of Pressed and Ornamental Bricks. X. The Manufacture of Fire Bricks. XI. The Manufacture of Drain Tiles. XII. The Manufacture of Sewer Pipes. XIII. The Manufacture of Roofing Tiles. XIV. The Manufacture of Architectural Terra-Cotta. XV. Ornamental Tiles, etc. Index.

A circular of 6 pages quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish his address.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER GRES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, culminating illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S L'WACHING GOLD AND SILVER GRES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & CO., S. F.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metal-lurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy. Price, \$3.00 post-paid. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E. The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1888.

CAPACITY, 12 Tons in 24 Hours. 2 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturer cordially invite miners to critically examine and pass judgment upon this improved system of rolling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The height to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), London, October 5, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly,
THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.
ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented Belt) - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN:—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.
At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.
(Signed) Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

NOTICE TO GOLD MINERS!
SILVER-PLATED AMALGAMATED PLATES
For SAVING GOLD!
IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER
AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

"Sensible" Horse Power Hoisting Whims.

These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

A Smelting Plant.

We illustrate herewith a complete smelting plant of 100 tons' daily capacity, embodying all the details of first-class smelting works, as employed for large mines or custom work. Two large water-jacket furnaces with telescope stacks, are employed; the dust and fumes pass into a stone or brick condensing flue through connections under the charging floor. One large Baker blower is used (driven from the engine-shaft direct) which supplies the blast for both furnaces.

A large Blake crusher, situated above the charging floor, crushes the ore and fluxes as well as the matte and slag which is found necessary to be again passed through the furnaces. The slag and matte are raised to the crusher floor by means of a self-dumping skit (traveling on the incline shown in the center of the cut) extending to the top of the crusher floor, and is operated by a small friction hoist, treated on the charging floor end to the left of the incline ways. An elevator is also provided for the purpose of gaining access to the charging floor, or transferring barrels, tools, product, etc., from one floor to another. This is shown in the cut to the right of the first furnace, near the engine. On the main or charging floor will be seen the scales used in weighing the ore, fluxes and fuel before being charged into the furnaces.

The entire plant is driven by one large automatic cut-off engine, the steam for which is supplied by two boilers. These boilers are set independently, each being of sufficient capacity to run the engine; it is considered best to have one in reserve, as in case of accident to steam connections, cleaning or repairs, no time is lost by stoppage of furnaces.

A water-supply tank is situated in the rear of the engine-room, as shown, from which the water is supplied to the jackets. In a separate

PAVANT BUTTE, LAKE BONNEVILLE REGION, FROM THE SOUTH.—See page 105.

COMPLETE WORKING PLANT WITH PACIFIC WATER JACKET SMELTERS.

building at the side of the works will be observed the long roasting furnaces in which rebellious ores, or such as contain large quantities of sulphur, zinc, antimony, etc., undergo a preliminary roasting before going to the smelters. The method of arrangement here shown is not arbitrary, as the ground selected for the site often requires changes. This arrangement of plant is one designed by the Pacific Iron Works of this city, but they can arrange differently to meet the requirements of any site.

The Pacific water-jacket smelter for lead ores, made by the same firm and used in this smelting plant, is illustrated on page 105. It is a pattern in general use in the large custom smelting works in the United States. It embraces all the valuable features that 20 years' experience in smelting can suggest, and is entitled to be considered one of the most improved types of smelters made.

The jackets are made of the best fire-box flange iron, in four sections, and are constructed in such a manner that no rivets are exposed to the fire. The tuyeres are made a part of the jacket and surrounded by water in active circulation. Hand-holes are provided for removing any sediment that may collect, and are furnished with plates and crabs.

(Continued on page 105.)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

American Enterprises and English Capital.

EDITORS PRESS:—An editorial in the London *Financial News* of December 23d last, on a certain packing concern, is likely to be read with considerable interest among promoting men. I do not wish to say anything for or against the enterprise in question, as I know little of its affairs, but rather the inference drawn that investors should beware of American industries. Now the plain truth of the matter is, English investors are all right and American industries are all right. The trouble is the two do not always come together, and for this, I think, parties on the other side are to blame rather than people here. English promoters are too difficult to deal with; they hedge themselves about with a perfect jungle of impossible conditions; they must have bonds and options; they must have oceans of time; they must be privileged to take up a thing and drop it 20 times more if it suits them, and the American owner must preserve his temper unruffled all the while and he always ready to both up with the serene and most complacent of smiles. What is the result? The owners of first-class American properties refuse to deal on such a basis, and promoters and others are relegated to inferior enterprises that are generally itching to be sold out to somebody; and this is the reason I may say so much valueless stuff from all over the world is dumped into England. When the owner of a great industry here is approached on behalf of Englishmen, he generally laughs at the idea of selling; gradually he may yield to the insinuating allurements of the agent. He takes the letter through his establishment and shows him all that is to be seen; is very free and lavish, in fact, on all points necessary to convey a comprehensive idea of the business. The agent is able to write home the extent of the works, the number of hands employed, the price, the approximate profits—enough, in one word, to enable any one with sense enough to seek shelter in a rainstorm, whether such a property would be desirable or not. Generally he receives no such answer, but is contently informed the matter cannot be entertained in any such shape, and they (the principals) will pay no attention to anything that is not first firmly secured by bond, option or contract of some kind. The agent returns to the owner and explains matters; but the latter has his own way of doing business, and demands that a certain sum be put up as a guarantee of good faith before he opens a book or makes a statement. He argues very truly the London promoter runs no risk, as in case the showing is not found satisfactory or up to requirements previously stipulated, the deposit money is to be returned to him. Beyond this, the owner, independent and probably far richer than his London correspondent, cannot be budged, and the consequence is the negotiations end in smoke; and the agent, after several such experiences, is finally forced to take up some shaky institution which is only too willing to dance attendance on the whims and vagaries of London promoters for the pleasure of being foisted at last on the market. This I am convinced is the root of the evil complained of, and unless promoters are willing to put up something to get hold of a property that is notoriously good, or one on which they have been reasonably informed, they will continue to be imposed on by things that inevitably wind up by bringing disaster on the public and discredit on themselves.

VESPUCIUS.

San Francisco, Feb. 7, 1891.

Digging Out Gophers.

EDITORS PRESS:—To many who are not fully familiar with the habits of the gopher tribe, I would offer the suggestion that no better time than the present is fitted for exterminating them.

There are many ways for disposing of them; with myself after considerable experimenting the cheapest and quickest way to my notion is to dig them out of the soil.

This may seem to many people to be a hard and tedious way of eradicating the gopher, but if once tried it will be found a quick, pleasant and positive way for getting rid of them.

The gopher does not bury deep in the soil as many people suppose, but follows along from 4 to 15 inches below the surface, seldom exceeding 12 inches, unless in near proximity to their domicile.

The gopher builds for itself a home in such a way that if once in the seclusion of its nest it is safe from all water influences, building as it does near to the surface of the ground, and covering its nest carefully with sticks laid in such a way that a thorough drainage is assured.

Always does the gopher dig down into the earth to the depth of 15 or more inches for a full drainage of all water that would fall naturally—the earth below absorbing the water.

My plan in digging the gopher out is to follow the hole till two holes are found running in opposite directions. At this point leave the first and look for a second gopher home; do the same with this one, and

so continue till the rodent of the first hole has dumped more earth. This will show in which direction it is working, and by carefully following on this plan extinction is assured.

In and near the month of March is the gophers' breeding-time, and from one to a dozen of these pests may be found in a single hole.

S. H. RENO.

Fruit Vale, Alameda Co., Feb. 2, '91.

Notes from Sonora.

EDITORS PRESS:—The company of which I wrote in my last communication as working at the Sierrita, near this place, has recently purchased in the Altir district a five-stamp mill, which they have taken down and are now removing to its new location near the mines. It is to be erected on the old millsite occupied by Magruder & Fisher's mill several years ago. I understand that from these mines, during the past 14 months, nearly \$100,000 worth of ore has been shipped and a large dump of good average-grade milling ore is ready for the mill.

Mr. Henry Martin of London, England, a gentleman largely interested in mining properties in this State, has been here since early in December last looking after his interests, and it is reported that he is about to bring out some new companies in London on his return.

There is talk of a smelter to be erected near here by San Francisco people, and it is hoped that the project will be carried out. There is room here without doubt, and a very profitable business can be built up very quickly. The McKinley bill has prohibited the sale in the United States of the lead ores of this country, and in other States the erection of reduction works for custom ores is well advanced, notably so along the Mexican Central R. R., where others are proposed.

About 20 miles east of Querobabi Station, on Sonora R. R., is a mine and mill situated at a high altitude. The mine is old and has been much worked by Mexicans. The ore is silver and much of it rich and adapted for shipping. The mill is five-stamps and was largely brought from Sierroque, on the Sonora river, by its owners, Riordou, Frederick and Shea, who formerly worked the San Augustine mine near that place. The San Augustine mines were originally called Las Guijas, and, singularly enough, its owners, after working it out, moved to another Las Guijas, the old name of the present property. The working average of their ore is said to be in the neighborhood of \$100 per ton. It has to be roasted before amalgamation, after which process a very small percentage is left in the tailings.

The St. Helena mill, at Delicias, has not yet started, I am told, but will very soon.

The Oro Negro Company, near Arizona, is said to be very successful. It is under the control of Messrs. Gage, Darke & Kirk of Tombstone fame. Their consumption of salt in roasting is heavy and furnishes transportation work to a vast number of burro owners and freight wagons.

The Nicosari country in which this property is situated is a good country for prospectors. Formerly the Apache was the almost sole occupant. A mine of very great fame and antiquity is some 30 miles east of Oro Negro; its name is Churrunhabí, and is now being worked by Mr. P. W. Smith and several others. Mr. Smith is a man well known in Tombstone, and in fact all over Arizona, Mexico and the frontier as one of the pioneers.

Freight business is increasing rapidly on the Sonora railroad. Oranges and ore are going out and machinery and goods are coming back to the country. From this date to May the climate is fine, and those who desire to look at mines can find no better time in the year to visit Sonora. Already there are many experts and capitalists coming, and if free coinage of silver takes place, there is bound to be a boom in mining here.

"AMERICANO."

Hermosillo, Mexico, Jan. 27, 1891.

A RICH SILVER STRIKE.—Last week we referred to a rumor that a rich strike had been made by A. P. Sayre, in one of his mines in the Patterson District, about eight miles north of Bridgeport. We are glad at being able to say that this week the report has been confirmed, Mr. Sayre having made a rich strike in his Homestake tunnel, which he has been running from Silverado canyon. All who have visited the Homestake agree as to its being a rich strike, there being at last accounts from the mine at least three feet of rich silver ore in sight. W. A. Irwin, late superintendent of the Bodie Con., laid over at Sweetwater, on his way to San Francisco, and examined the new strike, which he considers a valuable one, and he is still there watching the prospect. This is an encouraging strike, as it shows a permanent ledge, Sayre having previously taken out good ore in the upper workings, and will strengthen the faith our people have in the "coming out" of the Patterson District.

—Bridgeport Chronicle Union.

THE MINER'S HOSPITAL.—Hunewell has introduced a bill asking for an appropriation of \$100,000 to purchase a site and erect buildings for a State Asylum and hospital for indigent and aged miners. This is a bedrock proposition, for, next to the soldier veteran who stood in front of the guns, the nation is indebted to the old miners who produced the bullion that paid the expenses of the war.—*Sacramento News*.

Shasta County Coal.

The latest addition to the museum of the State Mining Bureau has been contributed by Oscar Schulze in the shape of a specimen of fine lignite coal from Section 12, Township 33, Range 2 west, 25 miles northeast of Redding. The analysis of the coal shows up well, and as the vein is said to be easily accessible by a short line from Redding, the California coal problem seems nearer solution than at any previous period. The analysis gives the following figures:

Water	9.50
Volatile carbonaceous matter	37.50
Fixed carbon	46.25
Ash	6.75
	100.00

The great trouble with all the California coal deposits is that the seams or veins are thin and of limited area, except in the Mount Diablo field, which has been nearly worked out. In many of the coal basins so far located the veins do not exceed one or two feet in thickness, and when they do there is such an admixture of slate as to render the product almost worthless on the market. Another difficulty has been that most of the coal deposits lie at a considerable distance from existing lines of railroad.

In 1874 a coal-bed 12 feet in thickness was exposed in Shasta county, not more than a mile and a half from the location of the present find. The deposit did not consist, however, of solid coal, but of alternate layers of coal and slate, the thickest coal seam being only 22 inches. Previous to the present discovery numerous coal croppings had been exposed in this part of Shasta county, but none of them justified working on commercial principles.

In Shasta county generally the coal deposits lie in the foothills, where the volcanic materials which cap the mountain spurs and ridges are generally underlain by a body of coal-bearing strata of recent origin. These strata consist of soft and unaltered shales and sandstones, and they are spread out unconformably over the upturned edges of the metamorphic gold-bearing slates which form so large a portion of the mass of the Sierra. Their general position is not far from horizontal, and the aggregate thickness of the coal-bearing strata is not more than 150 feet. They belong to the geological period which immediately preceded the commencement of volcanic activity in the Shasta region.

The new mine is said to prospect well, and the specimen of coal sent to the Mining Bureau is of superior quality. The seam is 20 feet in width.

Prospecting the Comstock.

The *Virginia Enterprise* says: The field of prospecting work upon the Comstock lode is yearly getting down to narrower limits, and the question now agitating the mining world is the redemption of mineral ground below the water-line. There is no limit to the country in that direction. The other way, it is bounded by the grass roots.

As matters stand, the Yellow Jacket series is engaged in prospecting an interesting block of mineral country between the 600 and 900 levels, with every prospect of opening out enough ore to run the Brunswick mill of 76 stamps for a few seasons. The outlook in Overman is very promising for the continuance of the extraction of pay ore. The Belcher and Crown Point are opening out ore to run on in their lower levels. Potosi is liable to show up milling ore at any day. Chollar is running steadily upon milling ore. Savage has ore, and in conjunction with Hale and Norcross is opening out more ore on a lower level than formerly operated. These two mines have a block of ground 500 feet in depth to the water-line that has been but little prospected. Gould and Curry has every prospect to produce ore this season. Con. California and Virginia has a big block of ground between the 1200 and 1500 levels that has not been prospected, and the company is also opening another block between the 1650 and the water level, which is about the 1900. The starting up of the Union means the thorough prospecting of a vast section of mineral country between the Union shaft on the east and the west wall of the Comstock, and between the Hendricks, Scorpion and East Sierra Nevada ground on the north, including the Sierra Nevada ground proper, to the Ophir ground on the south, and from the surface to the water level. The finding of an extensive body of ore in the section of country bounded as above described would inaugurate a boom on the Comstock of magnificent proportions. The country described lies within the walls of the Comstock ledge, and that's the place to look for ore.

DETECTION OF ORGANIC MATTER IN THE ATMOSPHERE.—Mr. A. H. Smee closes a glass funnel by drawing out its neck to a fine point, places it in a stand, and fills it with ice. He allows the aqueous vapor that condenses from the atmosphere on the outside to drop into a vessel, and measures the quantity thus accumulated in a given time and determines the ammonia by one of the usual methods. By this means, called "distillation by cold," substances that are decomposed by high temperature can be condensed. The perfume of flowers, for example, can be distilled by placing them under a bell-jar with the funnel.

Hydraulic Mining.

The condition of affairs in the old hydraulic mining towns is becoming deplorable. Business is almost paralyzed, there is very little money in circulation, and scores of families who were once possessed of good properties find it difficult to provide themselves with the necessities of existence. In most of the hydraulic districts the quality of the rugged ground and the high altitude preclude the possibility of doing much in the way of agriculture, and the people are left without any means of livelihood whatever. The gold is so widely scattered through the ground that drift mining is out of the question, and the future presents a very blank prospect unless some method is devised by which hydraulic mining may be resumed. The miners are living on patient and hopeful. They are becoming poorer every year and every moment, but there are thousands of them firm in the conviction that they have rights which must be recognized soon, and they abide in the belief that they will get justice. The hope that just now buoy them up is that the report of the Government Commission, which it is expected will be made public this month, may contain something in favor of the miners and possibly some suggestions for the relief of the hydraulic mining interest. If that report falls him, the miner has no resource to fall back upon except the almost hopeless minority interest of a handful of State legislators and one or two Congressmen in his behalf.

In his first message, Governor Markham has not forgotten his pledges to the miners, and he declares without hesitation that Congress should be invoked to assist in the solution of the problem, because the continued production of gold is a subject of national importance. That is true. It is not the miner alone who is interested in the resumption of hydraulic mining. It is his immediate concern, but of more moment still is the direct interest of sixty-six million people in maintaining an undiminished supply of the great medium of exchange for the public use.

The issue of the controversy over hydraulic mining is but a small portion of the area of the country. About one-half of that portion has had its rights upheld at the expense not only of the other half, but of the whole United States. It has been permitted to become a local question because the whole sixty-six million of our people did not realize that they were interested in the outcome. This was very clearly a mistake, and it is now the duty of our Congressmen, particularly those from the mining districts, to put this subject before Congress so forcibly and with such untiring industry that "the combined wisdom of sixty-six million of people," as embodied in the Government at Washington, shall afford relief not only to the long-suffering miners of California, but to every one in the country.—*Placer Republican*.

The Astronomical Society.

The largest and most active scientific society on the Pacific Coast is the Astronomical Society of the Pacific, the 55 members added at the last meeting bringing the membership up to 400. It is recognized as a "live" society, and applications for membership come from all parts of the world. It is probable, moreover, that the society will rapidly increase from this time on, as the by-laws have been amended by the addition of a new section authorizing groups of members of the society, outside of San Francisco, to form sections, each of which shall elect its own officers and adopt its own rules of government. None but members of the society shall be eligible to membership in sections. Under the provisions of this amendment, the members of a section formed at Chicago were elected members of the society, and the Chicago section was then recognized.

The directors adopted a seal, and resolved that, beginning with this year, all moneys received for life memberships shall be invested in a separate fund, only the interest from which shall be used in defraying the expenses of the society.

Messrs. Schaeferle and Burckhalter were appointed a Committee on Medals for 1891. As the next meeting will be the annual meeting, committees were appointed to audit the treasurer's accounts and to nominate officers and an executive committee. After the directors' meeting the society meeting was held, at which the following papers were read: "The Carleton College Observatory," by the director, Prof. W. W. Payne; "The August Meteors," by W. H. S. Monck, Dohlin, Ireland; "Corrections to Watson's Theoretical Astronomy," by W. W. Campbell, Ann Arbor, Mich.; "Notes on Dark Transits of Jupiter's Satellites," by John Tehhntt, Windsor, N. S. W.; "Motions of the Nebulae in the Line of Sight," by James E. Keeler, Lick Observatory.

THERE is considerable uneasiness among mining men on account of the proposition before the Legislature to tax patented mining claims in Nevada.

THE nitrate output of Chili is to be regulated, and the companies will shut down for five months of each year.

MURPHY & SEMLE struck a pocket near Centerville, recently, from which they took \$11,000 in fine gold.

Amalgamation at the Comstock Lode.

A Historical Sketch of Milling Operations at Washoe and an Account of the Treatment of Tailings.

NUMBER I.

[By A. D. Hodges, Jr. Read before the American Institute of Mining Engineers.]

I. Early Workings of Placers.

In May, 1850, the first gold from the Comstock lode was discovered in the sands near the Carson river. It had been washed down by natural agencies, through Gold Canyon, from the decomposed rock of the ledge above. Within a few weeks the precious metal was traced more than three miles in shallow deposits along the bed of the canyon from the river to the Devil's Gate—a narrow, rocky cleft, notable to the teamsters of a later day chiefly as the place where "Uncle Jimmy Fair" collected high tolls, and could not reduce the rates because "this was all he had for the education of his poor children."

From 1850 to 1857 a floating band of miners, whose number varied from 20 to 200, washed the Gold Canyon placers with rockers and long-toms, making from \$4 to \$5 a day each until the last-named year, when the deposits were in great measure exhausted. The chief settlement of these miners was at Johnstown. During only a third of the year was the water supply sufficient for their work. The remainder of the time they utilized in desultory prospecting of the hills, and in occasional forays for supplies among the Mormons in Carson valley.

In 1857 the Groesch brothers discovered the Comstock lode at some point, now unknown, in Gold Hill, but their discovery perished with them. Early in 1858, the "Pioneer Quartz Company," having located several of the small surface veins around Silver City (whose connection with the main lode has never been definitely shown), built an arrastra and worked some of their ore, but the returns were so small that they soon abandoned this business. The following winter, James Finney and his partners found gold in place in crumbling surface rock at Gold Hill, located claims there and worked the auriferous material in rockers with good results. Other claims were speedily taken up, and in the spring of 1859 half a dozen arrastras were in profitable operation. In the following summer arrastras were in use also at the new discoveries in Virginia City, the number at Gold Hill was largely increased, and a few were started down on the Carson river.

II. The Discovery of the Washoe Process.

Up to this time the miners had sought for gold only, with no thoughts of any other metal than that which the California mines were yielding. But the assays made in June, 1859, by Melville Attwood, showed that the Comstock lode was a rich auriferous silver deposit, and the treatment of silver sulphurets became an important question. Samples of the ore were sent to be tested in the various metallurgical works of California, and some of these samples came into possession of Almarin B. Paul, an able and energetic millman of Nevada City. Paul was fully posted on all the details of gold-milling, as practiced in California, and had read various works on the metallurgy of silver. It occurred to him to treat the sulphurets with the chemicals of the patio process in the pans then used to some extent in the gold-mills, and the results of his tests, made in the autumn of 1859, convinced him that this treatment could be applied with success to the Comstock ore. With characteristic energy he organized the Washoe Gold and Silver Mining Company, No. 1, and on May 25, 1860, began work on a mill-site near the Devil's Gate, in Gold Canyon. On June 7th he ordered his machinery at the Miners' Foundry, San Francisco, his enthusiasm and confidence being undisturbed by the general distrust and even ridicule with which his plans had been received. On June 12th, he signed contracts to work several thousand tons of ore from the Gold Hill claims (at \$30 per ton), the contracts being made conditional on the completion of his mill within 60 days from date—a condition which only a bold man would accept in those times, when material for construction was so far away and transportation was so difficult and uncertain. On August 11th, just within the limits of his contracts, the 24 stamps of his Pioneer mill commenced to drop. Three hours later, Charles S. Coover and Dr. E. B. Harris, who had been inspired to rivalry by Paul's example, set in motion the machinery of the little eight-stamp mill which they had built near by in Gold Hill.

Paul crushed the ore dry in his batteries, and amalgamated it in Knox pans, which were 4 feet in diameter by 14 inches deep, and held charges of about 300 pounds each. The light iron muller, revolving 12 or 13 times per minute, did not grind, but served merely to stir the pulp for the purpose of effecting a distribution of the quicksilver throughout the mass. Copper plates were fastened in the pans in order to hasten the reduction of the silver. A part of the amalgam adhered to these plates and was scraped off twice a day. The rest was drawn off at intervals through a discharge-hole.

Each charge was treated with 40 pounds of quicksilver, a pint of salt and a few ounces of copper filings or copper sulphate. The pans were set on brick furnaces and heated by wood-fire, and the water used was warmed by the

located wherever there was any available water exhaust from the engines. At a later date, in place of the brick furnaces, iron stoves were used, with circular flues, through which the heat and smoke were led beneath the pans. Then Paul suggested steam-chambers fitted to the pan-bottoms, a suggestion adopted and perfected by Howland.

Thus Paul invented the Washoe Process. With due acknowledgment of what others had done, to him should be given the credit of being the first to work out, and apply successfully on a large scale, the method of treating silver-ores by pan-amalgamation.

III. The Building of Mills.

Paul's first mill-runs, and also those of Coover and Harris, gave satisfactory results, and increased materially the mining rush and excitement which had now set in. Claims were taken up all over the country in the neighborhood of the lode, and mill-sites were quite a number of mills were built in 1860. Paul's company (the Washoe Gold and Silver Mining Company, No. 1) at once putting up a large establishment at Gold Hill. In 1861 there were already 76 mills erected for the purpose of treating Comstock ore, with 1153 stamps and an estimated daily crushing-capacity of 1200 tons; and 20 more were planned or in process of construction. There were also 40 or 50 arrastras and several patio-yards. The mills lived Seven-Mile, Six-Mile and Gold Canyons, from Virginia City to the Carson river, and the Carson river, from above Empire to below Dayton; and several were placed more than a dozen miles away, at Ophir and Franktown, on the borders of Washoe Lake. The mill-building mania kept pace with the mining excitement which culminated in 1863, and was followed by a stock-panic in 1864, although the bullion-production of the lode continued to increase. In this time some 700 mining companies had been incorporated to operate on the Comstock; but of these only a hundred possessed prospected mines, and only 14 had paid dividends. The number of mills built approximated about 150, the exact figures being unobtainable, on account of the indefiniteness and variance of the published statistics. Their capacity was always in advance of the ore supply. Many were erected for mines which never produced anything except litigation and assessments. A large number were hastily and poorly built, and, as rapid improvements in machinery and construction were made, soon became antiquated; but some, notably the Ophir and the Gould and Curry, were erected in a most gorgeously expensive manner. The majority were pecuniary failures from the start; but, in the more fortunate cases, where there was a constant supply of rich ore, with charges varying from \$20 to \$30 per ton, large profits were obtained.

The first published list of Washoe Mills, with full details, so far as I know was that given in the MINING AND SCIENTIFIC PRESS of Sept. 29, 1866, and this is avowedly incomplete, it being stated that there were "a few small mills, running irregularly, not enumerated." The total number given is considerably less than that contained in the "Surveyor-General's Report," for 1865, where eighty mills are mentioned. The Report of J. Ross Browne, United States Commissioner of Mining Statistics, under date of March 5, 1868, states (pp. 324-328) that there were in Storey, Lyon, Ormsby and Washoe counties, in 1867, 122 mills with 1921 stamps. The same report (pp. 352-360) gives a detailed list of the mills in the same counties which were crushing ore from the Comstock lode in 1866. Here, the numbers are 77 mills and 1462 stamps. According to this last list, there were seven mills with 40 to 80 stamps each, two mills with 30 stamps each, 20 mills with 20 to 25 stamps each, 39 mills with 9 to 18 stamps each, six mills with eight stamps each, three mills with five stamps each.

The seven largest mills mentioned were the following:

1. The Imperial mill, 44 stamps, at Lower Gold Hill, built in 1860. I have always understood that this was the second mill erected by Almarin B. Paul, who, in different publications, is said to have put in 48 and 64 stamps. The mill came into the possession of the Imperial Mining Company and ran for many years.

2. The Gould and Curry mill, 80 stamps, at the junction of Six-Mile and Seven Mile Canyons, on the site occupied later by the Omega Tailings mill, was built in 1861 by the Gould and Curry Mining Company. Its costly construction and brief career have been described frequently.

3. The Ophir reduction-works, 72 stamps, with furnaces, barrels, patio-yards, etc., erected in 1861 at Ophir City, in Washoe valley, by the Ophir Mining Company, rivaled the Gould and Curry mill in expense of building and shortness of existence.

4. The Rock Point mill was built in 1861 on the Carson river, near Dayton. It had 40 stamps, which were increased to 56 in 1864. It belonged to the Imperial Mining Company and had a successful career until the building of the Virginia & Truckee railroad diverted its supplies to more accessible establishments.

5. The Mexican mill, 44 stamps, on the Carson river, at Empire City, was built in 1862 and was quite noted in early days. It was owned originally by private parties and employed educated metallurgists. Here experiments were made and processes tried which aided essentially in the development of silver-amalgamation at the Comstock. In 1868 the mill was bought by the Yellow Jacket Mining Company. Subsequently it passed into the

hands of the "bonanza firm." It was running at last accounts.

6. The Washoe reduction-works, better known as Dall's mill, 60 stamps, were built in 1863 at Franktown, in Washoe valley, by Captain J. H. Dall, after the general model of the Ophir reduction-works, and ran as a custom-mill. They were destroyed by fire in December, 1866, but rebuilt the next year and maintained a precarious existence until June, 1871, when they were again burned down.

7. The Morgan mill, afterward known as the Yellow Jacket, on the Carson river, at Empire City, was built as a custom mill, with 20 stamps, by James Morgan in 1864. It was sold to the Yellow Jacket Mining Company in 1865, and enlarged to 40 stamps, 20 of which weighed 1050 pounds each. In 1871, it passed into the hands of the Nevada Mill Company and worked ores for this company until 1875, when it was purchased by the Pacific Mill Company, which still owns and operates it.

IV. Milling Combinations.

A new era in the mill business may be dated from the advent, in 1864, of William Sharon as agent, in Virginia City, of the Bank of California. Sharon was a shrewd financier and keen speculator, was backed by William Ralston, manager of the parent bank in San Francisco, and had an enthusiastic faith in the Comstock lode. When he arrived, although stocks were low and mining depressed, he unhesitatingly loaned money to mining companies and mill-owners at much lower rates than had previously prevailed. The rate of interest had been from 3 to 5 per cent per month. Sharon asked 2 per cent and soon had put out large sums at this figure.

Worked-out mines and idle mills being worse than valueless as securities, and no new bonanzas coming to light, while assessments continued frequent, the bank seemed for long to be on the point of sustaining heavy losses, and many of its stockholders became frightened. But Sharon possessed the confidence of those holding the largest interests in the bank, and with their aid continued to carry out the plans he had formed. He and his friends, known popularly as the "Bank Ring," secured control of the principal mines, buying the shares at low figures, and by able stock manipulation not only guarded against loss but made very large profits. The next step was to acquire mills and form a milling company under the corporate name of the Union Mining and Milling Company. The mills were obtained, first by foreclosing mortgages and then by a sort of "freezing-out" process. The number of these establishments in Washoe had been steadily decreasing since 1863, but the capacity of those standing had been enlarged, so that competition was sharp and milling-charges were falling. In 1865, when the effects of Sharon's plans commenced to be felt (and these plans included a business-like working of the mines), the price of crushing fell from \$25 and \$22 per ton to \$17 and \$18. This year, according to the statements of Samuel Bowles, in the Springfield Republican, there were 77 quartz-mills, with 1019 stamps, working Comstock ore, capable of crushing daily about 1850 tons, but running at only two-thirds capacity. Of these mills, 22 were connected with mines and 55 were doing custom-work. The troubles of the custom-mills were soon greatly increased by the refusal of the mines controlled by Sharon and his associates to give them ore at any price; and thus many mill-owners were obliged to sell their properties to the Union Mill Company (or to join it) on such terms as this company would allow. The Union Mining and Milling Company was formally incorporated in 1867, after seven mills had been taken by foreclosure by the bank. These seven mills were at once transferred to the new company, whereupon the price of milling asked by outsiders fell to \$15, and then to \$10 per ton. Within a couple of years more, the company had acquired "nearly 30 mills" (MINING AND SCIENTIFIC PRESS, Aug. 24, 1869), and for a time had almost a monopoly of the milling business at the Comstock. Possessing ample capital and doing a profitable business, it made many improvements in the construction of mills, and in 1871, built the largest and best establishment of the kind in Washoe—the Eureka mill, on the Carson river, with 60 stamps of 940 pounds each, and 24 improved pans. The motive-power was furnished by a 52-inch Leffel-turbine placed with its shaft horizontal—the first time, it was said, this had ever been done.

Sharon aimed at complete sovereignty over the Comstock, but the kingdom was too large and the fortunes of the various mines were too fluctuating for him to be able to hold everything against his rivals. Not being a miner, he had to depend on others for information concerning the interior conditions of the mines, and could not always be sure of the correctness of the information thus derived. He openly accused Jones of deceiving him in 1871, concerning the Crown Point mine, and a bitter controversy ensued. He also had a public discussion with John Mackey as to whether this gentleman had not induced one of Sharon's experts to give deceptive reports, and is said to have declared that he would "have John packing his dinner-pail yet"—a prophecy unfulfilled at last accounts.

The first formidable competitor to come into

*The old Gould and Curry mill had 80 stamps, the Ophir reduction works had 72, and Dall's mill had 60; but none of these were so well equipped or had the capacity of the Eureka, and the first two had been destroyed at this date.

general notice was the Nevada Mill Company, formed by Alvinz Hayward of San Francisco and John P. Jones of Gold Hill, who, in 1871, wrested from Sharon the control of the Crown Point mine and diverted large supplies of rich ores to the mills which they acquired. This mill company controlled by purchase and lease as many as 15 mills at one period. Among these, the most noted were the Morgan, the Mexican and the Brunswick. The original Brunswick mill, built in 1863, was an eight-stamp establishment. Passing into Sharon's hands, it was rebuilt and improved. As remodelled in 1871 by the Nevada Mill Company, it had 56 stamps of 550 pounds, 26 Horn pans with settlers, etc., and vied with the Eureka mill in excellence of construction. Its last runs were for account of the bonanza firm.

Jones and Hayward did not secure many Comstock mines. When the Crown Point bonanza was exhausted, their controlling influence was diverted to other districts, and their most important mills were taken over by the next company to be named.

In 1869, James G. Fair and John W. Mackey of Virginia City had secured control of the Hale and Norcross mine, then in bonanza, and associated themselves with James C. Flood and William O'Brien of San Francisco. These associates formed the Pacific Mill Company and purchased several mills. They next gained possession of the Savage and the Bullion mines; but they obtained no ore from the latter, and only low-grade material from the former; and before long the Hale and Norcross ore body was exhausted. While in search of new properties, in 1871, they acquired the Virginia Consolidated (afterward divided into the California and the Consolidated Virginia mines) where the Big Bonanza was developed in 1873. The history of the bonanza firm is well known. The Pacific Mill Company built the famous Consolidated Virginia and California mills, the most noted quartz-mills in the world, and acquired a supremacy surpassing that of the Union Mining & Milling Company.

V. Various Amalgamation Processes Tried.

Paul's results in 1860 were accepted by the great majority of miners as fully proving the efficiency of his process. But the largest companies, the Ophir and the Gould and Curry, with exaggerated ideas of the richness of their ores, and under the influence of conservative ideas, preferred to adopt methods which had the advantage of greater age.

In 1860, the Maldonado Brothers, who were Mexicans, put up extensive yards in Virginia City to work the ore of the Mexican mine by the patio process. Their example was followed by a few others, among them the Ophir Company, which tried this method at its large establishment at Washoe valley. The patio process is slow, imperfect and expensive. Brought into competition at the Comstock with other methods, it proved a failure and was soon abandoned.

The "Freiberg process," as it was commonly called—chloridizing, roasting and amalgamation in barrels—was adopted at the Ophir works and at Capt. Dall's mill, both in Washoe valley, at the Mexican mill in Empire, and at the Central mill in Virginia City. Kestel & Co., and Sutro & Co., in their Dayton mills, roasted their ores and then amalgamated in pans. Roasting was very expensive at the Comstock. Partly on account of the cost, and partly from the desire to get bullion returns as speedily as possible, the Freiberg process was given up. Dall alone retained it to the end; but his mill received only the richest grades of ore, which could afford to pay high transportation rates and a milling charge of \$45 per ton; and these ores became very rare.

The Gould and Curry mill adopted the Vetch process, which was about the same as the patio, except that steam tubs were substituted for barrels. The Central mill used this process in the beginning. In neither mill was the method a financial success. The Gould and Curry mill changed to pan-amalgamation, and the Central made trial of the Freiberg process.

About 1866, a smelting furnace was built near Galena, in Washoe Valley, and run fitfully for a year or two.

Electrical and other methods, most of them fearfully and wonderfully conceived, have had brief trials at the Comstock. But all yielded to the Washoe process, which, working rapidly and neatly, and being so well adapted to local conditions, soon was in universal use at the lode.

(To be Continued.)

SULPHIDES.—The 1100 ounces of sulphides shipped to the Selby Smelting Works from the Holmes mine netted \$775 above all expenses. The sulphides came from 75 tons of refuse ore from the Holmes waste dumps, treated by the leaching process as an experiment. The success attending the first trial has encouraged the Holmes people so much that works having the capacity for treating 100 tons of ore per day are to be erected. There are fully 400,000 tons of refuse ore on the dumps, as well as immense quantities of low-grade ore in the mine that can be worked at a profit. It costs \$3 per ton to mine the ore and but 15 cents per ton to leach it.

A block of marble weighing 27,000 pounds was shipped from the Ioyo quarry last Thursday for the Mills building in San Francisco.

THE museum of the State Mining Bureau in this city was visited by over 26,000 people last year.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLINTON CONSOLIDATED.—*Ledger*, Feb. 7: Parties representing this company were in Jackson early this week, and paid to Eli Gardner, from whom they bonded the property they are operating on near Clinton, the sum of \$7500. Gardner thereupon gave them a full deed, taking a mortgage upon the property to secure the balance of the purchase price, amounting to \$13,000, which is payable on or before the first of June next. The closing of this sale indicates that the company are satisfied with the prospects of the mine, as indicated by several months' experience in crushing the rock. The company furnishes employment to about 50 men. It is, in fact, one of the most important mining enterprises of the county.

GOVER.—A rich chute of ore was struck on the 600-foot level of the Gover mine, the 28th ultimo. It was found by cutting back into the footwall about three feet from the east vein they had been working. They have cut into it some 10 feet and it shows an even grade of ore the whole distance. It is considered one of the most important developments made in the mine since its reopening, and ought to place the Gover among the leading dividend mines of the county.

BUNKER HILL.—Have their new hoisting works in successful operation. A. Knight's water-wheel is stationed at the mill 900 feet from the hoist, where, by a separate pipe line, water is brought to it as power. From here by endless cable the power generated by the wheel is transmitted to a friction gear hoist at their new shaft. This hoisting machinery is capable of going to a depth of 1500 feet. This is a most important undertaking by these people, and the shaft will develop a large portion of their claim never before prospected.

REAVES MINE.—Mill shut down and as soon as the new Eastern stockholders arrive preparations will be made to sink a shaft. Have a large well-defined ledge in sight, and in winze sunk on vein ore was nearly double the value of the surface rock.

FROM SUTTER CREEK.—Developments at the Rose mine are taking on more of a permanent aspect than at any time. Machinery is being moved on to it from a mine in El Dorado county, that has been abandoned there by Hayward. There is abundance of rock in sight, of very low grade. Hayward and Hobart are backing the enterprise with plenty of money, and operations are bound to continue for some time to come. The Belmont mine, formerly the Sutter Creek, is fairly organized, and operations are to start forthwith. J. H. Tibbets still has the management, and is going to lay in a supply of timbers, laggin, etc., right away.

Calaveras.

CUSTOM MILL.—*Chronicle*, Feb. 7: M. D. L. Wickham & Son, of West Point, have constructed a 5-stamp custom mill on Bear Creek. The mill will be ready to run in a few days. There are already some 50 tons of rock at the mill waiting to be crushed. The mill will be run by water-power.

QUARTZ.—*Mountain Echo*, Feb. 5: We understand that as soon as spring opens there will be a general revival of the quartz-mining industry in this locality, and that several of the mines that have been closed down for the past year or more will be reopened. That there are valuable mining claims in this vicinity, lacking only the means to develop them, no person familiar with this mining district can deny. We look forward with a hope of seeing much work being done on these different lodes, some of which are now bonded to men who mean business. Foremost among these is the Brunner mine, which, we are informed, will be reopened shortly.

MINING NOTES.—The work of running levels on the 600-foot station in the Stickle mine is going ahead steadily. The Gold Cliff mine is running full-handed. The mill is kept in motion day and night, and on the whole, the management is satisfied with prospects of this mine. Work is going on steadily at the Lane & Tuoloch mine, and the mill is running the full complement of stamps day and night. The Utica mine is again running in full force as of yore. The chlorine works are kept in operation constantly.

El Dorado.

VAN.—*Georgetown Gazette*, Feb. 4: J. W. Conan, who has been here since Saturday looking after his interest in the Van mine, accompanied by Supt. P. P. Tischer, left for San Francisco yesterday, for the purpose of securing hoisting works, mill, pump, etc., for the mine. With the exception of keeping the water out of the mine with the present pump, work has been suspended until the machinery arrives. A good deal of talk has been going on, relating to some differences existing between Newland and Conan, and it looks probable that some litigation may follow.

NUGGETS.—*Mountain Democrat*, Feb. 7: Dutchy, the long-haired man, has a rich channel in his mine, and is taking out some fine gold nuggets. Last Sunday on my way to Grizzly Flat, I saw the Ohio mill was running eight stamps, and was informed the mine was paying well.

Mono.

BENTON NEWS.—*Inyo Register*, Feb. 7: Encouraging reports come from up in the Benton section in regard to the mines thereabout. The ore in the mines being worked on Blind Springs Hill is generally of better character than ever before taken out. The Borrasso and Cornucopia are both being worked, the latter mine producing some good grade ore. Hoskins is working several men, and has enough ore in sight in his claim to justify an increase in working force which he is about to make. Parties working in Montgomery district have lately uncovered a four-inch ledge carrying an inch of incredibly rich ore, assays of this seam giving 13,000 ounces silver per ton. If this holds out in any quantity, its fortunate possessors will realize a fortune. The Montgomery section has produced small pockets of as rich ore as any region in the world, perhaps, and this news indicates that its days of production are by no means over. Blind Springs Hill, and in fact that whole section, carries mineral enough, without doubt, to make it one of the most notable mining sections in the West, the only

trouble being that the country was in the past ages apparently formed by building it of all the odds and ends of almost every rock known to geology. In consequence of the mixed and mingled character of the country rock, the ore is found in pockets. Its richness, however, is uniform, and this pocket work ultimately pays good returns. A governmental policy which will encourage silver production will, without doubt, inspire Benton with energy enough to again make it a large producer.

Mariposa.

COULTERVILLE.—*Gazette*, Feb. 7: Chas. Sutherland has returned from the city and will sink the main shaft on his mine near town 100 feet deeper. The owners of the Black Bart mine were in town this morning, making arrangements for a more systematic working of their mine. A big find was made on Quartz mountain a few days ago. The owners are very reticent as to the amount of gold taken out, but it is known that as high as \$100 a ton was taken out. Joe Metta has also struck a pocket near the Martin & Walling mine which has made him exceedingly happy. Joe Cuneo and his partner have also struck a pocket on their mine near Spring gulch, about five miles north of Coulterville, yielding some \$500 or \$600, with a fine prospect of doing better as they go down with the shaft. John Demartino has bought the interest of his partner, C. S. Benn, in the Southern Cross, Mountain View and Sweetwater mines, Mr. Benn having a call to go to Granada, Central America, to superintend some mines for a party of San Francisco capitalists.

Nevada.

THE EXTRACTION WORKS.—*Grass Valley Union*, Feb. 6: J. W. Higginbottom, manager of the extraction works, was in town yesterday for the first time in a number of weeks. He informed a representative of the *Union* that the favorable winter had been of great advantage in forwarding the work of construction, as it had permitted the getting of all the buildings under cover, and that no hindrance could now come to the setting up of the machinery, whatever may be the weather conditions during the spring months. All of the machinery has been received with the exception of the Krom rolls for crushing, which have been manufactured in New York and are now ready for shipment. A Bruckner furnace is now being set up, and stone foundations are being laid on which to set the tanks, which are large structures. The entire plant of the extraction works is being put up in the best manner and of sufficient capacity to handle the concentrates and ores that will be furnished by the several mining districts of this and adjoining counties.

W. Y. O. D. MINE.—*Tidings*, Feb. 3: The owners of the W. Y. O. D. mine will soon commence improvements on their mine which will place it among the best fitted-up mines in the district. The ledge both in the shaft and in the drifts is looking well, and the owners are confident of having one of the best paying mines in this district. So confident are they that a survey is now being made for a pipe-line to convey water to the mine to be used as power. The pipe will be 12 inches in diameter and will be connected with the Empire pipe, near the Empire mill. Four water-wheels will be put in and a new ten-stamp mill, with all the latest improvements, including concentrators, etc., will be erected. The owners are now negotiating for the purchase of the new mill. It is estimated that these improvements will cost \$15,000, and most of this money is now on hand to pay the expenses. The W. Y. O. D. is sure to come to the front as a gold-producer, and there are no more deserving miners in this country than the energetic and hard-working young men who have made the W. Y. O. D. what it is to-day by their indefatigable endeavors.

ANOTHER DIVIDEND.—The Idaho mine has not lost its grip yet by any means, as is shown by the manner in which dividends are regularly declared. Monday evening, Dividend No. 250 of \$2 per share, aggregating \$6200, was ordered paid to the stockholders of this famous mine.

EMPIRE MINE.—*Grass Valley Union*, Feb. 4: The old Empire mine is showing better at the present time than it has done for years previously, as the recent finding of a good pay shoot on the 15th level is found to extend down to the 17th level, and is holding its strength below that level. The ore is all of high grade and is giving excellent returns. This shoot is south of the shaft and goes into the slate formation, where it is not disturbed by any appearance of granite, which has at times broken up the vein to the north of the shaft. There is now every indication that the Empire is entering upon a new era of very profitable production which will last for a long time, as the company has a large extent of ground, and the deepest workings are showing the ledge to be regular in place and of good size. There are four distinct pay shoots in the Empire, all of which produce high-grade ore, and the quartz between the shoots is of fair milling quality. The full head of 40 stamps of the Empire mill are now kept constantly going, 25 of which are run on the ore from the pay shoots and the others on tribute and inferior rock. Supt. Starr is making a decided success of the Empire, which has been worked now longer than any other quartz mine in the State, as it commenced making a record in the year 1857.

THE CENTENNIAL MINE.—*Tidings*, Feb. 5: Another Grass Valley mine soon to be started is the Centennial mine, which was one of the earliest worked quartz claims in this district. In 1855 it was known as the John Judd claim and was profitably worked by that gentleman. A change in ownership took place in 1859, and a company named the Wide Awake bought the ground and erected machinery. This company worked the mine to a depth of 300 feet on the incline, the quartz paying a handsome profit. According to Bean's history of Nevada county, which is good authority, a crushing of 400 tons of ore yielded \$26,000, equal to an average of \$65 per ton. Not much work was done upon the mine from 1861 until 1876, in which year the ground was purchased by John Trenberth & Co., who organized a company and rechristened the mine the Centennial. Mr. Trenberth, as superintendent, worked the mine successfully for four years, taking out in all about \$200,000, from which yield a number of handsome dividends were declared. The lowest depth as yet attained upon the ledge is 600 feet, measuring on the incline, and the mine has produced in all, to its different owners, over half a million dollars in bullion. The property is now entirely owned by Mr. H. Silvester, who has bonded it to Mr. A. W. Stoddard for a term of two years.

MORE SPECIMENS.—*Grass Valley Union*, Feb. 8: Yesterday afternoon some very rich specimen ore

was taken from the Hartery mine and quite a lot of it was brought to town and placed in the Citizens' Bank. The general average of the ore at the Hartery is good and the specimens are found nearly every day. A bar of gold, amounting to about \$3000, was also brought to town, it being the result of a cleanup made to-day.

Placer.

ECLIPSE.—*Placer Republican*, Feb. 4: Fulweiler & Tabor, attorneys for the Eclipse Mining Co., have still further complicated the network of litigation in which the mine is involved by filing liens on the property for attorney's fees to the amount of \$750. The Cedar Creek Co. has given a contract to T. Bailey to run a prospecting tunnel in the Oak and Cedar drift mine at Dutch Flat. Mr. Bailey has begun work with a small force of men, and as soon as sufficient headway has been made he will work two shifts.

VALLEY VIEW.—*Placer Herald*, Feb. 7: The old Whiskey Diggins quartz mine, now known as the Valley View, which has recently been put in shape, and on which a Huntington mill has been erected, has made one or two runs, we understand, and the result is very satisfactory to the new owners. The margin of yield over and above the cost of mining and milling is said to leave a handsome profit to the investors.

Siskiyou.

QUARTZ AND GRAVEL.—*Yreka Journal*, Feb. 4: James Ironsides, who is interested in a quartz ledge on Cherry creek, Deadwood mountain, between Yreka and McAdams creek, has found a quantity of tellurium, similar to platinum, a very valuable metal, and sure indication of rich gold deposits wherever it is found. The ledge at present working is about five or six inches wide, but as the work of sinking down on it progresses, the ledge shows gradual widening, with prospects of proving a wide and valuable lode when thoroughly developed. The river miners on the Klamath are still working their claim, with prospects of not being obliged to pull out all winter, owing to the absence of rain and snowstorms to raise the stream. Not much work is being done this week, as all the Chinese companies and Chinese hands have knocked off to celebrate Chinese New Year. We hear that some very rich strikes have been found in the Salmon river district, near the Black Bear mine, one of which, the richest of all, having been accidentally discovered by a lady while out walking with some friends. The miners at Oro Fino and Quartz Valley are anxiously awaiting rain and snow to furnish water, not having been able to start work yet in their claims, in consequence of no water in the ditches. Several good quartz ledges have also been found lately in these two districts, which are now being worked by the discoverers in developing them. Jilison & Co., at Cottonwood, have completed arrangements so as to commence drifting on the blue lead in their claim, and expect to take out blue gravel on an extensive scale during the coming spring, with certainty of rich reward, as all the blue gravel, thus far prospected, has paid exceedingly rich. A new ledge of quartz was discovered last week at the head of Greenhorn creek, between the north fork and the main creek, by parties from Cherry creek, whose names we have been unable to learn at present. The ledge has every appearance of being permanent and prospects exceedingly rich, a piece of the quartz of the size of a man's fist yielding \$3 on being pounded up in a hand mortar.

BIG HOPES.—*Siskiyou Telegram*, Feb. 7: The owners of Lash & Co.'s mine on Lee's place, on Greenhorn, still have big hopes for a bonanza. Some days ago the bedrock took a jump for the hill, necessitating the digging of a bedrock vein four feet deep and 80 feet long. Big pay is expected when they are able to proceed with the work again.

Tuolumne.

STILL ON DECK.—*Union-Democrat*, Feb. 7: "Played out," "gone in," "no more gold there." These expressions greeted one on every hand a month ago whenever the Bonanza mine was brought into discussion. She now hobs up smilingly and says "ain't you tooling," and shakes her golden treasures from her earthy bed to the tune of \$14,000 and promises faithfully to send another shower ere the scorching summer sun beats down on her surface. It is plainly evident that the Bonanza intends to keep up her reputation, and her practical and energetic workers are going to assist her in doing so. The recent strike in this mine is encouraging both to the owners and to Sonora.

THE BONANZA STRIKE.—*Tuolumne Independent*, Feb. 7: The reports of an immense strike in the Bonanza mine, in town, have been greatly exaggerated. For a month past they have been getting very fair prospects from \$50 up, and a week or 10 days ago they got a pocket of about \$70,000. This was all crushed last Friday and Saturday and will clean up between \$12,000 and \$13,000, the gold assaying \$18 to the ounce. There is no indication of a pocket at present. They are making a crosscut west to strike the west crossing. The expense of running the mine since striking the last big pocket has been about \$30,000, so it will take considerable more than this last find to make the boys even.

NEVADA.

Washoe District.

CON. CAL. & VA.—*Virginia Chronicle*, Feb. 7: 1100 level: Making good progress in cutting out the shaft station, which will be completed the coming week. 1200 level: Continue to extract some milling ore from above the line of drift run south from the east crosscut No. 1 from the south drift from the shaft station. 1300 level: Continue to extract some ore from the point where the upraise carried up from the end of the east crosscut from the south drift connected with the fourth floor stopes. The east crosscut from the shaft station (Con. Va.) has been extended 40 feet; total length, 65 feet, continuing in porphyry. 1500 level: The ore which is exposed in the opening 43 feet above the sill floor of this level now shows a width of nine feet on the eighth floor and continues of good quality. 1600 level: Continue to take out some ore along and above the line of the drift run east through the old stopes on the sill floor of this level, also from the stopes which we are running southerly from that drift. Continue to stoop out ore at a point 200 feet south from the north line of the California ground and 44 feet above the sill floor of this level. The quality of the ore has improved and will show an average assay value of \$33.50 per ton. 1650 level: Have continued to extract the usual quantity of ore

from the various openings. From the bottom of winze No. 2 sunk from the south drift on the east side of the vein down to the south drift on the 1750 level we are now working upward in forming a second compartment to the winze. No. 3 was started and has been sunk eight feet through the timbers of old ground which contained milling ore. There has been extracted from all parts of the mine during the week 1568 tons of ore which was shipped to the Eureka mill. The average assay value of all the ore worked at that mill during the week (1575 tons) was \$22.50 per ton. Bullion shipped to the Carson Mint, assay value, \$59,501.04.

OPHIR.—Upraise started from the west end of the drift run north from the drift run west from the winze, 122 feet below the sill floor of the 1300 level, has been carried up eight feet. From the top of this upraise a west crosscut has been advanced 14 feet in quartz of low assay value.

MEXICAN.—East crosscut No. 1, 1465 level, started from the north lateral drift at a point opposite west crosscut No. 1 has been extended 27 feet; total length, 402 feet, passing through a softer porphyry formation.

UNION CON.—The east crosscut No. 2, 1465 level, started from the north lateral drift at a point 200 feet north from the south boundary line of the mine, has been extended 29 feet; total, 545 feet, continuing in a formation of porphyry and clay.

YELLOW JACKET.—Shipping 50 tons of ore daily, assaying \$18 per ton, battery assays. We are doing extensive prospecting work.

JUSTICE.—The north drift, 322 level, has been advanced 22 feet during the week and is now out a total distance of 271 feet; face in hard rock. The south drift from No. 1 winze, 490 level, was advanced 21 feet the last week; total distance, 113 feet; face in fair-grade ore. Shipped 153 tons of ore worth, as per battery samples, \$17.07.

KENTUCK.—The 250 raise was continued 5 feet during the week and then stopped, pending the completion of the connection between the 950 winze and 1000 raise. The raise in the east ledge on the 1000 level has not been advanced, as it will be necessary to bring in air there before going farther. We are now engaged on that work. The 1000 raise in the west ledge was advanced 7 feet during the week, making its height 14 feet. It will connect in a few feet with the bottom of the 950 winze. Started a north drift from the bottom of this raise, which is in 14 feet from the main east crosscut. The face is in quartz, with spots of ore in it.

CROWN POINT.—The northwest drift on the 500 level has been stopped, and at a point 120 feet in we have started a west drift, which is out 18 feet. The face of the drift is composed of quartz and porphyry.

CON. IMPERIAL.—Work is still being confined to following up and taking out small streaks of ore on the upper level and overhauling the old stopes of the mine.

SEG. BELCHER.—The 600 level, south drift, has been extended 26 feet during the week, and is now out 155 feet; the face is in soft porphyry.

OVERMAN.—Have extracted 385 tons and 1200 pounds of ore. Shipped to the Brunswick mill 387 tons of ore. Battery assays average \$14.75 per ton. Upraise from the northwest drift on the 1100 level has been extended 12 feet, passing through ore; total length, 153 feet. Upraise from south drift has been extended 16 feet; total length from the track on the slope, 173 feet; formation, quartz, carrying ore of a fair grade. Incline upraise on eighth floor of 1200 stoep has been advanced 21 feet through quartz of a low grade; total length 34 feet. On 1000 level south-west drift has been advanced 25 feet through porphyry; total length 167 feet. On the 850 level south drift has been advanced 28 feet through porphyry; total length, 332 feet.

CONFIDENCE-CHALLENGE.—The north drift on the 300 level is in 172 feet. The face shows quartz having no value. This drift is 41 feet in Confidence ground. The east crosscut from this drift is out 28 feet. The face shows clay. This crosscut has been stopped for the present. The joint Confidence and Challenge raise from the 750 level is up 154 feet. The top shows quartz having no value. The Confidence and Challenge west crosscut from the north drift on the 1100 level is out 139 feet. The face shows quartz having no value.

SAVAGE.—Milled 530 tons of ore, the average battery assay of which was \$14.80 per ton. Bullion on hand, \$25,188.40. The north upraise from the 300 level is carried up 87 feet; top in low-grade ore. On the 400 level the intermediate east drift was extended 20 feet; total, 40 feet. On the 500 level No. 2 a north upraise is advanced 30 feet, following the ore. The north stopes from this level are connected with the same floor north on the 400 level. On the 1300 level east drift was extended 19 feet; total, 126 feet. At a point in the winze 75 feet below the 1300 level are cutting out a station for an intermediate level and are extracting ore.

HALE & NORCROSS.—There is no change in the formation in any of the drifts since last report. We have men on repairs in the main shaft and wherever necessary on the different levels.

ANDES.—During the past week north drift, 420 level, was extended 16 feet through a formation of quartz and porphyry. East crosscut from south drift on 420 level was advanced 10 feet; face in clay and porphyry.

CHOLLAR.—Winze 80 feet south of north line, 750 level, is down 55 feet, bottom in clay and quartz. The station from 1400 level is in 17 feet. Repairs to the head incline are nearly completed. Extracted and sent to the mill the past week 542 tons of ore, the battery assays of which are \$16.05 a ton.

POTOSI.—The winze is down 24 feet below the 1300 level; bottom in porphyry. The north lateral drift, 1300 level, is out 237 feet; face in porphyry. East crosscut from winze, 1300 level, is out 150 feet. It has passed through 12 feet of quartz yielding low assays.

EXCHEQUER.—The east crosscut near the south line, 600 level, is out 291 feet; face in porphyry. East crosscut on the north line, 600 level, is out 65 feet; face in clay and quartz.

WARD COMBINATION.—The east drift from shaft, 1800 level, is out 820 feet; face in hard porphyry.

SILVER HILL.—Northeast drift, from the winze on 160 level, is out 625 feet; face in hard porphyry.

UTAH.—Northwest lateral drift from the main west drift from the shaft, has been extended 35 feet; total length, 494 feet, in a porphyry and clay formation.

NEW YORK.—East crosscut 100 feet north of shaft, 1000 level, is out 52 feet; face in clay and

quartz. East crosscut 200 feet north of shaft, 1100 level, is out 19 feet; face in porphyry. East crosscut 200 feet north of shaft, 1100 level, is out ten feet; face in clay and porphyry.

OCCIDENTAL.—During the week the work in the mine has been confined to repairing and retimbering the main tunnel to the 550 level.

SIERRA NEVADA.—Northwest drift from the shaft station, 630 level, has been extended 45 feet, total 451 feet; face in hard porphyry.

Jett District.

SENATOR.—Belmont *Courier*, Feb. 4: Thomas Warburton was at Jett, Nye county, last week and inspected his mines which are located in that district. He informs us that the Senator mine is looking splendid. The ledge goes down almost perpendicularly and it has already been followed a distance of 100 feet, and the vein is widening as depth is attained. Mr. Warburton brought to Belmont a few pounds of ore extracted from the Senator lode and had some of it assayed. Following is the result of the assay: Silver, per ton, 90 1/2 ounces; gold, \$3.25; lead, 43 per cent. It is well known that rich ore exists in that portion of the Toiyabe mountains, and whenever the American Congress decides to pass a Free-Coinsage bill, the owners of mines in that locality will undoubtedly resume work on their properties.

ARIZONA.

WALKER DISTRICT.—Prescott *Courier*, Feb. 6: N. L. Griffin is running the Dixie mill on gold ore that was once thought to be n. g. He makes this ore pay about \$8 a ton. He took out \$200 the first four days. Will crush richer ore as soon as he gets rid of the "waste" dump. A number of Frenchmen are mining good silver ore out of the Amulet. They have a lease.

BIG BUG DISTRICT.—Jack Owens has just taken a wagon-load of supplies to his mine in the above district. He told a friend that he had considerable ore that will mill between \$400 and \$500 a ton, gold. Other men say it will pay much better, but Jack is modest. Frank McCabe is shipping gold ore from his Gladstone mine. J. F. Blandy, M. E., arrived from Big Bug recently. From him we learn that the railroad is finished as far as Big Bug creek. It will not take the company long to send it to the Hackberry mine, and may be, farther. Two mills are being run in Hassayampa district, namely, the Senator and Rapid Transit. John McDonald, John Sugden, P. A. Craigie and other miners are working hard, with good success in the Slate Creek portion of the district. R. W. Groom, who has been mining in this county since 1864, has developed a group of mines near Wickenburg, which are well thought of. Mike Ryan, Tom Roach, John Holmes and others are raising shipping ore out of the Turkey Creek district mines. In Bradshaw, the Tiger and Crowned King are producing plenty of ore. Tip Top district miners ship from \$10,000 to \$25,000 worth of silver ore each month. We judge that Castle Creek miners are doing well, because some of them who recently went down to the capital were relieved of "rolls." Wagons with shipping ore are en route to the Prescott ore works from the Hillside country. Mines near Skull valley are panning out well. Mines near Cordes Station, Black Canyon road, are furnishing shipping ore. Water is not as plentiful as owners of hydraulic mines would have it, but they continue to harvest gold.

C O D.—Mohave *Miner*, Feb. 7: Steve Tyler was down from the C O D mine with a carload of ore from his lease. This ore was extracted by two men in a month and will run over \$100 per ton. This is a pretty good month's work and is a fair sample of returns to many chlorides operating in Mohave county. The Rip Van Winkle tunnel cut a great many small strings of rich ore, and the drift is now being run on ore rich in native and ruby silver, and considerable ore is being placed on the dump. The drift will soon be under the main ore body and then a number of men will be placed at work stopping. Work on the Last Resort mine near Mineral Park is progressing and much rich ore is being extracted. The streak of ore runs about four inches in width and yields about 2000 dollars to the ton in gold and silver. The south drift of the Indian Boy is in two feet of solid ore of a high grade. The ore is heavy lead carrying a good deal of gold and silver. Stopping will be commenced next week and the output of the mine will be increased to about two carloads of ore per week. The ore chute is about 80 feet in length and about 2 feet in width of solid ore. The ledge is the largest of any in the county, the crosscuts having encountered no walls.

SOME FINE ONYX.—Phoenix *Herald*, Feb. 6: Crowds gathered in front of Barnard's saloon to-day to see the wagon-load of onyx brought in from Woodson, Holmes & Barnard's recently-discovered mine at the head of Cave creek, about 50 miles south of Adjutant-General O'Neill's famous deposit. J. B. Braswell brought in the load, which comprised two large slabs, one 5 1/2 feet long, 12 inches wide and 14 inches thick. The two weighed 1700 pounds. A broad, green surface on the oval piece indicated that the genuine onyx had been found. It was so declared by Mr. Braswell's brother, an expert from Tennessee quarries. The owners have three claims located, embracing 20 acres each, out of which crops for 600 yards a ledge calculated to be 40 feet across. It dips into the mountain at an angle of 30 degrees. Charles Coon is fitting up polishing machinery and will manufacture commercial onyx as ordered from this ledge. A new road for six miles is needed to reach this property. Geo. W. Barnard will contribute liberally in onyx toward the expense of building it. Eight years ago Mr. Haydon surveyed an easy road grade through these claims. From Cave creek across Agua Fria is the only had part of the route. Thence to Prescott, taking in the Senator and other mines, there is not a single mountain to be crossed. The onyx claims of Woodson, Holmes & Barnard alone may induce railroad building just to reach those undoubtedly valuable deposits.

BRITISH COLUMBIA.

NOT EXAGGERATED.—Nelson *Miner*, Feb. 3: The reports from the Silver King are in no way exaggerated. The tunnel is in solid ore, that from the east wall assaying from \$200 to \$600 to the ton in silver. The face of the tunnel was sampled and gave a return of over \$100 to the ton. There is no question but that the ore-body through which the tunnel is now running is the same as that in the

crosscut from the shaft, as the shaft is now not more than 50 feet distant from the face of the tunnel. The crosscut was over 45 feet in length, with neither wall in sight, and the miners who put in the last shift unreservedly state that the ore blown out by the last shot was as good if not better than that previously taken out. The ore from the crosscut was shipped without sorting this fall, and if every man in the country is not a blundered liar, its value in silver and copper was \$414 to the ton.

COLORADO.

THE MOLLIE GIBSON.—Aspen *Times*, Feb. 6: The Mollie Gibson bonanza is increasing in importance as work progresses. The rich ore body on the fourth level is described as a wonder. It is from five to seven feet thick and grows with each day's development. Ten tons of the first-class ore sampled at Taylor & Brunton's yesterday returned 2200 ounces per ton. This includes all of the high-grade, the original plan of dividing it into two classes has been abandoned. The second-class ore runs about 700 ounces per ton, and there is a large quantity of this. Parties interested in the property begin to assert that it is destined to eclipse the Aspen. The value of the property does not depend entirely upon this rich chute in the fourth level, as the property would be a bonanza without it. Some weeks ago a body of good ore was opened in the third level south of the incline. During the past two or three days, this level has developed a large body of galena ore that runs high in silver. This chute is spoken of as being one of the most important features of the mine. The ore is rich enough to be very profitable, and is in such large quantity that it will furnish a heavy tonnage.

THE ROCK CREEK COUNTRY.—The Silver Crown has at last struck the contact through the big crosscut tunnel at a depth of 525 feet. Blue line has been encountered carrying considerable gray copper and of the same character as that found in seams on passing through the porphyry footwall, which gave assay returns of 800 ounces silver. William Newman is pushing work on the Caledonia and High Tower crosscut tunnel and is now in a depth of 115 feet. Considerable mineral is being found, though shaken up and out of place. It is estimated that another 100 feet will cut the contact carrying the rich mineral found in the old workings of the Acme and Leviathan which gave assays of 5000 ounces silver. The Hecla is another valuable group and embraces the Hecla, Calumet, Aspen, 1890, Log Cabin, and Big Four claims. It is owned by O. H. Schen, J. E. Chaney and others, and is being worked by a crosscut tunnel now in a distance of 200 feet, and it will be necessary to drift 200 feet farther to cut the big contact that swings across the gulch to the north, opposite Newman mountain on Breese hill. Indications point to a busy and prosperous season for Avalanche, Newman mountain and vicinity, and good paying mines are things to be expected in the near future.

IDAHO.

BIG MUDDY.—World, Feb. 7: Wm. Sweet has got in timbers and is otherwise prepared for carrying on work uninterruptedly on one of the group of mines at the head of Big Muddy. Mr. Sweet has begun the work of sinking a shaft. He will go to the depth of two or three hundred feet, and with this development he will determine whether it will be good policy to tap the mines at great depth from Payette side. If the mine continues down as it is at the surface, a tunnel will be run to tap the ledge at the depth of 800 or 1000 feet. The Elmira Co., at Banner, has turned out 170,000 ounces of silver in the last 170 days. Their mill is a ten-stamp.

QUEEN OF THE HILLS.—Salt Lake *Tribune*, Feb. 5: Fulton Haight, superintendent of the Queen of the Hills mine, Bellevue, Idaho, is in the city. Regarding the Queen of the Hills, he says they are employing 30 men in doing development work chiefly. Drilling is being done on the vein at a point 400 feet below the Lusk, or working tunnel. About 400 feet of drifting has been done on the vein at that depth, besides many crosscuts to explore the country. The mine is looking well. The Minnie Moore is being worked by leasers, some 15 or 20 men being engaged, and they are doing well. Water in the mine has risen above the 500-foot level. "I learn," said Mr. Haight, "that the Modoc is looking fine, and ore is being extracted and shipped." On the Michigan vein is being drifted upon at the 366-foot level and is looking very promising, there being considerable iron in the vein. The Hillside is a new mine near the Modoc, and it is being worked by leasers who are taking out ore that runs about 100 ounces silver and 60 to 70 per cent lead. There are two or three promising prospects at the head of the Minnie Moore gulch which are being developed by their owners. Several other good prospects about Bellevue promise to develop into mines soon. Mr. Haight said he knew but little of the mines in other parts of Wood River, but he understood that the Red Elephant, being worked by Colonel Byron, and the Red Cloud were doing nicely, and that the Idaho Democrat, being worked by J. O. Swift, is promising well. "How about the raise in freights?" asked the reporter; "how is it going to affect that country?" "The raise amounts to nearly \$5 per ton in the way of increased freight and other charges, and this is enough to injure the country very much, if it does not cause the shutting down of the mines."

MONTANA.

EIGHT HOURS.—Butte *Inter-Mountain*, Feb. 4: The miners of this camp are still interested in the 8-hour proposition and it still forms a popular topic of conversation with them. From the first they have been disposed to treat the subject in a most conservative manner, and that disposition is still to be seen in the manner of their discussions. There is no thought of forcing the new measure, but hope seems to be that its wisdom may be acknowledged, and so much of a concession made without anything like agitation. Since the Legislature has been organized they have been hoping that a law may be passed granting them at least a measure of relief, but the steps to bring that about have been so quietly taken that really little is known regarding their action outside of the order. The practice with the Anaconda Co. is to work the men ten hours on day shift and nine hours at night. On Saturday nights they are given one hour as sort of

partial holiday. In a general way this plan is followed by most of the big companies, some of them giving more and some less of the Saturday night. The Saturday day shift in most of the mines is remembered with the gift of an hour or at least with some extra time. It is understood that the presidents of the Butte and Granite Miners' Unions are in Helena looking after the matter of legislation, and that they hope to obtain some relief before the winter is out. Another matter that is being discussed among these hardy underground workers is making the office of mining inspector elective. This measure has many friends and will doubtless be brought forward for consideration before spring.

THE BOSTON & MONTANA.—The forces employed in the mines of the Boston & Montana Co. have been reduced during the past week to some extent. These mines have been developed to such an extent that it is stated the Mountain View alone has ore sufficient in sight capable of keeping the present hoisting plant busy for a period of ten years without interruption or further development. All now depends on the completion of the large smelter at Great Falls, when work on all of these great mines will resume on a basis never before experienced in the history of this camp.

THE EMMA NEVADA was visited during the past week by President Brophy, accompanied by Messrs. Largey and Hellican. The main tunnel is in 200 feet, and on the pay chute a distance of 80 feet. They report a high grade of chloride ore, several samples of which are on exhibition at the office of Rickards & Lewis, West Granite street. It assays 1000 ounces in silver and \$18 in gold. The lead from which this rich ore comes runs from 4 to 18 inches in width. The north ledge which is worked from the bottom of the 50-foot shaft runs in the bed of the creek and is from six to eight feet in width. From it several cars of rock have been shipped to this city for reduction. The level from the bottom of the 58-foot shaft is in 132 feet, 98 feet of which is in pay ore.

UTAH.

A FORTY-THOUSAND-DOLLAR SALE.—Salt Lake *Tribune*, Feb. 7: George S. Smith and wife have sold to John A. Van Pelt the Extension and other mining claims in West Mountain mining district for \$40,000. The deed went on record yesterday.

TINTIC AND THE U. P. GROUP.—John F. Stringer has returned from a visit to Tintic, where he took a look at the Union Pacific group and the Iron Duke. In the Union Pacific group a tunnel is being run in on the Young Miner claim, and has reached a distance of about 80 feet, getting to a depth of about 50 feet below the surface. The ore found there assayed 25 per cent lead and about 60 ounces silver. This is in porphyry, but there are indications that limestone is not far off. This is believed from the fact that in the tunnel there are cracks crossing in which the sides are coated with lime crystals. The company has a carload of ore in the bin which will run about \$80 a ton. The Iron Duke is improving as work pushes ahead, and the streak of ore is widening until the pay is now two feet wide and assays about \$50 per ton. Mr. Stringer said he had to sleep in an orehouse one night because there was no other accommodation in Silver City which had not been taken, but this state of affairs will not last more than ten days longer, because the hotel building by Condon Bros. will be open by that time, which will certainly be an important event for that portion of Tintic district.

AT CAMP FLOYD.—Salt Lake *Journal*, Feb. 7: From Mr. R. L. Scannell, secretary of the Mercur Gold Mining and Milling Co., whose works and mines are located in the Camp Floyd mining district, we learn that it is the intention of the company to start their mill in a week or two, or as soon as the weather will permit. The character of the ore in this mine is red oxide of mercury, and yields, on an average, assays of from \$20 to \$37 in gold to the ton. The magnitude and wealth of this property can be somewhat appreciated by the statement that the extent of the ore body has not yet been determined. The shaft is down some distance in solid ore, several drifts have been made without reaching the limit, and the miners are now working in a tunnel, that is in a distance of 300 feet, all the way in solid ore. Thus it can be seen that, although the ore is low grade, it is an enormous proposition, especially when it is remembered that, besides the gold, quite a large per cent of quicksilver will be saved in the reduction of the ore. There are now a thousand tons of ore at the dump at the mine, and the ore-bins at the mill are full. The milling is novel and exhibits some new features in ore reduction.

WASHINGTON.

CONCONULLY.—Okanogan *Outlook*, Feb. 7: The coming season promises to be one of much greater activity than any yet experienced in the camp, and the mild, open winter we are having will have the effect of commencing operations about two months earlier than last season. A change for the better is already noticeable in the number of sales of mining and other properties recently made, and on all sides active preparations are being made for the employment of increased development forces and the opening of new mines. Jack Waters sold one of his Lime Belt prospects to Geo. Pfunder this week. F. S. Hinds and Geo. Cooper started a new drift on the Okanogan Belle this week. Henry Lawrence and Wm. Hunt went up on Mineral Hill the first of the week to commence work on the Mohawk. Ben Gubser has been working in the tunnel on the Trade Dollar claim, just above town, for the past two weeks and is taking out some very good-looking ore. Geo. Pfunder is said to have secured a bond on some valuable mining property in the Wanacut Lake district. Wm. O'Neill visited Palmer mountain this week and reports that miners and prospectors are hopeful and confident of a season of activity in mining operations in that district, and not a few are getting in shape for a big season's work. While on the mountain he visited the Leadville mine, on which John Judge, the owner, is doing some development work. A shaft is being sunk on the vein and is now down 20 feet. The ledge thus exposed has increased in width from two feet at the surface to four feet at the bottom of the shaft. Some of the richest gold ore ever found in the camp has been taken out of this shaft, and the mine is considered one of the best properties in the district.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEB. 3, 1891.

445,742.—SHINGLE AND SHAKE MACHINE.—Chas. W. Babcock, Crescent City, Cal.
445,828.—SEPARATING CROSS-HEAD TIE-WIRES.—G. B. Baer, Cloverdale, Cal.
445,747.—STRIKING BAG.—H. B. Cook, S. F.
445,750.—LETTERING DEVICE.—L. A. Gates, S. F.
445,729.—STOVE TOP.—Peter Haerst, S. F.
445,892.—WATER-CLOSET.—J. M. Holloway, Santa Barbara, Cal.
445,753.—FRUIT-PITTER.—James T. Ish, S. F.
445,837.—PNEUMATIC BELL.—G. F. Kincaid, S. F.
445,730.—AX-HELVE FASTENER.—H. M. Martin, Tacoma, Wash.
445,818.—SHEAVE.—Thomas O'Neill, S. F.
445,910.—ELASTIC FENDER FOR VESSELS.—G. O. Stein, Pioche, Nev.
445,856.—CLOTHES-HANGER.—E. Sundberg, Eureka, Cal.
445,612.—SELF-CLOSING GAS BURNER.—W. Ten Eyck, Oakland, Cal.
445,579.—VAGINAL ATOMIZER.—W. E. Weldon, S. F.
18,930.—TRADEMARK.—R. D. Hume, S. F.

The following brief list by telegraph for Feb. 10, will appear more complete on receipt of mail advices:
California.—Lewis M. Clement, Oakland, cable street railway; Julia W. Craig, San Francisco, chair; Peter H. Jackson, San Francisco, lens for illuminating tile; Ammi M. Jewell, San Francisco, boring machine; Edwin McDonald, Wilows, thrashing machine; James F. Waite, San Francisco (assignor of half to William Hollis), brake for cable-car.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS-U. S. and Foreign Patent Agency, the following are worthy of special mention:

STRIKING-BAG.—Hiram B. Cook, S. F. No. 445,747. Dated Feb. 3, 1891. Striking or exercising bags are usually made with an outside case of leather and either filled or comparatively heavy or with an inner rubber bag having a pipe or tube by which the bag may be inflated so as to fill the exterior case, making either a heavy or a light bag which is suspended by a cord from the ceiling in such a position that the operator can strike the bag, causing it to swing, and as it returns or rebounds to strike it again, and in this manner use it for exercising purposes. The exterior cases as usually constructed are made of seven or eight segments, the edges of which are stitched together and they are provided with a loop or strap stitched upon one side to which a cord is attached so that they may be suspended from the ceiling. A swivel hook forms the connection between the upper end of the suspending strap and a hook or eyebolt which is screwed into the ceiling, the swivel necessarily hanging some distance below the fixed hook and swinging as the bag swings. By this construction, when the bag is struck the swivel swings up against the ceiling, making considerable noise and in time wearing the ceiling out, besides which the eye-bolt very soon becomes loose and a new hole has to be made for it. The strap to which the cord is attached being secured at only one or two points, pulls the bag out of shape and is also soon torn loose from the bag by the violent wrenches upon it, and when the seams in the bag become ripped, as they soon do, it is very difficult to repair them. In Mr. Cook's invention the bag is made preferably in four sections and these sections have their edges cut so as to abut squarely against each other and they are then sewed together by an over-and-over seam which leaves the edges abutting squarely so that both outside and inside of the bag are perfectly smooth. This prevents the rapid wearing out of the interior rubber bag when one is used and presents a smooth surface upon the exterior for the hands to strike against. Each section has a strap riveted into the end of the section and a re-enforce of leather is stitched down over them. These suspending straps pass out through slots in this re-enforcing piece and the ends are all brought together centrally and firmly secured to the suspending cord. By this construction each of the sections has an equal strain brought upon it and each section is equally secured and suspended, and when used with the rubber bag they form a space between them within which the tube for inflating the rubber bag is safely protected. The eye-bolt to which the upper end of the suspending cord is attached has its shank extending vertically through a fixed countersunk plate with a nut or head upon the inner end whereby the eye is allowed to turn freely. The point of motion is thus brought close to the ceiling and no swivel is necessary. There is no noise caused by the swinging of a swivel against the ceiling. The bag and cord move together, and as there is no weight of iron at the upper end of the rope to swing with the bag, the motion of the latter is made more smooth and even and the life of all the parts is greatly extended.

STOVE-TOP.—Peter Haerst, S. F. No. 445,729. Dated Feb. 3, 1891. This improvement in stoves consists in a rotary disk or plate through which the holes are made for the utensils which are used upon the top of the stove—this plate being capable of revolution around a vertical axis so as to bring either of the holes to the front or rear to change the position of the utensils with relation to the fire. It also consists in a means for closing either of the holes temporarily from beneath while a utensil is being removed so as to prevent the escape of smoke and products of combustion.

SHINGLE OR SHAKE MACHINE.—Chas. W. Babcock, Crescent City, No. 445,742. Dated Feb. 3, 1891. The object of this invention is to provide a machine for operating upon two bolts, one on each side of the machine.

MECHANICAL PROGRESS

The Demand for Power.

Statistics show that four-fifths of the total horse-power of the steam engines now in operation has been produced in the last 25 years. Although the increase has been considerable in this short time, it is not to be wondered at if a little thought is given to some of the conditions that have made it possible, principally the larger extent of country that has been opened up during this time and the increased facilities for doing business that have been introduced. As the efficiency of engines and boilers has been increased, the cost of operating them has been reduced to such an extent as to make them available in many places where a more expensive motor power would leave no margin for profit, and consequently no occasion for the opening of a business. The facilities for doing business have been increased in even greater proportion in the same length of time, and that of itself has called for increased power for the development of natural resources and the products of the manufacturer. There will always be a large demand for all things which are or may be made useful, and any improvement that will cheapen the cost will be the means of creating an increased demand as it is brought within the reach of a greater number.

Many things that were formerly made by hand are now manufactured by machinery, and the operation of machinery requires power. As natural sources of power are not always conveniently located, transformers of power are found more convenient and far more reliable, so that by their use the factory can be located in any desirable position and the power brought to the factory. This has been found the cheapest and most reliable method, for where the power is under control it can be relied on at all times, but the same cannot be said of the natural powers, for they have a faculty of falling below the requirements just at the time when the use for them is greatest. This has been shown in the use of water-power for milling purposes. Most of the leading mills have introduced engines and boilers, even when located near some of the best water-powers.

Competition and an increase of business has made the use of reliable power an absolute necessity, and steam has been the only thing available. In some cases it has been found that steam, when used in connection with a high-duty engine, was, taken altogether, the cheapest source of power, and the spectacle has been witnessed of a mill fitted with water-power machinery, built over a race through which an abundant supply of water was running to waste, while the mill was being operated by steam.

The Use of Electricity.

Then the introduction of electric lighting and the use of the electric current for the production of power, has created an increased demand for steam engines; and the fact still remains that the cheapest and most convenient method of producing electricity (when water-power is not available for that purpose) is by the use of the steam engine. The rapidly-increasing use of electricity for power purposes only increases the demand for steam engines of larger size and greater power, and the electric motor being cheaper, more convenient and less troublesome than small engines, is being introduced in many places where it would be impossible to establish a satisfactory steam plant. Then every electric motor put to service will require for every horse-power that it develops very nearly two-horse-power of steam engine to operate it, so that from present appearances there is little probability that the demand for steam engines will perceptibly decrease; but on the contrary, another 25 years will probably show as great an increase over the present as the last 25 years have shown. Even though some of the wonderful methods of producing electricity, that have been heralded lately, should be made practical, the steam engine would still be in demand.—*Stationary Engineer.*

FORGING STEEL BY HYDRAULIC POWER.

Hydraulic forging presses are now in operation all over Europe, and are effecting a complete revolution in the working of large masses of steel. What used to be considered wonderful results in the forging of iron by means of the Neumath hammer, are now quite put in the shade by the hydraulic forging presses of immense power produced at the Goodman-street Engineering Works in Leeds, whence was provided, not very long ago, the first large forging press that ever was made, and which is now in full work at the armor-plate manufactory in Sheffield, of Messrs. John Brown & Co. It is of 4000 tons, and is worked by 2000 horse-power pumping engines, and commanded by power-traveling cranes capable of lifting 150 tons. At the works of Herr Knapp, and at those of Schneider & Co., in France, similar presses are now at work, and one has been erected at the Terni works in Italy, whence the forging of guns and armor-plates is largely carried on. A 4000 ton press, ordered by a Châtillon company, has been delivered, and is now in course of erection by the Leeds firm. As showing how widely the use of hydraulic power is being adopted, because of its vast capability, it may be mentioned that Tannett, Walker & Co., of Leeds, are putting down for

the Midland Railway Co., at their goods stations in Birmingham and Leeds (both of which are undergoing large extensions), a hydraulic plant whereby more facility than heretofore will be obtained to deal with the immensely increasing traffic.—*London Iron.*

HAMMERING is a wonderful process. It is an ingenious and simple means of exerting a great force in any direction, and without it many arts would cease; but it is carried too far in iron-forging. Hammering is suitable only in cases where the work is to be done "quick," and this does not apply to the heavy forgings of our time, and to no forgings, if we could employ presses instead. A steel-making firm in England is about to put down a press of enormous capacity. The tool-makers have to make certain parts on the ground, because they cannot be transported. One piece weighs 85 tons. Cammel, at Sheffield, has a press of 45,000 tons capacity that has been in use about four years doing good work. In hammering heavy masses, the inertia of the piece prevents any effect on the anvil side, and also penetration on the top side, unless the hammer is heavier than the work.—*Industry.*

SHEET IRON MOUNTING FOR BLUE PRINTS.—A well-known Eastern manufacturing company is using in its shop thin sheet iron as a mounting for blue prints, and it is proving very satisfactory. It is cold rolled, has a smooth surface, and is cut into two different sizes for blue prints used in the shop. It is practically indestructible, quite light, and inexpensive. The iron is first varnished on both sides with shellac varnish, then the blue print is put on with a paste composed of ordinary starch, after which the face of the print is varnished with the shellac. The chief draftsman says he experimented with a good many kinds of paste before finding a satisfactory one, and that starch is the only thing found that would answer. He also found that, unless the iron is previously varnished, it oxidizes under the print and spoils the lines.

THE MANNESMAN PROCESS.—Our contemporary, *Industry*, of this city, comments as follows on the Mannesman process of rolling tubes: This process, unless a good deal changed, will, in our opinion, prove more interesting than useful. The enormous resistance offered by the blank in its passage through the rolls may be overcome by storing up power in wire-bound fly-wheels, but how are the rolls, gearing and framing to endure under the strains? Not only has the roll gearing to withstand abnormal strain, but must be yielding in two planes. The ordinary processes of rolling metal, hot and cold, with parallel rolls, taxes the endurance of bearings, gearing and framing to their utmost; and to double this and at the same time increase the speed to 300 revolutions per minute, is going beyond a practical limit.

ENGLISH OR AMERICAN STEEL?—English sois are still called for by ladies, but tailors and others using scissors in their daily work have long since ceased to look for the Sheffield mark. This is very significant, and the fact that an English tailor insists on American-made shears is a great clue upon us, as the very best article is needed in cutting out garments. Ten years ago English sois brought double an apparently similar article of American make. Now the most costly shears in these days are of American manufacture, and every year a greater quantity of them is being imported. It is the boast of an American house that they ship shears regularly to Sheffield, and by so doing discount the oft-repeated story and fable about "shipping coals to Newcastle."—*London Machinery.*

ELECTRICITY IN PRESSING METALS.—Some experiments have been made in heating metal to a plastic state by electricity and then pressing it into shape with dies. Good results are obtained, but we doubt if the heating will not cost a great deal more than by direct fire. Gen. B. C. and R. A. Tilghman, of Philadelphia, made some time ago experiments to determine whether surplus metal could not be removed by rendering it plastic with a current passed through an abrading wheel, operating like an emery-wheel. The results, so far as we know, have not passed beyond Messrs. Tilghman's laboratory.

CASE HARDENING.—Prof. Elhn Thompson has recently devised a method of case-hardening iron or steel by means of the heat produced by the passage of an electric current. The process consists essentially in heating the object electrically and then applying to it a surrounding envelop—either gaseous, fluid or solid—for the purpose of changing or preserving the quality of the metal in accordance with the desired use of the material.

A PRACTICAL WAY.—A Worcester (Mass.) mechanic gives the following method of hardening any tool, which he has employed for some years: Forge the tool into shape, then melt in a dish sufficient babbit metal to cover the end of the tool as far as it is wished to harden it. Thrust the tool into the metal and let it cool. This will render any tool much harder than when cooled in oil or tempered by any other process.

QUALITY, efficiency and adaptability are vital considerations in selecting machinery.

SCIENTIFIC PROGRESS.

The Seisephone.

An Instrument to Detect Internal Flaws in Metal.

We have already in a previous issue made brief allusion to this invention and to its usefulness. We now give a fuller description of the instrument, its mode of use and several crucial tests which have recently been made to prove its reliability. We quote from *London Iron* as follows:

The importance, both in mechanical and civil engineering construction, of having metal free from internal flaws has always been recognized, and so has the difficulty of detecting them. We appear, however, to be approaching a solution of this difficulty by means of the seiseophone, which is the invention of Capt. de Place of Paris. This apparatus consists of a small pneumatic tapper worked by the hand, and with which the piece of steel or iron to be tested is tapped all over. Connected with the tapper is a telephone with a microphone interposed in the circuit. Two operators are required, one to apply the tapper and the other to listen through the telephone to the sounds produced. These operators, who are in electrical communication, are in separate apartments, so that the direct sounds of the taps may not disturb the listener, whose province it is to detect flaws. In applying the system, one operator places the telephone to his ear, and so long as the sounds produced by the taps are normal, he does nothing. Directly a false sound—which is very distinct from the normal sound—is heard, he instantly signals for the spot to be marked. By this means he is able not only to detect a flaw but to localize it.

Under the auspices of the Southeastern Railway Company, a demonstration of the seiseophone was given on Wednesday by Capt. de Place at the Charing Cross Hotel, in the presence of several members of the Ordnance Committee and other government officials. Mr. Stirling, the company's locomotive superintendent, had previously had several samples of steel, wrought iron, and cast iron prepared with hidden flaws known only to himself. The first sample tested was a portion of a railway carriage axle, which Capt. de Place pronounced to be had metal throughout, and which Mr. Stirling said he knew it to be. Other samples, consisting of bars of wrought and cast iron, one inch square, were tested, and the flaws localized by means of the apparatus. On breaking some of the bars, the internal flaws—the localities of which were known to Mr. Stirling by his private mark—were found to have been correctly localized by Capt. de Place. We must, however, record the fact that other bars were broken at points where the apparatus indicated a flaw, but where the metal was found to be perfectly sound. Some allowance should, perhaps, be made for Capt. de Place being subject to the disturbing influence of visitors. However this may be, the system does not as yet appear to be practically reliable, although we do not despair of its ingenious inventor being able to make it so.

THE SCIENCE OF METEOROLOGY is by no means an exact science as yet, but there is a steady gain toward exactness. Many problems which seemed insoluble a few years ago have been satisfactorily answered, and many more are being solved with favorable prospects of being determined before very long. As observation stations are multiplied and more data for calculations furnished, the chances of securing better results will be increased, and the predictions will be of more and more value. We are taught, says a contemporary, that the wind bloweth where it listeth, and whence it comes or whither it goes no man knoweth; but the weather bureau has undertaken to find out not only whence the wind comes but why it comes and when it may be looked for. To accomplish this must require the patient labor and incessant observation and study of years, and we should rather be grateful for what has been accomplished than displeased because perfection has not been attained. If any one will keep tally on the weather predictions for two or three months, he will be surprised to find that the bureau is right a great many more times than wrong, and that there is certainly something of value in the system which it has adopted and is trying to make more nearly perfect.

INTERIOR TEMPERATURE OF THE EARTH.—It is common to assume that the temperature of the earth toward the center increases one degree for every 60 feet in depth. This, however, is far from being universally the case. It does not hold good in California, nor in the Sierra Nevada mountains. At Virginia, Nevada, in the Comstock mines, the temperature in some cases increased one degree for each 20 feet up to 1000 feet in depth, or for 2500 feet, one degree for each 30.5 feet—twice as fast as the rule first named. At Manchester, England, in a shaft 2500 feet deep, the temperature is only 75°. In a copper mine at Cornwall, 2100 feet deep, the temperature is 88°. Subtracting 42° for the surface temperature, this makes in the first case a change of one degree in 65 feet, and in the second, one degree in 45.6 feet, from which it may be inferred there is no uniformity in the matter, consequently no rule.

REMOVING ODOR OF SULPHIDE OF CARBON.—Sulphide of carbon is an important substance

for many industrial purposes, but its disagreeable odor is very much in the way of its extensive employment. Quite lately a method has been devised for removing the odor which is said to accomplish its object. To effect this, it is first to be shaken up with one per cent of corrosive sublimate, this operation being repeated several times, after longer or shorter intervals. In this way certain sulphurets are produced, which cause the salt of the mercury to turn black. The liquid is then to be distilled, and that which passes over will have a much less disagreeable smell. If one-third of its bulk of the oil of almonds be added, the result is very satisfactory. The sulphide, under these circumstances, emits a pleasant odor, somewhat like that of ether.

Drugs and Fruit in Common Coal.

Very few people have any idea of the almost numberless products of common coal, and least of all that essence of fruits, drugs, and even wines are found in the ordinary, every-day fuel of the time. Yet such is the fact; coal has many uses beyond the mere giving of heat and light. These last have only been discovered of late years, although pitcoal has been known hundreds of years. Even illuminating gas was unknown a century ago, petroleum has been in use scarcely 40 years, and it is hardly more than 50 since some one discovered that stone coal was inflammable. Nearly all other products derived from soft coal have been discovered and applied in the interest of science or of fraud within the last 25 years. Some of them seem almost magical.

Besides heat and light, there are obtained from ordinary coal the means of producing over 400 shades of colors, among the chief of which are saffron, violet-blue and indigo. There are also obtained a great variety of perfumes—cinamon, bitter almonds, queen of the meadows, clover, wintergreen, anise, camphor, thymol (a new French odor), vaniline and heliotropine.

Among the explosive agents whose discovery has been caused by the war spirit of the last few years in Europe are two, called dinitrobenzene or hellite and pitrates.

To medicine, coal has given hypnone, salicylic acid, naphthol, phenol antipyrine—the last a remedy for "La Grippe." Benzene and naphthalene are powerful insecticides.

There have been found in it ammoniacal salts useful as fertilizers, tannin, saccharin (a substitute for sugar), the flavor of currant, raspberry and pepper, pyrogallol acid and hydroquinone, used in photography, and various substances familiar or unfamiliar, such as tarsine, asphaltum, lubricating oils, varnish, and the bitter taste of beer. By means of some of these we can have wine without the juice of the grapes, beer without malt, preserves without either fruit or sugar, perfumes without flowers, and coloring matter without the vegetable or animal substances from which they have hitherto been chiefly derived. So it will be seen that coal is an exceedingly versatile commodity.—*Ex.*

CHANGES IN THE TERRESTRIAL AXIS.—At the autumn meeting of the International Conference on Degree Measurement lately held at Freiburg, it was reported that a series of simultaneous observations carried on at Berlin, Strasbourg and Prague, showed that a decrease in latitude was in progress, at least in middle Europe, and a similar phenomenon had been noted in other places in Europe. This implied an alteration in the direction of the earth's axis; that is, the poles and equator, latitude and longitude, are not, as usually assumed, practically fixed data. The amount of ascertained decrease of latitude at the end of the six months' period from August, 1889, to February, 1890, was half a second. It was stated at the conference that the Berlin observations for the half year ending last August showed an increase of latitude amounting to 0.4, or two-fifths of a second. The fluctuation of the axis is thus due to a minute oscillation, probably owing to some changes in the internal mass of our planet, and not to be confounded with the precession of the equinoxes.

CONTROLLING SEX IN BUTTERFLIES.—A suggestive article as to the possibility of controlling sexes in butterflies has been communicated to the *American Naturalist* by Mrs. Mary Treat, and from the results of numerous experiments she finds occasion to believe that the larva to which the freshest and most tempting food was supplied in unlimited quantity nearly always developed into female butterflies, while those for which the supply of food was limited, almost as uniformly proved to be males. Dr. Packard is, however, inclined to think that the sex of this insect, as well as that of all animals from eggs, is determined at or about the time of conception, or, at least, early in the embryonic condition. In the honey-bee, especially, it has been proved that the sex is decided at the time the egg leaves the oviduct. The sex in man, according to Koelliker, becomes fixed toward the end of the second month of fetal life.

PLATE GLASS.—There are at least six plate-glass manufacturing companies in the United States which have an annual product of nearly 12,000,000 feet. This exceeds the entire production of Europe fifteen years ago.

DANISH EXPERIMENTS with armor plates have confirmed the result arrived at by the United States experts at Annapolis,

GOOD HEALTH.

The San Francisco Cancer Cure.

The fearfully rapid increase of cancer in all parts of the world, and on the Pacific Coast in particular, seems just at this time, in connection with the world-famous German cure for consumption, to be calling more than usual attention to the allged cure for cancer which has been kept hitherto from the people of this city and State for some three or four years past.

Go and See for Yourselves.

The specialist in question works with open doors, and may be found every week-day at 224 Post street, where any physician or other individual personally interested is invited to call between the hours of 10 and 12 A. M. During this time they can witness the mode and manner of treatment, examine and converse with patients, and have at the same time free access to all the remedies. These latter are perfectly harmless in character, and none of them contain any caustic, poison or mineral. The regular faculty, as a general rule, makes use of minerals more or less poisonous in character in their efforts to treat cancer otherwise than with the knife. It is

A Sad Commentary on the Healing Art.

And on the humanity of our physicians, that so few of that profession will take any pains to inform themselves in regard to this matter which is of such great importance to the health and lives of our people.

The piteous and despairing wails that daily go up from hundreds of suffering cancer beds in this city alone are calling loudly on the people of San Francisco to take some energetic step to secure a thorough and searching investigation into the truth or falsity of this alleged remedy. We hold that the array of evidence, positive in its character, is more than sufficient for the purpose of a positive instruction to our city or State Board of Health to inquire into the matter and report whether it is true or false. If true, the fact should be made known officially; if false, that fact should be made known so that the growing excitement in San Francisco should be allayed at once.

Several physicians and many citizens not heretofore interested in this inquiry are now looking into the matter with much interest. There are upward of 20 patients now under treatment, nearly all of whom have come from physicians of repute who have pronounced their cases cancer. All are apparently doing well. Of the entire number, not more than two or three are considered in any danger. Two or three of those doing well have been pronounced typical cases of scirrhus by several of our city physicians and others, several of whom are watching these particular cases with special interest.

Why do our leading doctors devote so much time to experimenting with the secret consumption cure which comes from Berlin, the curative virtue of which has not been thus far proven in a single case, while scores of cases of positive cure of a far worse malady than consumption can be shown in our own city of San Francisco, which are altogether ignored by these very same physicians. Is it because the former comes from a *protege* of royalty—from an imperial palace, while the other has been born of a humble searcher for truth in a plebeian San Francisco dwelling?

Both are secret remedies. The one has already secured a princely fortune in gold, even before a single cure is known to have been effected, in addition to which imperial honors have been showered upon him without stint. If time shall prove that his discovery is what it is represented to be, he has not been overpaid for what he has done for humanity.

Our own specialist is simply waiting for the same medical investigation which has been accorded to the Berlin specialist. Something in the way of compensation will of course be expected before the remedies will be given to the world. That compensation will be secured as soon as medical evidence is obtained that the remedies are what they are claimed to be; until then, nothing is expected.

Prof. Tyndall in a recent letter on the subject of cancer-curing, writes: "I would give a great deal to know something fundamentally true regarding the various phases of the terrible malady to which you refer. Some, indeed, among those near and dear to myself have been subjected to the surgeon's knife with a view to its extirpation. . . . This I do know of a certainty, that there are scores of scientific men, of the profoundest knowledge and the soundest judgment, who would willingly risk their lives in the attempt to extirpate cancer. The scientific journals of the world are open to him. These are the tribunals to which his claims ought to be referred." This is precisely what has been done in San Francisco. Failing to interest the medical profession when we first began to inquire into Dr. Cook's treatment, we were forced to place the matter before the public in a series of articles in the MINING AND SCIENTIFIC PRESS. These articles and cases have been produced in pamphlet form and have been widely circulated, with the result of drawing a large amount of attention to the subject, both that of professional and non-professional readers, of those who have been afflicted with the direful malady, or of those whose friends have been given over to a lingering and torturing death.

Our challenge to the medical profession has

been so far disregarded, and our appeal for a skilled and scientific investigation has been denied. We hope for better results in the future. In the meantime we assert that it has now become essentially the people's question, and to them we now appeal. Surgeons are powerless, and can do nothing but out away the growth, to have it return with tenfold virulence, and then resort to morphia to deaden pain. This is the Alpha and Omega of the profession in its treatment of cancer.

SHOP NOTES.

A SENSIBLE HINT FROM A PRACTICAL SOURCE. The value to the mechanic of good periodicals and papers pertaining to the business in which he is engaged, is often underrated by him, and he is apt to consider that he is none the worse for a lack of knowledge about the experience, opinions and work of others. This, says the *Master Mechanic*, is a most serious mistake on his part, and one which in the end will be suicidal to his best interests. One great reason why so much progress has been made in recent years lies in the fact that the ease with which men can give the results of their labors and experience to their contemporaries, or leave them to posterity, has resulted in a much greater diffusion of knowledge. In the mechanical field this circulation of knowledge has enlarged and is still enlarging the circle of men who are well posted and fully alive to all that is going on. How then can a man neglect those very means of advancement by which others are progressing? It matters not whether he be a fireman, engineer, machinist, foreman, master mechanic, or superintendent of motive-power, or whether his natural abilities be great or small, if he wishes to advance with the rest of the world, he must know what it is doing, and this knowledge must be derived from the pages of papers devoted to mechanical affairs. There are many young men who would be glad to get such reading, but who may not be able to pay for it, and there are others without any desire for it who would wake up to a realization of the possibilities in life before them if their views were enlarged. For these reasons a man is to be highly commended for putting into the hands of those in his employ good engineering and mechanical journals, but he is not true to his own interests if he himself neglects to read them.

THE ANNEALING OF TOOLS.—Some tools, such as circular cutters, files, etc., after they are forged into the shape required, must have teeth cut into them. Before this can be successfully accomplished, a preliminary process is necessary. Hammering or forging the steel into the shape required will have hardened the steel to such an extent as to make the cutting of teeth into it impossible or difficult. It must, consequently, be annealed. This process is a double one. The steel must be reheated as carefully as before, and afterward cooled as slowly as possible. Many tools are only required to be hardened on a small part of their surface, and it is important that the unhardened parts should possess the maximum amount of toughness with the minimum amount of brittleness that can be attained. These tools can also be annealed after they are forged. The process of annealing, or slow cooling, leaves the steel cross-grained, gives it its maximum of ductility, and causes it, in fact, to approach the properties of lead.—*The Ironmonger (London).*

SHOP DUST.—Operators in wood-working establishments are necessarily subjected to the unpleasant and unwholesome effects of dust, and in planing-mills and similar establishments it seems to be impossible to escape this nuisance. Modern shops are supplied with machines for carrying away much of the dust and shavings made by wood-working machinery, but even in the best-equipped shops the workers are obliged to inhale more dust than is wholesome. Planing-mill, sawmill and furniture factory operatives, and in fact all men who work in wood, have a peculiar appearance that is the result of inhaling wood dust. An observer would never mistake an old planing mill operator for a worker in a machine shop. Each bears in his face and general appearance the marks of his occupation.

THE FOREMAN of a shop can only form an opinion of what any one can do by the work he has done; if he is careless the work will show it, and show him up to his disadvantage. The workman who thinks he is the one who can be depended upon, but the non-thinker is "cheap help," and as such must take the chances. The workman who thinks of what he is doing, and of how to do it to the best advantage, is not the one who is always "getting no show," nor is he always complaining of hard times. The boy or man who does all he can, as well as he can, will very soon get better work, for it is to the foreman's interest to have each workman work on the best job he is capable of doing.

THE LARGEST CASTING EVER MADE.—A telegram from the East, dated Bethlehem, Pa., Jan. 31st, says: Engineer-in-Chief Melville and Lieutenants McElwain and Perry, United States Navy, witnessed the pouring of 75,000 pounds of casting for the manufacture of Government armor and plates at the Bethlehem Iron Company's ordnance works this afternoon. The casting is the largest ever made.

USEFUL INFORMATION.

An Artificial Earthquake.

The citizens of San Francisco, as if the natural throes of Mother Earth were not of sufficiently frequent occurrence to satisfy their taste for such pastimes, were treated to quite a large artificial shaka by the explosion of a large quantity of giant powder in the bowels of one of the Potrero hills. The sensation is described as quite satisfactory; but the following communication to the last issue of our contemporary *Industry* of this city, shows that we have been quite outdone by the recent explosion of 80 quarts of nitro-glycerine in the bottom of an oil well near Cleveland, Ohio, 1218 feet below the surface.

The correspondent says that a result of the explosion has been the formation of a chamber at the bottom of the well about "as large as a kitchen," whatever that may be.

After the well was charged with the explosive, what is then called a "go-devil," a piece of iron the diameter of the well, and 18 inches in length, was carefully let down upon the glycerine, which was then exploded.

The correspondent describes the explosion as follows: It was distinctly heard and felt, and resembled what one would judge to be an immense explosion about four miles away. Considerable time elapsed after the explosion, enough for us to think that there would be no visible signs on the surface, and for some of the parties present to begin to get nearer the well on account of the lapses of time; but finally an immense volume of black foaming water and oil came from the mouth of the casing, gradually increasing in height and breadth until it reached about twenty feet, when it began to spread, and the center of the black column, as it were, began to rise higher and higher until it attained a height of at least 100 feet to 120 feet, emitting water, crude oil, lime rock, parts of the casisters which contained the glycerine, the "go-devil" in innumerable small pieces, the largest of which was not more than two inches and polished like a piece of silver. The effect of this shower of missiles was something very interesting and quite pretty, mingled with the different colors of oil and water. The firing of the well was a grand success, as we have a volume of gas ranging in pressure from ten to fifty pounds, according to the amount used for lighting the house, cooking, heating furnace, and so forth. The oil pumped from the well is quite strong and highly volatile. It emits considerable gas, giving every assurance of a continued supply.

FERRID, A NEW ARTIFICIAL STONE.—Mr. Herman Pools describes in the *Journal of the Association of Engineering Societies* a new artificial stone, which is a compound, partly chemical and partly mechanical, of iron, sulphur and silicon, with more or less foreign matter. It is mainly a supersaturated solution of iron in the sulphur with the silica acting as a binder and hardener. In normal color is a dark slate varying somewhat with the manner in which it is dressed, but the color can be somewhat modified by the introduction of pigments. Successful imitations of various colored brick and sandstones have been made. It is about the hardness of ordinary bluestone and can be worked by the usual stone-cutting tools, turned in a lathe or planed. The tensile strength is from 650 to 1200 pounds per square inch and under compression it endures from 9000 to 12,000 pounds. Its specific gravity is about 2.6. It melts at about 300° Fahr. very slowly. It does not deteriorate under exposure to the weather. As it can be melted and molded, it is applicable to a great variety of uses to which stone cannot be put, and particularly so for large castings, such as pipes for sewage, etc. Architectural forms can be very conveniently made from it in position if needed. For culverts and bridge foundations, the perfect smoothness, of which the surface is susceptible, is advantageous in lessening water friction.

STRIKES.—Those who believe strikes are of modern origin are likely to be disabused by a recent article in the *Pail Mail Gazette*. According to accounts, strikes were extensively indulged in in Egypt 3000 years ago. It appears that workmen in those times were paid at the beginning of the month, and their "blue Monday" lasted well into the month. Then they had a habit of striking to obtain the means of living. In the building of temples, King Pharaoh himself was sometimes appealed to, the workmen refusing to return to work until he had given his decision. These men appear to have been quite as obstinate as men of modern times, and generally made a "compromise," much as is done in these days. They appear to have had the habit of throwing down their tools on slight provocation, and assembling together to talk over their grievances. Sometimes efforts were made to prevent them leaving the buildings upon which they were at work, but these efforts do not appear to have been successful.

SMOKELESS POWDER.—At the conclusion of the recent military maneuvers at Bordeaux, France, Gen. Ferron, commander of the Eighteenth Army Corps, issued an order of the day in which he says that the use of the smokeless powder will make no change in defensive tactics, but will render offensive tactics more difficult. It is also proposed to use smoke balls to counteract the action of the smokeless powder.

ELECTRICITY.

Need of Electrical Education.

Since we have elected that electricity is to be our servant and shall be made to give us light and power, we ought to make some effort to gain an understanding of its nature. The prospective purchaser of an electric-lighting plant often asks the question, "Will I have to hire a man specially to take charge of my lighting machine?" Generally the answer will be, "Oh, no; your engineer can easily look after the dynamo in connection with his engine;" and so the engineer is liable to be called upon almost without notice to operate an electric-lighting machine, and while in most cases he will have no trouble, and will probably get along in some way (applying as best he can the rather meager information given him by the electrical expert who erects the plant), still the man who has some knowledge of the apparatus will get much better work out of it and give far better satisfaction both to his employer and himself. Further than this, he is likely to avoid many difficulties and dangers with the electrical plant, which another, not so well posted, will be very apt to fall into.

A mechanic has a piece of work to do in some factory where there is an electric-lighting or motor plant. He knows nothing about the subject of electricity, and should his work be around the conducting wires or any part of the apparatus itself, he fears to handle them, or if he be brave enough to go to the work, does it very gingerly, not knowing whether he is damaging anything or not, and running the risk of injury to himself at any moment. In most cases he will send for an electrician, but will often find to his chagrin that there was no danger, and that the work might have been done without harm either to the electrical plant or himself.

This being the situation, we think all will agree with the suggestion that every first-class mechanic and engineer should have some knowledge of electrical matters. He need not necessarily be an electrical engineer, but should have a sufficient understanding of the subject to save him from danger and utter helplessness should he ever be called upon to do work in connection with an electrical installation. Appreciating the importance of the subject, we shall endeavor from time to time to give, in this column, some simple items which we trust will be of interest and value to our readers.—*Western Machinist.*

ELECTRICAL FURNACES.—It seems not unlikely that electricity will be applied to smelting furnaces in the near future. An electrical furnace has been patented in England which is said to have given excellent results in the series of tests to which it has been subjected. The electrodes are blocks of carbon secured in metal cases, and placed opposite to each other in the walls of the furnace. The metal cases containing the carbons are kept cool by circulating water around them, and the carbons themselves are capable of automatic adjustment to compensate for wear. Provision is made in the furnace for the escape of gas and for the introduction of the charge, and the electromotive force of the current can be varied according to the varying resistance of the charge.

SPLICING ELECTRIC LIGHT CARBONS.—The electric-lighting company of Concord, N. H., is using a device by means of which, it is stated, a saving of 30 per cent is effected in the cost of arc-lamp carbons. The trimmers bring to the station all the short pieces of carbon collected on their daily rounds. These are sorted and matched together, to form a carbon about eight inches in length. These pieces are placed in a machine which forms a dowel on one piece and a socket in the other, and they are cemented at the joints. The cement with which they are joined is heat proof and is a good conductor, so that there is no change in light indicated when the joint is reached. The spliced carbons are used only in the lower holder. Carbons thus joined have been used by the company for over a year, and the process is considered entirely successful.

ELECTRICITY for operating surface railways has come to stay, if it can only be used properly, and this remains with the electric companies to settle. If there is no other way to compass the end sought than the use of the poles and overhead wire—a constant menace to life—then we ought to wait patiently till something better is devised. Such an arrangement is a mechanical monstrosity and seems to be born of the desire to do things cheaply.—*American Machinist.*

ELECTRICITY VS. GAS.—The Paris gas company is said to be the first of the important European works of the kind to really show a visible decline directly due to the increase in electric lighting. The decrease for August and September, as compared with the same months of 1889, is eight and six per cent respectively.

AMERICA is not only furnishing Europe with all its electric machines, and lighting Paris by electricity, but has recently sold \$300,000 worth of dynamos and lamps with which to light up the London station of the Midland railway of England.

It is estimated that electric lighting in Paris in 1891 and 1892 will require a motive-power equal to at least 32,000-horse power.

Passing Events.

Affairs in the Legislature relating to electric roads have changed in the past week. Influenced by public opinion, the members have experienced a change of feeling and the bills have been so amended as to permit overhead wires or any other system in any city in the State.

The ratification of the agreement between the mining companies on the Comstock and the Tunnel Company, by which royalties on ore are materially reduced, is a very important change for the better. It is stated that other expenses of the mines will also be reduced, and this, in connection with the resumption of deep mining, should bring this famous mining section to the front again and show some profit.

The hydraulic-mining interests are receiving more attention at the hands of the Legislature this year than for years past. Several measures favoring a resumption of work on these mines have been introduced. It is pretty certain that the Government will be asked to pass such laws as will permit the working of the auriferous ground in the hydraulic mines.

ALL the plants in the Connellsville coke region, Pa., have closed down and 16,000 coke workers and miners are out on strike.

The Mining Industry in California.

Mining has done a great deal for the State of California, but the State of California has done very little for mining. What little it has done for the industry has been begrudged. It established a State Geological Survey, ran it a few years, and stopped it before the results of the work were all published, or all the work was done. It established a State Mining Bureau, kept it along at a starvation rate some years, gave it one decent appropriation, and now talks of stopping it on account of the expense. Meantime there are several Bureaus devoted to the advancement of agriculture, viticulture, horticulture, appropriations for district agricultural fairs, etc., while the one institution devoted to the mining interests is threatened with extermination by misguided legislation seized with an economical fit.

The mining community of this State has no general or local organization, no unions, no fairs or traveling shows. It has never banded together for political preferment, and has never received political consideration. Its members work along at their prospects and mines, attending to their own business, paying their own way, and asking no aid from the State to call attention to its products. Its interests have been summarily taken in hand by the Legislatures, Federal and State courts, to the great loss of individuals and the general detriment of the industry.

The sole and single thing done by the State for the advantage of the mining industry has been the establishment and maintenance of the Mining Bureau and its museum, and it makes any one interested in California mines impatient, to say the least, when a project is sprung to abolish it, especially that it has now reached a position where it can be of great advantage and use.

If it could be shown that the State Mineralogist was incompetent or using his position for his own enrichment, or that the assistants were unfitted for their work, or that money was being squandered, or that the report was a useless compilation, the maps wrong, the mineral collections being lessened, there was no demand for the report, and that the whole Bureau was a useless piece of political machinery, then it might be proper to consider its abolition. But none of these things are asserted or charged; it seems to be the idea to abolish it on general principle, as a measure of economy.

If the Bureau had never done anything else than produce its last report, this would be sufficient answer to its detractors. This report is not only in demand from all parts of this State, but from all parts of the United States. Other mining States are about to establish similar institutions to the one we talk of giving up.

"Never in any other country," says John S. Hittell in the February Century, "did a province repay new masters more liberally for their trouble in its acquisition, nor any other conquered territory ever receive greater benefit from conquest. The most notable instances in history of triumphant invasions rewarded with large sums of precious metal were those of Babylon by Cyrus; Persia, Alexander; Mexico, Cortez; and Peru, Pizarro—all populous empires with wealth accumulated through centuries of prosperity. Yet not one of them yielded to its conquerors, within a generation, so much treasure as did desolate California to the Americans."

And it is still yielding this treasure. It is not gold alone which our soil yields—and we produce more of that than any country in the United States—but silver, copper, lead, iron, quicksilver, borax, chrome, manganese, petroleum, asphalt, salt, platinum, mica, asbestos, ocher, mineral paint, pumicestone, slate, sandstone, granite, marble, rock soap, gypsum, soapstone, sulphur, lignite, bituminous rock, kaolin, natural gas, mineral waters, cement, lithographic stone, tin, tellurium, soda and a dozen other mineral substances, all of economic value and all worked.

It is absurd to say that a mining industry, based on such a variety of products, and so profitable withal, should not have a State institution devoted exclusively to its interests. A museum of the products should continue to be maintained and an annual report of progress should be made.

If the miners had a class organization, as mechanics and agriculturists have, a vigorous protest would have been entered at the first

whisper about the abolition of the Bureau. But as stated, there is no society or organization maintained by the mining community. This Legislature is the first one in years where the representatives from the mining districts have been able to force their interests to consideration, and it seems strange, therefore, that it should be the one to bring up the question of the abolition of the Bureau.

If the institution is not properly and satisfactorily conducted, let it be investigated by all means, and the fault, if there be any, remedied. But we have heard no charges to this effect, and the Legislature will do itself no credit in discussing the abolition of the California State Mining Bureau.

Tunnel Royalty.

In the MINING AND SCIENTIFIC PRESS of Dec. 13, 1890, it was announced that the Comstock mining companies had arrived at an understanding with the Comstock Tunnel Co. regarding the royalty on all ore mined, the agreement to be ratified this month. This ratification has just taken place. The prices of the new royalties we published at the date above referred to. The royalty is to be four per cent upon the gold value on battery assays, provided the royalty does not exceed \$2 per ton; or, in other words, on all ores running \$50 per ton down, four per cent is to be paid, and all over \$50, the royalty is \$2 per ton.

The previous rate of royalty had been \$1 per ton on ores grading below \$40 per ton. When the average of the ore fell to \$14 and \$16 per ton, this rate combined to make the working of such a class of ores unprofitable. On ores averaging \$14 per ton, the royalty will now be only 56 cents per ton instead of \$1, and on \$10 ores the rate will be 40 cents, etc.

The mining companies have been this week signing the new contracts with the Tunnel Co., and partial payments have been made on the back royalties.

This is a very important step in reducing the mining expenses on the lode. If the companies will now turn their attention to pruning down some of their expenses of office management, aside from the actual mining departments, it will be another good step. Mining matters should then be looked into carefully, and the companies would begin to make some money.

As it is now, according to the assessor's report, in the case of most of the companies, the expression, "cost of production above yield," is altogether too frequent. The Virginia Enterprise has proven by statistics that for every dollar invested in the Comstock \$7 has been taken out, and in view of the coming deep mining there are still great possibilities in this wonderful lode. It cannot be said, however, that the public has any degree of overconfidence in the way mining affairs are conducted. It is pretty certain that when the prospecting again commences in the old lower levels so long abandoned, public attention will be turned in that direction a great deal more than is the case at present. If the management take advantage of the opportunity to correct certain alleged abuses, it would be better for the companies, the lode and the public. Reductions in expenses are promised, but they should not stop at tunnel royalty but be continued wherever possible.

RIVER IMPROVEMENT.—The report of the board appointed to make an examination of the Sacramento river has been received by the War Department. The recommendations of the board may be summarized as follows: First—The permanent yearly appropriation of not to exceed \$25,000 for the improvement and conservation of the channels and banks by use of a snag-boat and crew on Sacramento river above Sacramento. Second—A specific appropriation of \$275,000 for the closure of Jacob slough and the east bank of the Sacramento above the city of Sacramento. Third—A specific appropriation of \$300,000 for the treatment of the Yuba river near and above Marysville. Fourth—A specific annual appropriation of \$20,000 for the improvement of the navigable channel of Feather river.

CHAS. BUTTERS of the Butters ore-milling works, Kennett, Shasta Co., has gone to Delagoa bay, Africa, to erect an extensive chlorination plant for an English mining Co. Mr. Butters has been very successful in handling rebellious gold ores.

Hydraulic Mining.

The mining men in the House at Sacramento succeeded in getting all reference to mining debris cut out of Clark's proposed congressional memorial, praylog for \$1,000,000 to promote the navigability of the Sacramento river. As finally passed by the House, the evils which brought about the shoaling are charged to "the neglect by the National Government of its rivers and other causes." The words "mining debris" do not appear in the document.

Following is a copy of a joint resolution which has been introduced on the subject of hydraulic mining:

WHEREAS, There is on the western slope of the Sierra Nevada mountains, in the State of California, an area of land comprising thousands of square miles, which embraces rich deposits of gold-bearing gravel, many of which deposits have been remuneratively operated; and, whereas, the gold in a large portion of said deposits can only be obtained at a profit under the system known as hydraulic mining, which system has been perpetually enjoined by the State and Federal courts because of the alleged injury to navigation and to alluvial lands tributary to the watershed of said mining region by the deposit of debris; and, whereas, the State and nation have urgent need of an increase in the circulating medium, which, through the suppression of hydraulic mining in the region referred to in the foregoing, has been decreased to the extent of \$8,000,000 in gold annually, the counties affected in the meantime losing 50,000 in population and millions in assessed valuation; and, whereas, his Excellency, the Governor, in his inaugural address, suggests that the subject be thoroughly agitated, Congress memorialized and our Senators and Representatives urged to take all necessary steps to bring the matter properly before Congress at the earliest possible moment; therefore, he it

Resolved, That our Senators and Representatives in Congress be and they are hereby requested to exert themselves to the utmost to secure the enactment by Congress of such laws as will enable the profitable working of the auriferous gravel deposits of this State, and in such a manner that the property of others will not be injured nor the navigability of rivers impaired.

Resolved, That our Senators and Representatives be and they are hereby requested to secure appropriations from the National Treasury for the construction of works under the direction or instruction of a National Commission to accomplish the desired end, and whereby the debris now in the mountain streams tributary to the valley rivers of the State will be reclaimed and prevented from becoming a source of destruction to said rivers and a source of loss to owners of lands bordering thereon.

PATENT DECISION.—An interesting patent suit was decided in the Circuit Court Tuesday. The parties to the case were Edward Morton et al. vs. the California Automatic Can Company. The suit was instituted some time ago by the complainants to recover damages for an infringement on a patent. Judge Sawyer has ordered that a decree for the complainants should be entered declaring the validity of the claimants' patents and holding that they had been infringed. To the master in chancery was referred the final decision of the case as to the amount of damages and the profits made by the infringements.

THE California Academy of Sciences has petitioned the Superior Court for permission to mortgage its property on Market street near Fourth street to the Lick Trustees for \$100,000. The money is needed to complete the building now in course of erection on the lot. There is money still due to the society from the Lick fund, but until the amount is clearly established, the Lick Trustees decline to advance any, unless it is in the shape of a loan. The new building cost a great deal more than was originally expected.

KLAMATH RIVER.—The bill to repeal the Act declaring the Klamath river a navigable stream was passed in the Legislature this week. There are two or three miles of navigable water at the mouth which the cannery people use occasionally, and for this reason the miners above have been prevented from hydraulicking to any extent.

CALIFORNIA POWDER WORKS.—At the annual meeting of the stockholders of the California Powder Works the following named were elected Trustees: John Birmingham (President), J. G. Kittle, M. A. de Laveaga, B. H. Balrd and B. Peyton. John F. Lohse was re-elected Secretary and Treasurer.

JOSEPH HOGAN, of Butte, has been appointed State Mining Inspector of Montana.

Prospecting in Alaska.

Considerable prospecting is now being done all along the Alaskan Coast down to the British Columbia boundary. The Indians often report knowing of gold mines, but do not work them themselves, nor do they point them out to white men. The mountain ranges of the interior have been very little explored; there are no roads, few trails, no settlements, and scarcely anything, comparatively, is known of most of the region. Up at Douglas Island, Juneau, along the Yukon and thereabout, mining and prospecting are being carried on. Some of the men remain there in winter and others come to this city during the cold season, returning in the spring.

The mining possibilities of the Territory are very great. Its extended area is such there are immense unexplored and unprospected tracts. Rich placer and quartz mines are known and worked and there must be plenty of others to be found. The lack of facility of travel from point to point is, however, a great drawback. Nearly all transportation is by water. There are water-courses in all directions, but as soon as one leaves them, there are dense and pathless forests, swamps, bogs, etc., to contend with. Great tracts are covered with beds of moss over which it is difficult to pass. The mountain regions are devoid of settlements or good trails, so that altogether prospecting there is rather more difficult than in most places.

Notwithstanding the obstacles, however, there are numbers of prospectors and miners at work in the Territory. The possibility of finding placer ground is a great attraction for old miners, who realize the advantage of that class of mining over quartz. The placers so far found are pretty rich, but their distances from centers of population and the short season for mining are detrimental. It is no country for poor men to go to, as expenses are high and there is little opportunity of working for wages. Men with any means, however, with a desire for mining adventure, will find a good field in Alaska.

El Dorado Slate.

The slate quarries of El Dorado county shipped last year 1,013,960 pounds, an increase of 100 per cent over the previous year. This record of the slate companies is a promising one and shows that they are steadily advancing. The quarries now have orders for 15 carloads on hand. There are two quarries in active operation, the Chill Bar and the California, one on each side of the American river.

We had a conversation this week with Edward Bird, Superintendent of the California Slate Co., who says they have more orders than they can at present fill. The vein is a good one, but is not properly opened, owing to lack of capital. The quarry is opened in benches, and three galleries are running now. The company has an incline road and its own water-power. Most of the product is used for roofing purposes.

About \$10,000 worth of slate was sold last year, but this season more money will be raised and a larger force of men will be put at work. Two years ago it was difficult to find sale for the slate, but now the demand exceeds what the quarry can produce without the investment of more capital. The quarry is three miles from Placerville, and 14 men are at work in it. The slate is good tough material superior to that for similar purposes brought from the Eastern States.

A LEACHING PLANT.—The president of the Holmes Mining Co. of Nevada, in his annual report stated that the experimental test of the leaching works recently erected had been such an assured success that the leaching plant would soon be increased to a capacity for treating 100 tons of ore per day, which would enable low-grade ores to be profitably worked, and would permit of dividends being paid.

MONTANA COPPER.—Of the 122,950,000 pounds of copper produced in Montana during 1890, the Anaconda company is credited with 64,046,812; Parrot, 9,000,000; Clark's Colusa and the Boston and Montana, 26,822,804; Butte Reduction Works, 3,300,000; Colorado Smelting and Mining Company, 21,071,122; Butte and Boston, 5,357,723, and all other sources of copper supply in the State, 3,351,539 pounds.

Pavant Butte.

Pavant Butte, which stands 10 miles north from the Ice Springs lava-slide, and 17 miles by road from Fillmore, is an acute peak about 800 feet high. It is the tallest of all the volcanic hills in the Lake Bonneville region, and is a conspicuous landmark. In general form it is that of a cratered cone, but the crater is open at the south, and the circling crest has an acute culmination at the north. The engraving shows the general features of this curious volcanic cone.

Its material is a volcanic tuff; that is to say, it consists of light lapilli cemented into a coherent mass. Scattered through the mass are occasional boulders of basalt, which must have

Black Sand Mines.

Some of the black sand mining companies near Crescent City, Del Norte Co., are meeting with good prospects in their ocean beach mines. The sand for several miles up and down the coast from that place, yields both gold and platinum; very little if any capital has been put into this branch of mining, which if more properly developed would employ numbers of men.

The ocean beach sand mines near Lompoc on the southern coast are profitably worked by several companies. The beaches are worked during certain periods by small companies or by individuals. The same is the case at a few other points along the coast; but by far the most extensive deposits of auriferous black sand

PACIFIC WATER JACKET SMELTER

reached their position by ejection from the vent.

Geologists learn by constant and cumulative evidence that an eruption took place here while Lake Bonneville was at its highest stage, and beneath a body of water 350 feet deep. The resultant cone was built not only to the surface of the water, but 450 feet higher. Eruption ceased with the fall of the water and has not since been resumed.

The surface of the plain for a short distance in all directions from the cone is composed of debris from it. Beyond this southward outcrops the white marl, and beneath the white marl a field of lava.

APPRECIATIVE "G. H. B." of Tuscarora, Nevada, writes: "I very much appreciate your valuable paper, the MINING AND SCIENTIFIC PRESS. I consider that if I did not read more than the 'Health' column I would be fully rewarded for the subscription price."

THE January pay-rolls of the Comstock mines aggregated \$180,848.

are in Del Norte and Humboldt counties, on the ocean beaches. At Gold Bluff the deposits extend back several miles. In the early days the deposits paid handsomely. There are difficulties, however, in working the deposits back from the beach. Capital is needed to outfit the claims, and there is very little capital invested in mines in that region. The largest known deposit has not been worked in some years. There is room for improvement in the methods of working the black sands of the ocean beaches, as under present conditions there is considerable loss of gold.

THREE miners were rescued from the Susquehanna coal mine, Pa., after being imprisoned in the flooded mine for five days. They were aroused in a little hole on the top of a cross-heading, with the water nearly touching their feet.

THERE are seven ships carrying 9000 tons of niter from Chill on the way to this port. The local powder companies will not sell any except at a large advance.

A Smelting Plant.

(Continued from page 97.)

A boiler-iron foundation and curb is provided, inside of which the hulk crucible is made, which prevents any loss should the crucible crack or have a tendency to leak. The lead well, connecting by syphon-tap, is located outside of curb, and is also inclosed. Two slag-spouts are provided for the discharge of slag (one at each end of the furnace), which can be easily detached and replaced when burned out.

The superstructure of brickwork is supported by four heavy iron columns, carrying a deck plate made of wrought-iron channel beams well secured with bolts and wrought-iron plates. The brickwork is securely bonded by wrought-iron bolts and heavy cast-iron corner plates, thus preventing a tendency to crack. The top of the brickwork is capped by a heavy cast-iron plate, to which is fastened the feed-hopper. The dust and fumes pass into the main condensing-chamber through the square pipe at the rear of furnace, as shown in cut.

A galvanized wind or "hustle" pipe surrounds the furnace and receives the blast from the blower and distributes it through the tuyere pipes.

A telescope stack with hood is suspended from proper supports above the furnace, which can be raised or lowered as occasion requires, and is for the purpose of taking off obnoxious fumes should they find their way through the charge into the feed-hopper. The furnace is furnished complete with all pipes and fittings necessary to supply and discharge the water for cooling the jackets.

The Keystone Boiler Works.

The Keystone Boiler Works (Hamilton & Leach), on the corner of Folsom and Main streets, in this city, filled contracts last year for all parts of the coast. Among others, four lumber companies have been supplied with 15 boilers as follows: Nine, each 54 inches in diameter and 16 feet long, built of steel, with uptakes, steel tubes, grates and bars complete for the Bellingham Bay Company. The Sierra Lumber Co. was furnished with two steel boilers, each 48 inches in diameter and 16 feet long. The Towle Brothers' Lumber Co. has also received two boilers, each 42 inches in diameter and 13 feet long. Two boilers were supplied to a lumber company in Amador county, each boiler being 42 inches in diameter and 14 feet long, and two more to the Tulare Gas Co. In this city the stock of 15 boilers set up in the works of the California Electric Light Company, two boilers for the Baldwin Electric Light Works, and the five boilers in the Chronicle building, can be seen in daily use, and the different engineers in charge all recommend the work highly.

Among stationary boilers built during the year by the works in this city are: One 64 inches in diameter and 16 feet long in the Keyes building on Stockton and O'Farrell streets; one 54 inches diameter and 16 feet long for the Golden Gate distillery; one for the Electric Improvement Co., on the corner of Davis and Vallejo streets, 72 inches in diameter and 16 feet long, and one for the Union Club, 48 inches diameter and 14 feet long. They have recently finished a marine boiler for the whaler Belvidere, and others of a similar type were made last year. These works have been very successful, as the above record shows. Wrought iron tanks of all kinds, salmon-canery plant and every kind of stationary wrought-iron work is undertaken, and nothing leaves the works till it has been tested and shown to be all that the specifications require.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

JOSEPH WINTERBURN CO., Feb. 5. Object, to conduct a general printing and electrotyping business. Capital stock, \$35,000. Directors—Joseph Winterburn, Geo. F. Winterburn, Wm. Hoffschneider, Wm. Hoffschneider Jr. and Theodore Trautner.

ARCADIA HOTEL CO., Feb. 5. Object, to conduct a hotel in Santa Monica, Los Angeles Co. Capital stock, \$100,000. Directors—H. I. Kowalski, E. Lastreto, S. Ephraime, W. M. Fitzmaurice and C. Levy.

FAIRBANKS SUPPLY CO., Feb. 6. Object, to deal in warehouse and railway supplies. Capital stock, \$50,000. Directors—H. L. Hutchinson, L. H. Parker, Wm. Rennie and W. C. Allis.

EAGLESON-HAWKINS CO., Feb. 6. Object, to deal in furnishing goods. Capital stock, \$200,000. Directors—R. Eagleson, J. G. Eagleson, W. I. Hawkins, W. E. Hawkins, F. H. McConnell, J. McCulloch and E. B. Holden.

NEW YORK M. AND PROSPECTING CO., Feb. 9. Capital stock, \$100,000. Directors—E. H. Cooke, B. E. Stall, J. P. O'Brien, C. H. Wall and R. G. Falk.

ST. PAUL M. AND PROSPECTING CO., Feb. 9. Capital stock, \$100,000. Directors—E. H. Cooke, B. E. Stall, J. P. O'Brien, C. H. Wall and R. G. Falk.

A NEW AMERICAN BOOK

Minerals, Mines, and Mining

A PRACTICAL MANUAL OF MINERALS, MINES, AND MINING; comprising suggestions as to the localities and associations of all the useful Minerals, full description of the most effective methods for both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D., author of "The Metallurgy of Iron and Steel." Illustrated by 171 engravings. In one volume, 8vo, 387 pages. Price \$4.50, by mail, free of postage, to any address in the world.

CONTENTS.—PART I. MINING, MINERALOGY, AND ECONOMIC TREATMENT AND HISTORY OF THE USEFUL MINERALS. Mining, Mineralogy, Preliminary Principles and Preparations, Economic Treatment and History of the Useful Minerals, Gold, Silver, Copper, Nickel, Iron, Tin, Zinc, Lead, Manganese, Platinum, Iridium, Mercury, Antimony, Bismuth, Chromium, Cobalt, Cerium, and Emery, Pumice Stone, Infusorial Earth, Grindstones, Buhstones, the Diamond.

PART II. MINING WORK AND ARCHITECTURE, INCLUDING VARIOUS SOCIETIES, WITH DESCRIPTION OF ASSOCIATED APPARATUS AND MACHINERY. Mining Construction and Machinery. [This part comprises 90 pages, illustrated by 165 engravings, with details too full to be comprised within the limits of this advertisement.]

APPENDIX. Sinking Artesian Wells, Oil and Gas Wells. Index.

An illustrated Circular, 4 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 87 pages, 8vo, and our other catalogues and circulars, the whole covering all of the branches of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO., INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS, 810 Walnut St., Philadelphia, Pa., U. S. A.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works, 21 & 223 First St., San Francisco, Cal. JOHN W. QUICK, Proprietor.

Manufacturers of

SPAULDING'S

Inserted Tooth

AND

CHISEL BIT

CIRCULAR

Saws.

SAW MILLS AND MACHINERY Of all kinds made to order. Send for Descriptive Catalogue 17 and 19 Fremont St., San Francisco

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American finished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

WM. H. CONLY,

Lands, Mining and Commission,

124 SANSOME STREET,

Rooms 21 and 22,

Telephone No. 5057.

SAN FRANCISCO.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Ropes, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap, do us the favor of its again.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/4 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shapes Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths. STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St.,

San Francisco.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Re-torts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

TUSTIN'S PULVERIZER.

Tustin's Pulverizer WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

DEANE STEAM PUMP.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE, Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO OAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Iron and Machine Works.

Between Mission and Howard, SAN FRANCISCO.

GAS WORK A SPECIALTY.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and min'g office on the Northwest Coast, with a collection of about 400 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, OREOK. SAMPLES OF ORE, FUELS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. WILLIAM E. EVERETTE, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

A. S. GRANT.

S. B. CONNOR

CONNOR & GRANT, Millwrights and Engineers

303 CALIFORNIA STREET, Rooms 30 and 31, SAN FRANCISCO, CAL.

Designers and Constructors of Gold and Silver Mills Hoisting and Pumping Works, Tramways, and everything pertaining to the Mining and Reduction of Ores.

Bewick, Moreing & Hooper, MINING ENGINEERS,

508 California Street, San Francisco, Ca

Suffolk House, Laurence, Pointview Hill,

Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Feb. 12, 1891.
The weather continues the absorbing topic, and will be throughout the present month. With a generous, well-distributed rainfall, business in all lines will revive. The deposit of snow on the mountain ranges is very light, and unless large deposits are made in this month and March, the supply of water for mining purposes will be light in many localities; but then river mining can be done to much better advantage.

MEXICAN DOLLARS—The market is barely steady at 82 to 83 cts.

SILVER—Department purchases in this month are reported as follows:

Date.	Offered ounces.	Purchased ounces.	Price paid per ounce.
Feb. 4.....	1,132,000	478,000	\$1.0260 to \$1.0275
Feb. 6.....	1,057,000	507,000	1.0350 to 1.0225
Feb. 9.....	788,000	150,000	1.0605 to 1.0100
Feb. 11.....	823,000	414,000	1.0150 to 1.0190

Total purchase to date, 1,549,000.

Pending the action of Congress on the Free-Coinage bill, the markets at home and abroad are heavy. The monetarists at the East are leaving nothing undone to defeat silver legislation. While it cannot be denied that some of the gold bugs are honest in their views, yet it is equally self-evident that many of them are actuated by self-interest in their desire to defeat bimetalism. With silver a commodity, speculation in farm products, and also in all securities having silver for their basis of value, becomes more profitable to the moneyed few. On this coast, where the farming and mining industries are largely dependent upon the price of silver, there is no leading commercial paper to advocate bimetalism, which naturally creates the belief at the East that we are indifferent to the remonetizing of silver. It is hard to predict the legislation by this Congress, but it is quite certain that the next Congress will pass a free-coinage bill, and if it is vetoed it will be passed over the President's veto. There is little silver offered for sale in our market—that is, not much compared with former years. The output of the mines appears to be less.

QUICKSILVER—Receipts the past week aggregate 282 flasks, and exports by sea 10 flasks. The market is lower, due to the unfavorable effect of the McKinley tariff, and also to more selling competition. Outside mines sell at the best obtainable figures, even if a cent below asking prices for standard brands.

BORAX—Exports by sea the past week aggregate 811,523 lbs. of borates to New York. The market is reported steady, with an improving inquiry from the East.

COPPER—Exports by sea the past week aggregate as follows: To New York, 1600 lbs. copper cement, and 870,200 lbs. copper matte. Compared with the first two months in 1890, the output of the mines on this coast this year shows an increase. The home consumption is larger. The Eastern and European markets are reported by telegraph as having a steadier, firmer tone, with better prices looked for later on.

LEAD—The smelter at Tacoma, Washington, is turning out about 750 pigs every five days, which, being marketed in this city, has created lower prices. Cannery and other large consumers are confining their purchases in order to buy as cheap as possible.

TIN—The market shows more strength. Cannery are taking more. English advices report a barely steady market for Straits, but a continued free shipment of pig to America. The consumption on this coast promises to be large this year.

IRON—The market is barely steady for spot. With rain a better demand would set in. The supply here and to arrive is large. To sell, concessions are necessary.

LIME—Receipts the past week aggregate 3482 bbls., and exports by sea 100 bbls. to Kahului and 300 bbls. to Honolulu. The market is steady at current quotations.

COAL—Imports the past week aggregate as follows: Departure Bay, 4020 tons; Esquimalt, 1840; Tacoma, 6000; Newcastle, N. S. W., 10660; Coos Bay, 350; Seattle, 10,348; Nanaimo, 873; Comox, 4100. Total, 28,647 tons. The market shows continued weakness, with concessions obtainable, although no lower quotations are made public. Australian from ships' sides is obtainable—below \$9 a ton. With southerly winds, Australian vessels will soon come in, as will also the English vessels about due. These arrivals would break the market. Coast colliers' outputs continue large, and with more foreign to draw from, prices must give way. Dealers buy sparingly. A noteworthy event of 1890 was the quiet opening of a bituminous coal mine in this State near Carmelo Bay in Monterey county. The deposit is said to average about five feet wide. The grade is good, comparing favorably with Wellington. For steam purposes it is well adapted. It is the only bituminous coal mine, outside of British Columbia, on this coast.

Eastern Metal Markets.

By Telegraph.

New York, February 12.—The following are the closing prices the past week:

	Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday.....	48 1/2	1 02 1/2	14 25	4 40	20 00
Friday.....	48 1/2	1 01 1/2	14 25	4 40	20 00
Saturday.....	48 1/2	1 00 1/2	14 25	4 35	20 10
Sunday.....	48 1/2	1 01 1/2	14 25	4 35	20 10
Tuesday.....	48 1/2	1 01 1/2	14 25	4 32 1/2	20 05
Wednesday.....	48 1/2	1 01 1/2	14 25	4 34 1/2	20 10

Copper is steady, with outside holders cleaning up. Tin is strong; Straits, \$20.10. Cannery may be interested to know the edge is off the tiplaine boom for the moment. Cash buyers may pick up a small line of spot stock here and there at a little concession from the prices asked for the future. Quicksilver is moderate at 67¢@68¢. Borax at last prices is firm. The recent supplies have been well absorbed.

The total hullion output of the Comstock lode during the year 1890, according to statements filed with the assessor of Storey county, Nev., aggregated \$3,915,212, as compared with a production of \$5,145,681 in 1889.

Mining Share Market.

Mining shares the past week were depressed by the manipulators, who withdrew active bidding in order to take in all the stocks they could at lower prices. Heretofore the market has acted as if the moves were made to sell stock, but the recent decline puts a different front on the situation, for as soon as outsiders began to be attracted by the strength of the market, bear reports were set afloat. No encouraging news was allowed to be put out by the inside bureau of special information, but on the contrary, discouraging news was circulated by the bureau. To still further depress stocks, the quarterly reports of the ore-producing mines were made public one month earlier than usual. This was doubtless done owing to the supposed sworn statements being unusually bad. It looks if those who buy stocks for cash and will not be frightened if a small decline should take place, will make money on the investment before thirty days pass by, provided they are content with a fair profit. This opinion is based on work of a very important character being done in several of the mines, which cannot be kept secret much longer.

In outside stocks the Tuscaroras showed a strong tone at a slight decline, as if insiders were buying. The Quijotas appear to be blackboarded. The Bodies made quite an upward move under the leadership of Bodie, which doubled up, but then fell back much easier. There are plenty of hull points out on the stock. Eureka holds very strong with the stock apparently scarce.

The market opened this (Thursday) morning fairly steady, with light trading. After the regular session the middle stocks, under Hale and Norcross leadership, scored a slight advance; the other stocks had a firm tone, particularly the Union and Sierra Nevada group. For the Alta group there has been and continues to be strong buying. The Bodies were higher after the board this morning.

Private but thoroughly reliable news from the Comstock mines is of a very important character, but inside news is still of a bearish character. Official letters received to-day from the Gold Hill mines are remarkable for the absence of any favorable news, which is entirely different from reliable private advices. The official letter from Savage reports active work under way, but fails to report about the ore found on the levels they are now working on. The official letter from Hale and Norcross reports being in ore on all the various levels, but this we outlined two weeks ago. Running west, they ought soon to report being in very rich ore, unless the mine managers suppress the news so as to keep control of the mine at the annual election in next month. If the brokers refuse to give proxies for stocks in their name, then those who buy in control will be forced to enter the market as buyers of the stock so as to retain possession of the mine. In Union and Sierra Nevada several levels are ready for active prospecting work. From Com. Virginia, Ophir and Gould and Curry, favorable news comes to hand. Everything points to more active and exciting times in the near future. From the outside mines our advices report very rich ore on the 350-foot level in Belle Isle. The ledge is about three feet wide. They have followed it for a distance of about 300 feet. They are still running to tap the downward continuation on the 450-foot level. From the other Tuscarora mines, the news is uniformly good. From the Bodies, our advices are confirmatory of those published last week. All indications point to close proximity to a rich find in Bodie. Bulwer is extracting ore for milling.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

A COMMON SENSE CALENDAR.

The calendars that come in the fall are as numerous as the flowers that bloom in the spring. Many further resemble the flowers in that they come without being sent for, and fade after a very brief existence. The most sensible and business-like Calendar that we have seen comes to us from M. W. Ayer & Son, Newspaper Advertising Agents, Philadelphia, and bears their "Keeplog everlasting at it" imprint. It is so large and clear that its dates can be easily distinguished across an office, and is printed in a manner to reconcile the most fastidious to its company for a year. It is sent to any address, postpaid, on receipt of 25 cents.

For Sale for Want of Use.

One horizontal reversible engine, 8x12; one hoisting drum, 30x30, with V friction and eccentric; one gear, 4 feet x 4 inches face; one jack 4-inch head pump; one steel boiler, 36 inches x 12 feet; stack with fronts, wood grate bars; safety rods, pump and heater, etc.; being hoisting works complete. Has been little used. The same can be seen at Glenoco, Calaveras Co., Cal. For further particulars, apply to J. H. Gillispy, 1914 Stockton St., San Francisco.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of February, 1891, an assessment, No. 22, of Three (3) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 353 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 9th day of March, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of March, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. W. BARROWS, Secretary pro tem. Office, Room 11, No. 353 California Street, San Francisco, California.

All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies a SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap onto the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$1.50 each.
N. W. MOODEY, Fresno, Cal.

WINANS' ANTI-INCORUSTATION POWDER,

For Removing and Preventing Scale, Corrosion and Pitting in Steam Boilers.

RIFE'S HYDRAULIC ENGINE (or Ram)

PATENTED FEB. 8, 1887.

For Supplying Water to Small Towns, Factories, Steam Mills, Dairies, Stock Yards, Residences, etc., and for Irrigation, Railroad Tanks, Etc.

Constructed upon a new and improved principle greatly increasing the capacity and avoiding extreme concussion that has heretofore proved destructive to all common Hydraulic Rams, making this ESPECIALLY adapted to Railroad water supply and irrigation.

FOR INFORMATION ON IRRIGATION, ADDRESS

The Yosemite National Park.

[Written for the Press.]

The accompanying map will indicate to some extent the area and resources of the recently created Yosemite National Park. It will be seen to embrace nearly 42 townships, making about 1500 square miles, or 960,000 acres—less 36,111 acres comprised in the Yosemite grant, which, with all bona fide entries, are exempt from the provisions of the Act. The principal purpose in reserving this magnificent domain was to protect the Yosemite Valley itself and its great water-shed from spoliation, and conserve, while increasing, the manifold attractions of that marvelous locality.

It is to the State Geological Survey, under Prof. J. D. Whitney, that we are indebted for the first outlining of the scenic wonders of this

wildly picturesque region. Until then, and long subsequent thereto, it was only indifferently known to the occasional hunter and irrepressible prospector; but, as time rolled on, the abundance and variety of its succulent grasses attracted the sheep-herder and his myriad flocks, who, in ungrateful return for the free pasturage thus accorded him, not only turned those beautiful mountain gardens into dusty deserts, but devastated immense areas of its primeval forests with devouring fire. On the very last occasion that I pulled myself up, by the Anderson rope, to the summit of the "Half Dome" from that central and lofty standpoint, I counted no less than nineteen forest-consuming fires burning in nearly every direction. But now, thank God, the California delegation, and Congress—yes, and the President of the United States for approving the

Act, the hands of the despoiler and vandal are from henceforth to be legally paralyzed.

It may be pertinent in this connection to say that not only do the forests and lofty peaks of the Sierras attract moisture, but Nature utilizes the rain and snow-distilling clouds throughout these vast solitudes, by building there her great reservoirs of snow, with which to supply the thirsty earth with life-giving madefaction during our dry and lengthy summers, and to make the springs and streams that run among the hills jubilant with unceasing songs of gladness, throughout the year; and the mighty forests, throwing their protecting arms of shadow over and around them, guard the precious treasures from untimely liquefaction.

This beneficent and timely provision alone should be sufficient to merit the eternal gratitude, not only of our own people, but of the

lovers of the beautiful and the admirers of the sublime and marvelous in every civilized land, that Congress has created the Yosemite National Park and the Sequoian National Parks.

But when it is remembered, in connection with the noble Sequoias, that in Miocene times and the Tertiary period there were, according to Prof. J. G. Lemmon, the gifted and industrious hotanist of the State Board of Forestry, over 20 different species of this remarkable genus, as proven by fossil data from various parts of the world, yet now there are only two living species left, the big tree and the redwood, and those found only in California, is not this fact of itself a sufficient justification for reserving and preserving all of the Sequoias

*See Third Biennial Report of the California State Board of Forestry for 1889-1890, pages 167, 158.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—Eds.

Mines Around Angels.

[From Our Own Correspondent.]

EDITORS PRESS:—The mines of the camp are on the mother lode, its forks and mineralized bodies near to the lode. The Madison, Gold Cliff, Stickle, Bennett, Lindsey and Pioneer follow in succession on the main mother lode; the Suffolk G. M. Co.'s veins, parallel to the north; then the Excelsior and El Dorado fill in and are paralleled in turn by the Fletcher and Crystal. Following these on the east come the Stickle, Utica and Lightner, while to the north of all these mines lies the Angels Quartz M. Co. property. It will be seen that the section has four parallel deposits or veins, each about 600 feet distant from each other and all in or adjoining the town of Angels.

The Madelon.

This mine is now owned by A. J. & T. M. Lane. They have run a drift from the surface 400 feet on the center vein, stopping out from 20 to 27 feet in width. As the three veins are all within 100 feet of space, and the entire width is mineralized, it might be called a vein of 100 feet in width, the vein-matter in quartz and talc slate averaging, from the 400-foot drift, \$2.50 a ton, though some months have shown an average of \$2.80. In addition to the free gold, the ore carries an average of 20 per cent of sulphurets that average in value \$55 a ton. The mine has a complete ten-stamp mill with water-power; the daily capacity of the mill is 30 tons. This mine has paid its way from the start, and when equipped with 40 to 80 stamps will come to the front as a halion-producer; as it is, the property is a very nice thing to own. Adjoining is

The Gold Cliff.

This mine is being worked under bond and lease by Messrs. C. D. Lane, W. E. Shephard and Woodson Garrard, with Mr. Woodson Garrard as superintendent. Previous to the present owner's possession, various methods by different parties had been tried on the ore; one after another was discarded, and finally the old-fashioned stamps were set to dropping, but they failed to make the mine profitable. Then, when others had failed, the present lessees took hold and Mr. Woodson Garrard soon had it a paying property and has steadily added to the net profits. The vein is now 60 feet in width of talc slate and quartz of an average value of \$1.50 a ton. The ore carries two per cent of sulphurets assaying \$55 to the ton. The mill is of 20 stamps with water for power, and crushes 60 tons of ore a day at an average cost for mining and milling of 65 cents a ton. Mr. Garrard has every reason to be proud of his success, and the other lessees to congratulate themselves on their good fortune. The Stickle & Bennett, Lindsey, Excelsior, El Dorado & Pioneer are each awaiting capital to take hold and turn their hidden values into golden twenties.

The Suffolk G. M. Co.

Mr. C. D. Smythe is superintendent and joint owner of the mine. The ore of this property differs from those of the other mines in this section. Tellurium, copper pyrites and various combinations are encountered, which promise to make this in time a valuable property. At present, pending the settlement of an estate, the property is idle.

The Angels Quartz M. Co.

J. V. Coleman, owner—G. H. Fox, superintendent. This property contains within its side lines the extensions of all the mines in the camp, save the Pioneer and Suffolk. Almost the entire width has been crosscut at various depths, and ore encountered that has convinced the superintendent that if sufficient stamps were furnished, the entire width of the property could be worked to a profit. The mine is closed for the present, awaiting the erection of a large mill the coming spring.

The Utica.

This property dates back to the early days of quartz-mining. The surface ore was worked from time to time by arrastra process at irregular intervals, Senator Fair working the mine out (?) Finally the property came into the hands of Mr. C. D. Lane and some miners associated with him. Under Mr. Lane, the old mine began to grow, until satisfied that they had sufficient in sight to attract capital, when the attention of Messrs. Hayward & Hohart was called to the mine. Mr. Hayward inspected the property in person, and after sinking 550 feet, brought two-thirds of the mine, Mr. C. D. Lane retaining his one-third and being continued in charge as superintendent. From the time of purchase until the present there has been a continuous effort made to put the property on the best possible basis. First two shafts, each of 550 feet in depth, were put down and the vein crosscut and developed; then the mill was increased to 60 stamps, and two miles of pipe put in to connect with the mine's private ditch. A sawmill for framing timbers was added and a large air-compressor, sufficient to drive 12 drills, put in. It seemed as though the limit had been reached, but the owners continued and added the Stickle mine with its 20-stamp mill to the Utica, and put that shaft down 600 feet. Then to com-

plete the plant, the Union Water Co.'s entire system of reservoirs and ditches was added. In addition, the Angels Chlorination Works were purchased and their capacity doubled. With this was added the mansion for the superintendent's offices, shops, stables and every detail requisite in the working of a large mine on a successful basis. The company is not given to publishing bulletins of its business, and in consequence it is not an easy matter to make a correct estimate of cost of plant, value of ore, and profit enjoyed. It may, however, be safely estimated that the plant represents an investment of nearly half a million dollars. The vein is from 17 to 35 feet in width, of an average value of \$4 a ton, which ore is mined and milled at a cost not to exceed \$2.25 a ton; that the 60-stamp mill—which is a model in every way—crushes 3 tons to the stamp every 24 hours, giving a net profit on 180 tons at \$1.75 a ton, of \$305 a day from the Utica mill alone. Once the Stickle is fully equipped, it can be counted on to do equally as well, or swell the proceeds to \$610 a day from the mine alone, independent of the revenue derived from the sale of water to all of the other mines and for irrigation. The chlorination works contributes its proportion in addition. I have thus tried to show, not how much the owners are making from their investment, but what can be made in working a \$4 vein on business principles, with the necessary capital and competent management. The affable superintendent, Mr. C. D. Lane, is the same "Charley Lane" that he has always been, and it will take more than a Utica to make him otherwise. In his work he has been ably assisted by the practical men that he has called to his aid. Under Mr. Joo. Reaver, the mill moves with the regularity of a clock pendulum. Next to the high degree of perfection that has been attained in the automatic plan of the mill, the most noticeable feature is the absence of unnecessary men. I have at no time seen more than three men in the entire mill. The vim and push that characterized the miners and everything connected with the mine, together with the evidence of a close attention to details, is traceable directly to the mine foreman, Mr. C. A. Lillie. Not only his eye but his person is everywhere at one time; quick, energetic, watchful and competent, he has proven himself the right man in the right place. While he may be equaled, I have met no mine foreman that could excel him.

Over the home of the superintendent, his estimable wife presides, extending a kindly hospitality to all who are so favored as to be her guests. Of a well-known mining family (the Garrards), she enjoys the enviable distinction of being called "as good a miner as her husband." In consequence, she "dips" into the "faulter" in mining without a "break," "shoot"ing off many a witty "shaft" as she "picks" her way along the "track" and "sets" her opinion before the listener with the "selvage" that "caps" the "apex" of the "vein" and "lodes" the hearer with a fund of information that is only equaled when with "ca(l)m"-ness she "drops" into the mill and "amalgamate" her remarks, "tapp(t)ing the floor with her "shoe," that you may the more "quok"-ly "die"-gest the "concentrated" remarks that are so dealt out to you by one who is an exceptional helpmate and most charming hostess.

Utica Chlorination Works.

These works are the property of the Utica mine, and are in charge of Mr. T. N. Smith, under whose management they have been reconstructed, their capacity doubled and the plant made as complete, and as good results obtained as in any chlorination works on the coast. With the two furnaces the capacity of the works will be 6 tons of concentrated sulphurets a day; \$20 a ton is charged for treatment and about 10 per cent deducted for loss.

The Union Water Co.'s Ditch

Is now the property of Messrs. Hayward & Hohart. This water system is one of, if not the oldest, in the county. The source of supply is the Bear river and the north fork of the Stanislaus river; added to this are reservoirs that catch the water from the melting snows and hold them until they are carried over the mountains to the mines and gardens 30 miles below. The mines consume about all of the present water supply in dry seasons. It is the intention of the owners to increase the storage capacity, enlarge the ditch and make the property second to none. The ditch has before it a great future not alone in the supply of water to the various mines, but to it and from it must come the future prosperity of all the foothill section from Murphy's to Copperopolis.

In this belt are thousands of acres on which the orange, fig, olive, peach, apple, pear and vine can be grown to the greatest degree of perfection and profit, on lands that can now be bought for an equal number in dollars that similar land in every particular now commands an equal number of hundreds of dollars in other localities. In this one branch the State today owes her greatest measure of prosperity from the fact that these old mining ditches have caused the foothills to become golden in their wealth of fruits, watered by the ditches of the ennobled and suppressed hydraulic mining industry.

Altaville Foundry and Machine Shops.

No small degree of the profits attending mining in the Angels mines is due to the fact that at Altaville, which may be said to be an extension of Angels, Mr. D. D. Demorest has erected and equipped a complete foundry and machine shop, furnishing a large part of the

castings required in the operation of the mines and mills, and making all the necessary repairing. That this convenience is appreciated is evidenced by the large amount of work that is constantly turned out from the shops.

Angels has the miner, water, climate and every requisite to successful mining. In time capital will take hold of the numerous ledges now idle, but known to be equally as good as those being worked, and then Angels will come to the front and take the position she is destined to fill as "the best mining town on the coast."

Murphys, Cal.

E. H. SCHAEFFLE.

What Is an Anti-Cyclone?

Lieutenant Finley has issued a bulletin explaining the use of the term "anti-cyclone" in meteorology. A former bulletin dealt with the cyclone. The later bulletin reads:

The employment of the term anti-cyclone for meteorological purposes naturally follows the use of the word cyclone. The prefix anti indicates the existence of a circulatory system in the air directly contrary to that which prevails in the cyclone. As the circulation of the air currents differ widely from those of the cyclone, so also are the accessory phenomena of an opposite nature. The anti-cyclone is an area of high barometer in which the atmospheric pressure is decidedly above the normal. The highest pressure is at the center and diminishes thence outward to the circumference. The circulation of the air is spirally outward from the center. The air does not attain a circular motion anywhere within the area, and the tendency to a spiral movement is only disclosed when the whole disturbance is charted and observations from every quarter are available. The circulation of the air in an anti-cyclone gives rise to westerly winds on the north side of the center, northerly winds on the east side, easterly winds on the south side, and southerly winds on the west side. The four quadrants of an anti-cyclone are distinguished as follows: In the N. E. quadrant, clear, cold, dry weather, with winds of moderate force; in the S. E. quadrant, a cold wave, with the lowest temperatures, clear, dry air and high winds; in the S. W. quadrant, fair, cool, pleasant weather, with gentle winds and haze; in the N. W. quadrant, increasing temperature, increasing humidity, cloud formation and threatening weather.

The front of an anti-cyclone is the extreme rear of a cyclone, and the extreme rear of an anti-cyclone is the front of a cyclone. The air moves downward and outward in an anti-cyclone and inward and upward in a cyclone. The air which flows outward from the top of a cyclone is cold and dry because deprived of its heat and moisture in the development of rain or snow. This air descends toward the earth's surface and gives rise to the formation of the anti-cyclone. There is always an anti-cyclone between two cyclones, both of which are feeding the former and maintaining its identity. The cold weather of an anti-cyclone is partly due to the descent of cold air from above, the horizontal flow of cold air from the northern regions and the effect of radiation, which is greatly augmented by the absence of vapor and clouds. The area of the anti-cyclone is frequently greater than that of the cyclone and its form less regular. Anti-cyclone is synonymous with clear, cool weather, moderate winds and a cold wave; and cyclones with cloudy weather, rain or snow, high winds and warm wave. The word "high" on the weather map indicates the area of an anti-cyclone, and the word "low" the area of a cyclone. Both disturbances are beneficial and necessary to the prosperity of mankind.

THE EMMA MINE is getting in fine shape, and now has lots of ore in sight. A few days ago workmen uncovered another body of very fine ore at a point 200 feet below the surface. In the southeastern portion of the mine, and which is believed to be a continuation of the ore struck last summer. The rich ore is two feet wide, while there is a large amount of good, concentrating ore. The first class is being taken out ready to send down to the smelters, while the second class is being piled up ready for concentrating in the spring. Sup't Wallace says the mine looks better than it has for a number of years; in fact, is looking fine, and that they will be able to ship a great deal of ore. Just here comes an important question. The old tramway is so worn out that it will require new ties, new rails, and, in fact, almost rebuilding entirely to make it answer the purpose of bringing down ore and taking up supplies. Last month the Emma Co. sent down 30 tons of ore by teams at considerable cost of fixing the wagon-road, but now it is proposed to ask aid from the county in rebuilding the wagon-road so it can be used at all seasons.—Salt Lake Tribune.

THE NICARAGUA CANAL.—Ex-Senator Warner Miller of New York, President of the Nicaragua Canal Construction Co., has accepted by telegraph the invitation lately extended to him to visit San Francisco to address our citizens on the Inter-oceanic canal. The following organizations joined in extending him the invitation: The Chamber of Commerce of San Francisco, the Board of Trade of San Francisco, the California Academy of Sciences, the Geographical Society of the Pacific, the Mechanics' Institute of San Francisco, the Produce Exchange of San Francisco.

Gold Placers in Nevada.

The Placer Mines of White Pine County.

We are in receipt of the report of the Surveyor-General and State Land Register of Nevada for the years 1889-90, with the accomplishments of J. E. Jones, State Land Register. It is a valuable book of 200 pages. Concerning the placer mines of White Pine county, we extract the following from the report:

In White Pine county the Osceola Gravel Mining Company owns very extensive and valuable properties. This company has been operating at Osceola for several years. It has expended a large sum of money in bringing water a distance of 18½ miles to its mines, and from information at hand the mines are yielding a fair profit on the capital invested. The output of this company's mines for the years 1889 and 1890 was \$40,000 in value. The gold is often found in large nuggets containing more or less quartz, and is also found in very small pieces or scales. The new and long ditch of the company was completed too late to be of any avail this season, but a plentiful supply of water is assured for the future. About 35 men are employed by the company from four to six months of the year. James H. Marriott is the superintendent.

The hills above this company's mines are covered with quartz veins, showing good prospects, and would prove to be good paying mines if the owners were able to properly develop them.

There are quite a number of placer mines in the district worked with rocker, sluice box and dry-wash machines that have in the years 1889-90 cleaned up a total of about \$10,000. Almost any of the side gulches will pay from \$1 upward per day to the man by the dry wash process during the dry months of the year. It is certain that better times are in store for the camp of Osceola.

Robinson Placers.

At Ely, in Robinson district, the Robinson Consolidated Gold Placer Mining Company owns some very valuable property, comprising 8000 feet by 600 feet of placer ground. The prospects of this company's property are very bright. Three shafts have been sunk in different portions of its ground, which has demonstrated the fact that there is at least 35 feet of good pay gravel from the surface to bedrock. One test containing 300 pounds of pay dirt yielded \$5 in gold. Owing to a scarcity of water, this property is now lying idle. It is expected, however, that a sufficient supply will be obtained from the drainage of the quartz mines in the immediate vicinity which will enable the company to prosecute its operations successfully. The gold product of this district for the year 1890 was \$14,000.

PROCESS FOR REFRACTORY ORES.—The London *Financial Times* gives the following description of a new patent for the reduction of refractory ores, which is being used by the Gold Ores Reduction Company of England, with satisfactory results: "The principal feature of this process appears to be its simplicity and inexpensiveness. There is nothing complicated about the method by which the reduction of refractory gold ore is obtained. The ore, having been ground to powder, is transferred into a furnace, where it is subjected to a thorough roasting by hot air, with the result that a complete oxidation of the intractable sulphurets and arsenical ores takes place, the gold being freed by these artificial means. The next step is to pass the ore—now in the condition of a fine rouge-like product—to the amalgamator, where the powder is ground with water until the gold has flown to its natural amalgam, when it is drawn off and is ready for retort distillation in the laboratory. A furnace, it is stated, can be erected for £200, and, as a rule, from each material as are to be found in the neighborhood of any mine, while the cost of treating a ton of ore amounts to something like 7s. 6d. only. The ore from the Mount Torrens mine, treated by the ordinary process, is said to yield but 5 dwts. of gold to the ton, whereas by this company's process the result is, roughly, one ounce of gold and two ounces of silver per ton—an astonishing difference in the yield."

CALIFORNIA INVESTS.—A California pool, composed of J. C. Duran, Chas. N. Fish and Jno. McComb Jr., have begun operations in Okanogan county. Through their representative, Geo. Plunder, they have just purchased the Yukon and Elgin mines in Ennes district. Both of these are prime properties, the Yukon showing a six-foot lead carrying gold and silver. The Yukon has had considerable work done on it, one tunnel having been run in 40 feet on the vein and showing 18 inches of soft carbonate. The Elgin has a five-foot vein, carrying gold and silver. The syndicate will make other investments here, but will not begin development operations until spring.—*Ruby (Wash.) Miner*.

THE long tunnel in the Bear Valley and Alessandro pipe-line was completed Tuesday. It is 2300 feet long. Six miles of the two-foot steel pipe-line are in. There are four more miles to lay.

LAST YEAR at this time the rain gauges at Mattole, Humboldt county, registered 90 inches. This year they only mark 17.24 inches.

Amalgamation at the Comstock Lode.

A Historical Sketch of Milling Operations at Washoe and an Account of the Treatment of Tailings.

NUMBER II.

[By A. D. Hodges, Jr., Read before the American Institute of Mining Engineers.]

VI. Mechanical Improvements.

Paul's Pioneer mill, so hastily planned and built, was naturally very imperfect. In the structures which followed it, great mechanical improvements were rapidly and continuously made. The stamp, which early in the '60s crushed only 1 ton per day, in 1878 was crushing 4 tons daily through No. 5 slotted screen. In his second mill, Paul used the Howland rotary battery; but this contrivance found only very limited acceptance at the Comstock. Steam-stamps were tried once at Silver City, but were adjudged a failure after a very short run. The ultimate Comstock verdict has been in favor of 850 to 900 pound stamps, dropping about 100 times a minute, crushing wet through a slotted Russia-iron screen and working on a very solid foundation. The latest mills have mortar-hocks 16 feet long.

The pan received more attention than any other part of the mill, and numberless patterns were invented and tested. It received a variety of dimensions and proportions, was used to do all the crushing, none of the crushing, only a part of the crushing; was employed to effect the complete process of amalgamation, or was supplemented with settlers, agitators, concentrators, etc. It had flat bottoms, and curved bottoms; and the wings, mullers, shoes, and dies, in short, all its component parts, were varied in shape, in accordance with mathematical theories of personal idiosyncrasies. To describe each style of pan made and tried in practical work would demand large space. Some idea may be obtained of the diversity of opinion among mill-men concerning the construction and proper work of the pan from the following list of the amalgamating apparatus in use at the Comstock in 1866:

In the 62 mills, described in the MINING AND SCIENTIFIC PRESS of Sept. 29, 1866, there were (besides 25 roasting furnaces and 61 barrels) 10 rock-breakers, 1280 stamps, 1032 pans and tubs, 227 settlers, 44 agitators and 2 concentrators.

The 1032 pans and tubs were thus classified: 83 tubs, 13 grinding pans, 337 Knox pans, 226 Wheeler pans, 188 Hephurn pans, 66 Varney pans, 24 Wakelee pans, 56 "plain" pans and 39 pans not specified.

According to the best Comstock practice of the present day, the mills are given full stamp-capacity, and only a comparatively small amount of grinding is done in the pans. The pan-construction is solid and simple. The bottom is flat and the miller is plain, with ample spaces between it and the pan-sides and pan-cone to allow free circulation of the pulp. The wings are shaped like inverted plow-shares, and the angle of draft for the shoes and dies has been determined with more or less exactness for the usual speed, but variations within moderate limits are allowed. The usual pan-diameter is 5 feet, and the usual pan-charge is about 1½ tons of ore. The gearing underneath is plain and open. The shaft is often made with a downward taper for ease in babbling, and the bearing is at least 18 inches long. The pulp is generally quite thick, and the miller-escape rapid—90 revolutions per minute for a 5-foot pan. The settlers have preferably inclined bottoms, are about 8 feet in diameter and make 15 revolutions per minute. A couple of agitators are used in each mill, but with fine grinding and careful running of the settlers, they are not absolutely necessary. It is advisable, however, to have them.

VII. Deficiency of Metallurgical Knowledge.

While with much ingenuity and thought the mechanical details of the Comstock mills were elaborated and brought to a high degree of perfection, the chemistry of the Washoe process received inadequate attention. The list of educated metallurgists who have been employed at the lode is exceedingly small. Of those who have held important positions, I can now recall only three: Louis Janin, Guido Kustel and Melville Attwood. Kustel and Attwood left Washoe about the time of the practical abandonment of the "Freiberg process." Kustel's influence there being afterward limited to whatever may have resulted from his writings; Janin remained for years, and his work (with the assistance of his brothers) produced important effects.

In explanation of the scarcity of metallurgical talent, it may be well to recall certain customs and conditions which have prevailed.

Mining operations at the Comstock have always been conducted simply as a basis for stock-speculations. The mass of the shareholders never inquired into the details of the mining-work. As to milling, it is a question if the majority ever gave a serious thought to it. They knew, in an indefinite sort of way, that it was a profitable business which was a prerequisite of the management. They felt powerless to get this plum away from the mill-companies, and "let the matter slide" as something too small for them to bother with. With a stock liable to jump up hundreds of dollars per share, they cared little about mill-profits of only a few dollars per ton. The business of the mills, they considered, whenever they thought

anything about it, was to rush through as much material as possible in order to pile up dividends and build the stock-market. The average stockholder never intended to hold his stock long. He bought with the expectation of realizing a fortune by selling out in a month or so. All this made matters comparatively easy for the mill-companies, which were close corporations and never sold a share of their stock to the general public. The mill, within certain limits, could make any terms it pleased with the mine, when the mill-owners formed the mine-directory.

The mills were popularly supposed to guarantee a yield of 85 per cent of the precious metal, but the precise form of guarantee has never been made public. Exactly what percentage they extracted, has never been discovered. No one ever knew it, neither the superintendent of the mill, nor the manager of the mine, nor any other person. Figures have been given, but these were merely approximations at the best.* There never was time enough to sample carefully and assay properly the mine-products. Such a procedure, moreover, it accepted as a rule, would have interfered materially with stock-manipulations.

After Sharon's system had been adopted, none of the mills, and only a few of the mines, had an assay-office. It grew to be a custom that there should be a single assay-establishment for all the mines and mills controlled by each "ring." Great pains were taken to conceal, from all except the favored few, the results of such assays as were made. It is a well-known fact that, in the earlier years, worthless material was often mined and milled. This must have been done to a very large extent; for the tailings of many mills where part of the ore worked was certainly rich, were found afterward to average only a couple of dollars per ton.

A peculiar custom which existed at Washoe may be mentioned here, although it does not bear directly on the subject under consideration: Reclamations on bullion which had been melted and assayed in a custom-assay office were paid by the assayer. It may be necessary to explain that the bulk of the bullion-product was purchased by a few parties who paid in full (to responsible persons) on delivery of the bullion. The bars were stamped with their assay-values (i. e. the silver reckoned at \$1.29 and the gold at \$20.67 per fine ounce), and were sold at a discount therefrom (calculated in per cent) which was made to cover charges, depreciation in price of silver, etc. If, for example, a bar was stamped with a value of \$20,000, and sold on this basis, and the purchaser subsequently decided the true assay-value to be only \$19,500, he made a "reclamation" of (about) \$500, which was paid, not by the seller, but by the assayer. The custom-assayer, therefore, was careful not to over-stamp a bar. This system had its value for the buyer, but by what process of reasoning the bullion-producer could find in it any advantage to himself, it is difficult to understand.

The system of mill returns has been much criticised of late years. To show how it originated, a brief account of the usual mill process is necessary.

The ore is raised from the mine in cars, the weight of whose contents is known with more or less exactness, and transported to the mill. Here, after the larger pieces have been reduced to a suitable size by rock-breakers, it is crushed with water under stamps. The stamped material is run into a series of tanks inside the mill and settled, the number of tanks varying with the size of the mill. The finest and most clayey particles of ore, called "elimes," are carried by the current through the tanks, where only a part is caught, while a considerable amount, in proportion dependent on the character of the ore, the fineness of crushing, and the settling capacity of the mill, escapes in suspension in the water to the outside of the building. The coarser and heavier material, which collects in the tanks, and is usually called "sand," is removed to the pan-floor, where, in the best-conducted establishments, it is sampled for assay. It is then amalgamated in the pans, whence it is discharged into settlers, where the pulp is thinned with additional water, and the amalgam and quicksilver are separated out and caught. The earthy residues, now known as "tailings," after passing through agitators for the collection of any amalgam and quicksilver which may have escaped from the settlers, are washed through sluices to the outside of the mill.

The mills work the ore at a given charge per ton crushed, and return the bullion which is extracted.

In former years the millman was unable to work the "elimes" and "tailings" at a profit, and they were allowed to go to waste. Hence, as a matter of fact, the mine received only the bullion obtained from the "sand." When, at a later period, it was found profitable to rework the tailings, and still later to work the elimes—a matter of gradual development—no change was made in the system of returns. The mine was still credited only with the results of treat-

ing the sand; the elimes and tailings were considered the perquisite of the mill. In other words, that which was caught inside the building belonged to the mine; whatever was caught outside belonged to the mill.

Under such conditions as those above mentioned—milling conducted simply as a gamble—the great mass of stockholders (anxious to realize sudden fortunes) demanding that every effort should be made to increase production without regard to cost, and caring little how much metal was wasted by rapid treatment, it only dividends could be increased temporarily, with no exact knowledge of the amounts of gold and silver in the ore, and with mills receiving a fixed rate per ton whether the material was rich or poor, and sure of supplies whatever the yield might be—under such conditions it naturally came to pass that the main object of the millman was to work the ore as rapidly and cheaply as possible, and that close amalgamation was secondary in importance. Hence it was that, while all the machinery was improved and brought to a high state of efficiency, the chemistry of the process received comparatively little attention.

The Gold Hill surface ores first worked by Paul contained more gold than silver. Much of the gold was free, and much of the silver was apparently in the state of a simple sulphide, which is reducible by quicksilver alone, the action being hastened by contact with iron under the favorable conditions existing in the pans. It is very possible that Paul might have obtained as good results without his chemicals as he did with them. However this may be, certain millmen found that they could get a high yield without any chemicals (as happened to Kustel when treating the Ophir surface ore), and others were unable to extract a satisfactory percentage either with or without them. There has always been a popular impression that all the ores from the lode have substantially the same chemical composition. Concerning the constitution of these ores, we know surprisingly little. A few analyses have been published, but these have been of specimens rather than samples. We do know, however, from milling experience, that important differences exist between the materials extracted from different spots on this huge vein, which has been opened for a length of four miles, and to an extreme depth of about two-thirds of a mile.

The early millmen, deficient in metallurgical knowledge, and ignorant of what sort of material they were treating, worked on blindly, as best they could. When they fell into difficulties, a host of process-vendors sprang up to confuse them. All sorts of substances were tried, nearly all of them of no possible virtue, and all tested by most unsatisfactory methods. As the quacks pretended to be scientific men, science soon fell into disrepute among the workers, who were unable to distinguish between the genuine and the false article, and the "practical" men, after the failure of numberless "processes," settled down to the results of their individual experiences. Bluestone and salt, either separately or jointly, always had their adherents, although for many years they were used in such homeopathic doses (in order not to "base" the bullion, against which there was a strong prejudice) that no appreciable effect could be produced. But the amalgamator who happened to make a good run when using one of these reagents was apt to remain thereafter a sturdy believer in the merits of the particular chemical employed. As each millman backed his belief with statements of percentages extracted—or supposed to be extracted—there was for a long time a confused complication of ideas concerning the values of these chemicals, which continued until the experiments with tailings, made in 1867 and 1868, by the Janin brothers, solved the problem beyond dispute. Even then, the stamp-mills did not adopt the intelligent use of bluestone and salt until about 1875, some five years after the successful introduction of the method at the Meadow Valley mill, near Pioche. Before this date, the Washoe mills, after employing various chemicals in most irrational ways, had gradually come to use merely what was deemed essential for keeping the quicksilver clean.

VIII. Early Attempts to Work Pan Tailings.

The elimes often assayed as high as the original ore; but for years they were run to waste, as no one knew how to work them with profit. The pan tailings, holding considerable amalgam, were treated more or less successfully from about the year 1864. The usual treatment consisted of concentration on blanket sluices, followed by amalgamation in pans. The blanket sluices were shallow troughs, with eldes an inch or two high, covered with coarse blankets, and set at a small inclination—6 to 12 inches in 12 feet. Two or more troughs were placed side by side; or, in the improved form, one wide blanket table was divided into several narrow, longitudinal compartments by parallel strips of wood. The stream of tailings from the mill, with an additional supply of water, was allowed to flow over the blankets, which caught and retained the heavier particles of ore and the amalgam and quicksilver, while the lighter and poorer material was washed away. The operation was aided by a man with a broom, who lightly swept the sluices, keeping the material evenly distributed and exposed to the action of the current. Two or three times a day the blankets were removed and washed out in tanks. A later and less laborious method was to leave the blankets in place, and with

*That is, to reduce the fineness of the bullion.

the aid of large amounts of clear water, to sweep the concentrates into the tanks through connecting troughs placed at the lower ends of the sluices and covered over except when in use.

There was no particular process of amalgamating the concentrates, but the procedure was similar to that employed for the ore. The richness of the concentrates consisted largely of amalgam, which fact made their successful treatment an easy matter.

The land in the main canyons leading from Virginia City to the Carson river was divided up into small properties which originally were taken up as separate millsites. Many of the mills were located in these narrow canyons, close to the water-course. Owing to the smallness of the sites, these mills, as a rule, could have only short lines of sluices, and when the treatment of blanket tailings was found profitable, the owners of land commenced to pick up the material discharged from the mill sluices above them for re-concentration in the same manner. This was done by successive land-owners, the residues being enriched by fresh supplies from the quartz mills interspersed at intervals, until finally there were almost continuous series of blanket sluices lining Seven-Mile, Six-Mile and Gold canyons. Many of the small owners put up little amalgamating works, consisting of a pan or two, or an strata, or, in a few instances, of a barrel, using small water wheels as motors. Others merely collected concentrates and sold them.

The yield of blanket tailings, in 1867, was from \$18 to \$25 per ton and aggregated over \$150,000. The cost of treatment was light, especially for the small operators who did all the work themselves and had their material delivered to them for nothing. These increased and prospered until the gradual decrease in value of the tailings and conflicts with the water company in time drove many out of the business.

The trouble with the water company arose from the insufficiency of the natural supply of water. To remedy this, water companies (afterward consolidated into one, the Virginia and Gold Hill Water Company) collected all the available supplies in the district and brought in additional quantities from outside sources, distributing and selling the water at high rates. The water company claimed that it sold to mills (and sluices) only the use of the water. Acting on this theory, the company caught up the water when discharged from the sluices of purchasers, and carried it in flumes around the property of those who refused to pay for it. The small sluice-owners claimed that it was impossible to distinguish between the natural and the artificial supply, and that, moreover, all water once in a creek were free for the use of the riparian owners. Many refused to pay and tore down the company's flumes. The dispute lasted for years and was attended with violent acts and even bloodshed. The victory finally remained substantially with the water company, which built a small dam near Silver City and led the water and tailings coming down the creek (or the larger part of them) through a long line of flumes to the Woodworth mill, which was located on the Carson river, at the mouth of Daney canyon. Here the tailings were passed over a blanket table, 1700 feet long and 19 feet wide, divided into compartments each 19 inches wide by 130 feet long. This was, undoubtedly, the largest structure of the kind ever built.

After the use of the blanket sluices had been well established, reservoirs for impounding the slimes and tailings were built here and there. Most of those in the canyon were necessarily small, but those on the flats below the ravines were large. The impounding of these materials did not occur on an extensive scale until the process for working them had been brought to a point where success seemed certain. How this process was developed will now be told.

(To be Continued.)

REWORKING OLD CINDER PILES.—The reworking of the cinder-piles of the old-time Boonton (N. J.) furnace has of late been attracting some little attention. The old slag or cinder is not being worked over for the iron it contains, but is being made use of in large quantities in the manufacture of a mineral paint. The Boonton furnace from which the cinder came was one of the earliest blast furnaces in this country, having been in successful operation before and during the Revolution, and turned out large quantities of munitions of war in that period. The value of the cinder as a source of iron is shown from the fact that 1000 tons a week are being supplied to one furnace for reworking. The visible supply is said to be not less than 300,000 tons in one place. Most of the older-piles from the old furnaces in Western Pennsylvania were reworked between 1860 and 1870 during the period of high prices for iron ore then prevailing, and it is now reported that some of these which were overlooked or considered worthless in those days are now being overhauled and made to give up the iron which in the earlier days was allowed to run to waste.

The Tacoma smelter is a great success, and since last September has been sending down to this city 750 bars of bullion every five days. Each batch of bullion is worth about \$18,000.

The average yield from 6355 tons of Cons. California and Virginia ore in January was \$15.64 per ton. The average assay value of the battery samples was \$19.34.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, Feb. 14: This grand mine, unquestionably at the head of the bullion-producers of Amador county, is moving along at a prosperous gait, under the able management of J. F. Parks, to whose judgment in its management is mainly due the fact that it stands to-day on such a solid and satisfactory basis. The north shaft has been sunk to the 1300-foot level, and the work of sinking the sump is now in progress. Much trouble is encountered on account of the volume of water; sinking does not average a foot a day owing to this drawback, notwithstanding the improved appliances for handling the water which have recently been put in. The mill is kept running to its full capacity. The rich ore is obtained from a number of small veins, which, mixed with the main ledge met with in the south end of the claim, while of low grade, is still of a paying quality, bringing the average up to a very flattering figure. The sulphurets works are not running at present, as the production hardly keeps pace with the rate of reduction. The works are able to reduce about two tons per day, while the output averages about 1½ tons. The sulphurets are probably the richest on the lode, running up to \$150 per ton. The mine and mill give employment to from 90 to 100 men.

HARDENBURG.—The crushing of rock from this mine at the mill of the Amador gold mine is completed. We are not able to give the exact result, but rumor says the yield was sufficiently satisfactory to induce those interested in the property to spend considerable more money in the effort to place it on a paying basis.

MISCELLANEOUS.—A portion of the Zeila mill is engaged in crushing rock from the Pioneer mine, which adjoins the Kennedy on the south. The ore is taken from a depth of 70 feet, and should it prove unprofitable, it will be by no means conclusive. Pay ore was not reached in the Kennedy until a depth of something like 900 feet was attained. The North Star has levied assessment No. 24 of two cents per share.

Calaveras.

THE MAUNA MINE.—*Chronicle*, Feb. 14: This mine, which is the south extension of the Dauphin mine, is situated in the Jesus Maria district, and is owned by B. K. and D. M. Mauna. Three shafts have been sunk at different places on the vein, in all of which good ore was found. No. 1 shaft on the south is down 38 feet, with a three-foot ledge in the bottom; No. 2, or middle shaft, has reached the depth of 60 feet. The ore taken from the bottom of this shaft assayed as high as \$250 to the ton. Shaft No. 3 had reached the depth of 40 feet, when it had to be abandoned owing to the lack of facilities for handling the flow of water that was encountered. A tunnel has now been started from the creek to tap the middle shaft. The developments as far as made, tend to show that the Mauna mine will prove a valuable piece of property.

El Dorado.

RICH STRIKE IN THE ALHAMBRA.—*El Dorado Republican*, Feb. 12: Years ago the Alhambra mine, in Kelsey mining district, was worked on a small scale, but the ore being very rich, a large amount of gold was taken out. Some of the owners not being practical miners, the thought of curtailing their dividends in order to create a fund for development work never occurred to them. The result was that their stopes were exhausted and money all gone. The mine then lay idle for a number of years and the timbers decaying, allowed the mine to cave in, closing it entirely. In that condition it had to wait for the coming of capital and enterprise to bring it to life again. Two months ago John M. Bryan and Sanford Hydorn bonded this property, and immediately commenced operations to open up the mine. They have sunk and substantially timbered a shaft through the old works, and last week struck the ledge at the bottom of the old level. They have sunk a few feet on the ledge and drifted a few feet each way on the vein, and are now taking out ore, showing more gold than quartz. This shaft is 70 feet deep, and they will sink it to 100 feet and then drift each way, north and south, on the ledge, when we expect to report the richest ore dump-heap that has been known in the county for many years. They have another shaft 700 feet south of the old works, on the same ledge, 54 feet deep, from which they are now taking rich ore. They have two whims, one at each shaft, for hoisting ore. Messrs. Bryan & Hydorn are feeling happy over their good fortune. The Jackson claim, situated in Kelsey mining district, has been located, abandoned and relocated many times in years past. A few months ago the Jackson Brothers of Sacramento located the ground and have sunk a shaft 30 feet deep on it in a body of porphyritic matter, with seams of quartz running through it. The fine material taken out prospects rich in free gold of a fine nature, the quartz seams are well sprinkled with free gold plainly visible to the naked eye. From indications it is believed that this vein of material is over 80 feet wide. Its present outlook is certainly very promising.

Inyo.

MINING REVIVAL.—*Index*, Feb. 11: The cheerful report reaches Independence that operations on an extensive scale will soon be inaugurated in the old Montezuma mine, which is in the foothills of the Inyo range, about six miles south of Alford on the Carson & Colorado railroad. The ore is chiefly silver lead carrying some gold and giving regular assays of fair grade. Owing to a peculiar combination of metals in the ore smelting was made difficult under the old working, and the burning of the Elina furnace some years ago resulted in shutting down the mine. It is said a large number of men will be engaged to work in the mine; that a five-stamp mill will be erected to concentrate the ore and shipments be made to Selby & Co., who are said to be largely interested in the venture.

Nevada.

DAISY HILL MINE.—*Grass Valley Union*, Feb. 11: Some tributers at work in the Daisy Hill mine have just made an important discovery. They followed a stringer that came in on the footwall of the vein, and after running on it some distance it opened out as a vein from 18 to 24 inches, being

strong and well defined and prospecting freely in gold. Some pieces taken from the vein were brought to town yesterday which showed well in free, coarse gold, and the quartz was of excellent appearance. This find may prove an important one, as showing that the true vein has been found. The Daisy Hill formerly prospected well near the surface, and considerable money was expended in putting up steam hoisting and pumping works, and in sinking a shaft and running drifts, but the work was not attended with profit and operations were suspended and the machinery removed. The mine had been idle for years, until the tribute work spoken of was commenced. The mine is now owned by E. F. Morse.

CALIFORNIA.—*Grass Valley Union*, Feb. 14: The California M. Co., incorporated to work the Pittsburg mine on Deadman's Flat, has sold sufficient of its stock set aside for a working capital to warrant the commencement of operations, and about the first of March will commence setting up hoisting and pumping machinery. The first work will be to clear out the old shaft and after that contracts will be let for sinking and drifting.

Orange.

THE EAGLE MINE.—*Orange County Herald*, Feb. 14: By invitation of Dr. C. G. Garrison the writer went last Wednesday with that gentleman, E. O. Davies and Surveyor Leslie to the mining camp in Rowell's Canyon near the head of the Santiago. We reached the mining camp about 9 o'clock and found that Dr. Garrison and son have not only a good showing of gold and silver, but what is more important, a fine "ledge" of pure water. They had been driven out of the shaft in the Eagle mine when they had gone down 70 feet. The water rose to the top of the shaft and is running over in a good-sized stream. Nothing daunted, they went down the steep hillside a few hundred yards and started a tunnel in to drain the mine. They had only gone in a few feet when water again began to appear and it is increasing as they advance. They will probably have a big flow before they reach a point beneath the shaft. They have another shaft on the same ledge which is full of water. Their mining properties are good and promise rich results in precious metals, but in our opinion their water claims are more valuable still.

Shasta.

STAR CITY.—*Shasta Courier*, Feb. 14: Twenty odd years ago a mining camp was established on the McCloud and Pit river divide, and called Star City. It is situated ten miles southwest of Bartle, and according to its location on the map, in Shasta county, and about one mile from the Siskiyou line. The camp at one time had many locators, but the ore, silver quartz in large ledge contains a great amount of sulphurets not easy to work, and the camp was abandoned by all except an old Yreka miner by the name of Stout, who has staid with his claim for 11 years, working in summer and fall in the mine, and usually coming out in winter and laboring elsewhere for wages to get supplies. The last number of the McCloud River *Pioneer* has this: "We understand that there will probably be considerable work done around in Star City and Grizzly Peak country just over the southern county line this coming summer. Stout is in the mountain 1300 feet at Star City and thinks he is close to the ledge, and expects to tap it in a rich place. We hope something of the kind will be done in this line, for a rich strike means quartz-mills, and the merry music of the falling stamps always denotes a prosperity that is not found in any other community."

NEW STRIKE.—*Redding Free Press*, Feb. 14: A new strike has been made in tunnel No. 3 of the Texas and Georgia mine. A sample of rock lies on the counter at the Bank of Shasta Co. rich in free gold and sulphurets. The ledge is six feet wide. This mine promises to be one of the best in Shasta county. B. Conroy, Judge Simonds and a gentleman from Delta, acting in the capacity of viewers of the new road from the railroad to J. B. Champion's mill, visited that section this week. From Mr. Conroy we learn that the road is about seven miles long—as fine a mountain road as can be found anywhere and with an easy grade. Within the past four months Mr. Champion has changed a quiet spot among the mountains into a hive of industry. A fine ten-stamp mill has been erected and is now in first-class running order on good-paying ore. A ditch three miles in length furnishes the water for power, and should the water give out every arrangement has been made for the employment of steam. A tramway 4000 feet long connects the mine and mill, and the ore is dumped into a bin and fed by a self-feeder into the battery. There is an abundance of ore both in the mine and on the dump. Some 30 men are employed in various capacities—getting out ore, timbering, running drifts, etc. Other locations owned by the company are being prospected. Mr. Conroy says that he has not seen anything in the county like the systematic working of this mine and mill, and every arrangement goes to show that Mr. Champion is a miner well acquainted with his business.

GOT THE ORE.—*Shasta Courier*, Feb. 14: A quartz ledge that crops out strong a few hundred yards from the town limits, and on the east bank of Middle creek, on the lands of A. Dobrowsky, has been prospected by "Missouri pot-hole" shafts and abandoned before a hole was made deep enough to bury a cat. Recently James Sutherland, late superintendent of the Niagara mine, French Gulch, and the Early Brothers took hold of the claim and put in earnest and substantial licks. The quartz taken out has been hauled to the Gem mill below town, reduced, and found to pay well. The indications now are that the mine is going to prove permanent and valuable, and that enterprise and well-directed industry will be rewarded.

PLACER MINING.—The fact that this placer mining season is a failure makes a very perceptible difference in business matters in Shasta county, as in the aggregate, the placer miners, although not making big strikes, usually put a large amount of money in circulation. The last year's mint report of placer gold-dust from this county was \$100,000. This year it will be but a small drop in the mint report. Stopping hydraulic mining on Cottonwood and Clear creek knocked this county out of considerable coin annually.

IRON MOUNTAIN.—*Democrat*, Feb. 11: For months a sale of this mountain bonanza to an eastern mining syndicate has been pending, and at last we have pretty reliable information that the sale is an absolute certainty, and all that now remains to be done is passing the deed for the money. For some months the deed has lain in escrow in

the Bank of Shasta county, while representatives of the syndicate have been examining the mine and testing the ore. A. S. J. McCoy and Fred Grotefend, through a Mr. Bryant, negotiated the sale. Mr. Bryant will arrive here in a day or so, perhaps on this evening's train, when, we understand, the sale will be closed. In connection with this big transaction we hear much talk about a large smelting works to be erected on the river in the vicinity of Copley, also a railroad from Copley to the mine. At any rate it is a fact that within the past week the new company has had men surveying around the old Kies place one mile below Copley and doing other field work, which, taking into consideration the magnitude of the mineral deposits at Iron Mountain, and the large amount of capital behind the new enterprise, strongly indicates the erection of a smelter and a railroad to the mine. This is the best piece of news we have been able to give the readers of the *Democrat* in years. The consummation of this sale means untold prosperity and wealth to Shasta county.

Plumas.

CRESCENT.—*Greenville Bulletin*, Feb. 11: The Crescent mine is running in its usual quiet way with about 50 men on the payroll, and from the amount of wood coming in it will continue to run for some time to come, which means prosperity for this pleasant little town.

Sierra.

AROUND SIERRA CITY.—*Mountain Messenger*, Feb. 14: The Sierra Buttes M. Co. has leased a portion of the water of Packer Lake to Mr. Berger, to be used in running his 10-stamp quartz-mill. The Young America mill has been shut down for a month for repairs, on account of some of the shafting needing straightening. The above mill has been running almost continuously for more than five years. R. Forbes still has a force of men at work on his new race and wheel-pit. When the wheel is in place, he will have much more power than before. The Sierra Buttes Co. have ordered lumber for rebuilding the mill at No. 7 tunnel and repairing their flume, preparatory for resumption of work in the spring. Sinking has been resumed at the Thistle shaft, down, at latest advices, 434 feet. It is expected that the shaft will now be put down to bedrock without difficulty. A. C. Busch will soon erect a 10-stamp mill at the Phoenix ledge, above Sierra City.

GRAVEL.—The owners of the Telegraph Mining Claim, of Fir Cap, are raising a shaft expecting to find pay gravel. They think the old Fir Cap channel passed over the ledge upon which they have been running, at about the point they have now reached. If they can find the old channel they will find it very rich, no doubt. The quartz in which they have run for many feet is very fair milling rock.

Siskiyou.

PROSPECTING.—*Yreka Journal*, Feb. 10: Frank H. Hall, consulting engineer and mining expert of San Francisco, is now in our county prospecting an old river channel north of Etna, which he has traced from Callahan's at the head of Scott valley, clear down to the canyon of Scott river, and thence to Scott bar, a distance of at least 40 miles. This channel is believed to average 300 feet in width and is probably 100 feet deep, extending along the west side of the valley and close by the town of Etna, through the Quartz Valley, Oro Fino, Pinery and Mugginsville districts, the present prospecting operations being carried on near Mugginsville. It is believed that the prospecting now in progress will be the certain existence of this channel, to create a boom in Siskiyou mining never before excelled in any section of the Golden West. Mr. Hall has also been prospecting to some extent in the Salmon river section, and believes there is a grand future for Siskiyou in quartz and placer mining, and that the richest gold deposits are deeper down than any mining yet carried on in the county. Lee, Lash & Co., having completed a drain to the pump shaft sunk deeper down, at their blue gravel claim on Greenhorn creek, about a mile south of Yreka, are now working a large force, realizing about \$16 a day to the hand. They have an immense body of blue gravel varying from one to six feet in depth, with bedrock pitching westward under a hill, indicating that the hill is a slide into the old channel from the high range of mountains which extend from the Siskiyou range at the Oregon boundary throughout this entire neighborhood to Salmon river on our southern border, and to the New river district in Trinity county.

NEVADA.

Washoe District.

YELLOW JACKET.—*Virginia Enterprise*, Feb. 14: Shipping 45 tons daily of ore worth \$19 a ton, as per battery samples. East crosscut No. 1 on the 800 level is in six feet in fair grade ore. East crosscut No. 2, same level, has not yet reached the vein.

SEC. BELCHER.—The 600 level, south drift, has been extended to the south line; total distance, 164 feet. Have started an east crosscut from near the south line, which is out 16 feet; face in soft porphyry.

KENTUCK.—Have completed the airway in the raise on the 1000 level, east ledge, and advanced the raise 7 feet. It is now up 21 feet above the track floor. The top is in low-grade quartz, with stringers of pay in it. The 1000 raise in the west ledge was connected with the bottom of the 950 winze. The north drift on this level in the west ledge is advanced 11 feet, and is out 25 feet from the main east crosscut. The face is in low-grade quartz containing spots of ore.

JUSTICE.—The north drift, on the 822 level, is in 299 feet. The face is in hard rock. The south drift from No. 2 winze, 490 level, is out 125 feet. The face is in fair grade ore. Shipped to the mill during the week 116 tons 880 pounds of ore. Average battery assay \$18.50 per ton.

BELCHER.—The raise from the 200 south drift is up a total distance of 54 feet, having advanced 16 feet during the week. The top is in a mixture of clay, quartz and porphyry. Started No. 3 west crosscut from the south drift in the west ledge, 300-foot level, which is out to-day 40 feet. It has passed through and the face is still in a mixture of low-grade quartz and porphyry. The 1400 east crosscut is out 36 feet. The face is in porphyry and quartz giving low assays.

CON IMPERIAL.—The work of following up and taking out small streaks of ore on the upper levels and overhauling the old stopes of the mine is still being carried on.

CROWN POINT.—The west drift on the 500 level is out 42 feet. The face is in porphyry. Are making some necessary repairs on the 600 level and continue to extract a little ore from the 1300 stope.

OVERMAN.—Have extracted 352 tons of ore. Car samples average \$13.85. Shipped to Brunswick mill 380 tons of ore; battery samples average \$15.77 per ton. On the 1200 level, upraise on north-east drift has been extended 18 feet through quartz. Total length, 52 feet.

CONFIDENCE-CHALLENGE.—The north drift on the 300 level is in 181 feet, 9 feet having been made during the week. The face shows quartz having no value. This drift is 50 feet in Confidence ground. The joint Confidence and Challenge raise from the 750 level is up 163 feet, having been advanced 9 feet during the week. The top shows quartz having no value. The joint Challenge and Confidence west crosscut from the north drift on the 1100 level, is out 155 feet. The face shows quartz having no value.

HALE & NORCROSS.—On the 800 level the east crosscut started opposite west crosscut on our north boundary is advanced 45 feet; face in quartz carrying seams of low-grade ore. On the 1100 level the east crosscut on our north boundary line was advanced 30 feet; total, 190 feet; this crosscut is passing through a solid body of quartz of a grade too low to pay. No. 2 west crosscut started from the south lateral drift 55 feet south from the 1400 station is extended 60 feet; 80 feet north from No. 1 west crosscut on this level we have started No. 3 west crosscut and extended it 20 feet; face in quartz carrying bunches of fair-grade ore. No. 2 east crosscut started 60 feet north of the 1400 station is extended 85 feet; 25 feet made during the week. Eighty feet north of this crosscut we have started No. 3 east crosscut, which is advanced 20 feet.

SAVAGE.—During the week we have hoisted 610 carloads of ore from the 400, 500, 750 and 1300 levels and from the winze below the 1300 level. Milled 610 tons of ore, the average battery assay of which was \$14.60 a ton; bullion on hand on February account, \$6824. The north upraise from the 300 level is carried up 95 feet; top in low-grade ore. On the 400 level the intermediate east drift was extended 32 feet; total, 72 feet. This drift discloses nothing yet of practical value.

CHOLLAR.—Winze 80 feet south of north line, 750 level, is down 71 feet, bottom in clay and quartz. The east drift from the incline station, 1400 level, is out 30 feet; face in porphyry. Sent to the mill the past week 544 tons of ore worth \$19.02 a ton as per battery assays.

POTOSI.—No work was done in the winze the past week. The east crosscut south of incline, 1230 level, is out 130 feet; face in porphyry. South lateral drift from Chollar incline, 1300 level, is out 636 feet; face in porphyry.

EXCHEQUER.—East crosscut near the south line, 600 level, is out 304 feet; face in porphyry and clay. East crosscut on the north line, 600 level, is out 87 feet; face in hard porphyry and clay.

ALPHA.—South drift from crosscut east of shaft, 600 level, is out 51 feet; face in quartz, yielding fair assays.

UTAH.—On the 725 level the northwest lateral drift from the main west drift from the shaft has been extended 14 feet; total length, 418 feet. Near the face of this drift, or 150 feet northwesterly from west crosscut No. 1, west crosscut No. 2 has been started and advanced 36 feet in a porphyry and clay formation.

OCCIDENTAL.—During the week the whole force has been engaged in repairing and retimbering the main tunnel on the 550 level, which is about completed, and prospecting at several new points will be commenced during the coming week.

ANDES.—East crosscut from south drift on 420 level was advanced 18 feet; face in clay and porphyry.

Hawthorne District.

PANLICO ITEMS.—*Walker Lake Bulletin*, Feb. 11: A correspondent writes as follows from Hawthorne District: A rich strike was made in the Western Belle mine, owned by Hank Taylor and Joe Gilman, on the 6th of February. The discovery was made on the 6th day of this month by Hank Taylor. Col. Curtis is superintending operations. The ledge is two feet wide and averages \$100. The Lapanta, the best mine in the district, is looking well. J. Warner has lately taken a lease, and his prospects of making a stake are good. Other mines here are looking well. The lessees of the Gravel mine are in high spirits, and say they will come out all right in the spring. Rattlesnake John (better known as High Water O'Brien) owns the Moonshine. He says the gold is very coarse and a good ways apart. He is sinking and expects pay when he strikes the water level. The Mountain King is being worked by C. Blair and Badger Bill, and the prospects are good. The Pamlico lessees are making a living, and the lessees of the Striker mine have no growl coming.

Pioche District.

DRAFTED.—*Pioche Record*, Feb. 14: The mining company drafted a number of men at their outside mines this week. At the Half Moon 13 men were laid off, and about half the force at the Mendha. The anticipated closing down of the furnace is supposed to account for the action.

ARIZONA.

TO START.—*Prescott Courier*, Feb. 13: The company that recently purchased the Catocin from its old owners have given orders for work to start right away. Paul Johns, one of our best men and miners, will be in charge. Teams with tools, provisions, etc., are en route to the mine, which is in Hassayampa district, some 14 miles southwest from Prescott.

GOLD.—John Hartin of this town is a well-pleased individual. A short time ago he and J. J. Fisher, member of the House from this county, became possessed of small gold-bearing croppings, near D. Walker's, about seven miles west of Prescott. They commenced sinking upon the small development, which has kept growing, as it were, until it is over seven feet thick, at a depth of 35 feet. The ore is rich in gold; Hartin says it is free milling. The entire ledge has sampled about \$20 in gold to the ton. Some pieces of ore show a great deal of gold. A sample of the richest proved that it would mill over \$200 a ton. The owners are among our best citizens, and it affords the *Courier* pleasure to say that while they are not "stuck up," they feel their gold, not their oats. Wm. Ronald returned home recently from Eureka district. He examined

the Hillside, Parnell, and other veins, and thinks well of them. He likes the section so well that he intends settling on it. Miners of Castle Creek and Tip Top are taking out ore with their usual vim.

TIP TOP.—Cor. Arizona Journal-Miner, Feb. 17: Placer mines on Lower Humboldt have lain idle all winter for want of water. Henry Wager is working on the Basin mine, near the Old Silver Museum, 1½ miles east of Tip Top postoffice. Quite a force of men is at work building a good road into Upper Tip Top, to afford facilities for the increasing chloriding work in that locality. Humboldt, at Furley's camp, contains plenty of water for power or any other ordinary purpose, and more men are at work here than usual. Messrs. Sinclair, Yokum, Thompson, Champie, Farley and Kay, besides a half dozen strangers, are taking out what seems to be fine chloriding ore, running from \$25 to \$400 per ton. Ten teams went north over the New Bradshaw road last Sunday to bring concentrates from the Crowned King. This is about the first regular introduction to business since the road was completed.

BRITISH COLUMBIA.

THE LAKE COUNTRY.—Nelson Miner, Feb. 7: The people of Kootenay Lake country should have no hesitancy in inviting outside capitalists, miners and business men to take a hand in developing the resources of its several districts. Mining cannot successfully be carried on in British Columbia without reduction works, and reduction works without the production of fuel; neither can be carried on without timber, much of it manufactured. Along with reduction works and sawmills and boiling works will come foundries and machine shops, possibly not extensive plants but large enough to give employment to a hundred or so skilled and unskilled workmen. Have we the foundation on which to uphold these industries? The question can now have but one answer. The Blue Bell at Hendryx is pronounced a mine by thoroughly competent mining men; the surface indications of mines in Hot Springs district cannot be disputed; the fact that thousands of tons of ore are exposed in Toad Mountain district is the best evidence that can be presented as to its merits; that Goat River has claims that prospect well has been demonstrated by actual work; and, although not in the Lake country, Trail Creek district promises to be second in importance to but few in the province. Additional evidence is the fact that the country has produced and shipped ore and gold dust and bullion in the aggregate a sum equal to the sum expended in ore extraction and development work.

PROSPECTING ON THE NORTH SIDE OF THE KOOTENAY.—A party left Nelson to-day for the head of Grohman creek, to prospect the large ledges that are there exposed. The formation is granite, the ledge matter quartz carrying galena. The district is on the north side of the Kootenay, and not more than four miles distant from Nelson.

COLORADO.

SAMPSON.—Silverton Miner, Feb. 6: The Sampson, we learn, is about to pass into the hands of a Welsh syndicate now in process of organization under the direction of Chas. E. Jones and L. W. Morgan. This is the most gratifying piece of news we have heard this winter, and if the gentlemen mean business there is a bright season in prospect for Cement creek. The Sampson in operation means hundreds of prospects being worked by prospectors and the uncovering of more new mines. The Sampson is a large gold-bearing vein of mammoth proportions. Being opened for hundreds of feet in the way of lateral drifts along the vein, showing vast bodies of free-milling quartz, the mine is in shape to employ 100 men, and hardly a limit can be placed on the output. Being fitted with a powerful wire rope tramway which works on the gravity system, the ore can be delivered automatically under the stamps in the company's mill at a cost not to exceed 25 cents per ton. The capacity of the tramway is 150 tons and the capacity of the mill—25 stamps of 850 pounds each—75 to 100 tons daily. The lowest grade ore that ever went through this mill averaged \$11 per ton, while the average of the whole product is in excess of \$18 per ton. With such a layout as this we do not see what is to prevent this mine from becoming a profitable investment, unless it should be afflicted with incompetent management.

CHAMBER.—Preparations were made this week to cut out the large chamber in the North Star crosscut, which is to be used as a machinery room for the big shaft which is to be sunk this year. The machinery is to consist of a large hoisting and pumping plant driven by two large dynamos of 100 horsepower, the electricity to be generated by Pelton wheels at the mouth of the tunnel. The chamber will be 50x30 feet, 35 feet over the shaft and sloping off to 15 feet at the low end. The excavation will be done by contract and the cavity substantially timbered. The chamber will be nearly 2400 feet from the mouth of the crosscut.

THE IOWA.—Aspen Times, Feb. 11: The Continental Divide Mining Investment Co. has taken an 800-foot contract of the Iowa and Smuggler Mountain Mining Co. to do 800 feet of work on the Iowa mine. Some of the work will be done by drifting from the Bushwacker workings and the balance will be done in the old workings of the Iowa.

THE HIGHLAND CHIEF CO.—This is a new mining company and is the owner of the Pyramid lode claim located nearly a mile south of the Little Annie mine on the main blue and short line contact. The company also owns a portion of the Highland Chief lode and has an 18-months lease and option on the Matchless and Lackawanna Boy claims. Pay ore was found in the grass roots over the Highland Chief, but it proved to be a slop-ore from the apex and lodged in the blue lime. A shaft was sunk into solid blue lime, then a drift run east to catch the contact next to the dolomite. George Besser, who is the foreman for the company, thinks that he now has the vein in place, and expects to be shipping ore in a short time by sinking.

THE WILMINGTON.—Wheeler and Nugent, who have been running a tunnel from west to east on the Climax group, have gone through the porphyry and 50 feet of fine blue lime and cut into dolomite. There was found to be no mineral in the contact; drifting has been started to see if it will open into an ore chute. Some people are of the opinion that the dolomite encountered is only a narrow band and

that there is more blue lime and the main ore contact is east. The projectors of this enterprise are somewhat weary.

DAKOTA.

CARBONATE.—Deadwood Pioneer, Feb. 12: At the Iron Hill some very rich sulphurets have been struck in one of the exploring drifts, a chunk of which we were shown is very fine and easy enough seen to be the pure metal. It is said that they have several large ore bodies of both smelting and dry ore already explored, and the approximate amount which they have in sight gives them enough mixed with the ores of their other mines to run the reduction plant almost indefinitely. This company is in the business for making money, and will compete for the custom ores of the country. When needed, other stacks, or even a chlorination plant, will be added to the 20-stamp silver mill. The Albe is working four men, and has been taking out some very fine chloride of silver ore, of which we were shown some very fine specimens on their ore dump. They are timbering the lower part of the shaft. When this is finished, the work of extracting ore will commence and prospecting will also be continued. The Transit is looking immense. The ore is what is called dry, and is located in the shales, lies nearly flat with a dip of about ten degrees toward the northwest. The ore body is exposed for a distance of 75 feet by several open cuts, and varies from four feet to eight feet thickness in the thickest part. The Red Rock still continues to look well, and the owners are piling ore on the dump. The U. S. Grant folks are getting out a lot of good ore on their property.

LITTLE ELLEN.—Work on this property is progressing, and some fine pink and blue quartz has been encountered.

WHO-HA.—The Who-Ha mine at Ruby Basin now shows an excellent body of ore, and developments on it only serve to increase the body. The claim is owned by George Hopkins and Dr. Collins.

LOWER CALIFORNIA.

ALAMO.—Lower Californian, Feb. 12: The hoisting works of the San David are almost completed. The big hoisting engine at the Telemaco will be moved down on the San David soon. A large pump will be set at work then, as the location of the mine is favorable for catching all the waste water in camp not already caught by the Montezuma. Another great place for water is the section of the Gold Tree where Gastelum made his stake. It has been temporarily abandoned but it is too rich to lie idle long. This matter of too much water is a strong drawback to Alamo's rapid development. Kelley, late night boss at the Princess, has taken a contract to sink an additional 100 feet on the Ulises. He has a force of men at work. The Aurora mine and mill are working night and day and the ore is very rich. Sinking is steadily advancing, as well as drifting. The El Paso, Alamo and Scorpion mills are working. Among the mines being worked are the Aurora, Indio, Uhss, San David, El Paso, Gold Tree, Scorpion, Tarantula, Montezuma, Arabella, Gen. Torres, Van Tassel and Rattlesnake. Placing is going on in many places and Wescott and partners, in Mexican guile, have built a flume and are almost ready to hydraulic. J. B. Blethen is expected this week to settle the affairs of the Montezuma Co.

MONTANA.

MINES OF NEIHART.—Butte Miner, Feb. 16: Ed. Berge and Gus Damm are rejoicing over one of the best strikes made on Carpenter creek for many a long day, says the Helena Herald. In their Flansburg lode at a depth of 72 feet, they started a drift, and in going about six feet encountered four feet of galena and carbonates. Fisher and Walley have struck a fine body of galena and sulphurets in their Raven lode on Snow lead. It is understood that Armstrong and Sticht are now in Barker fixing up the old smelter, preparatory to "blowing in" next week.

BONDED.—The Despatch mine, located just west of the Valley claim and south of the Star West, has been bonded by George and William Farlin to Eastern parties for \$50,000 in case the bond is taken up within six months, and \$75,000 provided it stands one year. Work on the property will be commenced at once under the supervision of J. H. Maloney of the firm of Cobban & Co. The parties who have bonded the Despatch are also figuring on the Valley claim, and no doubt both will be producing in time if there is anything there to be produced.

BALO MOUNTAIN DISTRICT.—Phillipsburg Mail, Feb. 11: About 20 miles in a southwesterly direction from Phillipsburg lies the above-named mining district. It is just inside the northern line of Silver Bow county, but owing to the contour of the country this is the only available outlet, although, of course, all locations must be recorded in Silver Bow county. The formation of the country is lime and porphyry, and the veins all take an easterly and westerly course and dip to the south. Frazier and Carpp have the best developed property in this section at present, and the names of their claims are the Monarch, Sun and Forest Pine, and there is no doubt but that if these claims were close to some organized district one or more large companies would be at work on them. Adjoining the above claims Henry Maloney & Co. have what from present developments would appear to be not only the best in the Bald Mountain country, but a first-class producing mine. A couple of carloads of high-grade ore have already been shipped from this claim, and the deepest shaft is only a little over 80 feet, and some very rich specimens of gray copper ore are on exhibition in this city from it.

NEW MEXICO.

COOK'S PEAK ITEMS.—Southwest Sentinel, Feb. 14: The El Paso Smelting Co. is now working three claims—the Monte Cristo, Otobello and Desdemona. In driving a tunnel a large cave was struck, which has been explored for a length of 75 feet. It is from 30 to 40 feet wide. A very large quantity of fine ore has been found in it. A sample of 25 pounds has been tested and gave returns of 50 per cent lead. The tunnel is being driven ahead over the cave. Cook & Paynter have been jigging, and will soon have several cars of concentrates to ship. Tell & Poe are shipping regularly at the rate of about four carloads a week. J. A. Hinton has just

let a contract for 150 feet of work on his Georgetown mining property, and has also given a lease on part of it.

LONE MOUNTAIN.—Silver City Enterprise, Feb. 12: The Good Luck mine, belonging to Brockman & Beall, has within the past week assumed a new appearance. The walls have become regular and even, and the trend and dip in the vicinity of the ore-chute first discovered have become more definite. The body of first class ore now in sight is fully three feet in width and assays more than \$200 per ton average value. Alongside this is a large body of lower-grade ore which can be milled at a profit on the ground.

PIÑOS ALTOS.—At the Alpha and Omega, better known as the Huson and Thomas mines, the lessees, Professors Carrera and Doheny, have uncovered bodies of ore of greater magnitude than ever found so near the surface in any of the great mining districts of Colorado. The ore averages over 20 ounces per ton in silver and \$2 to \$4 per ton in gold, with 12 to 16 per cent lead. There is now on the dump at the mine 1000 tons of ore. Before the smelter combination went into effect, the ore was returning from \$250 to \$400 per car profit, but the raise in smelting charges has been so great, and present prices of smelting so exorbitant, that the owners and lessees are now considering the feasibility of starting a smelter at Silver City.

MORE STAMPS.—Silver City Enterprise, Feb. 12: The Mountain Key M. Co. have about completed the erection of an additional five stamps in their mill, which gives them a 15-stamp mill. This was rendered necessary by the accumulation of ore reserves in the mine. While development work has been extensively engaged in, the 10-stamp mill has been unable to reduce the ore in reserve in the slopes. With 50 per cent increase in milling facilities a large increase in production and net profits will be the result. Regular dividends may now be looked for. The new stamps will probably be started next week.

ALHAMBRA CAMP.—There is a rumor, probably well founded, that the Black Hawk mine will be worked with a full force of men as in days of old. This is one of the mines of Grant county which has contributed great quantities of native silver to swell the output of the precious metal. The Alhambra mine in the camp of the same name is "in bonanza." The new shaft is still in the rich ore chute encountered months ago, and is paying a handsome profit over and above cost of sinking. This is something that but few mines do, to pay a profit on development work.

OREGON.

THE BAILEY-ELKHORN.—Bedrock Democrat, Feb. 9: A smile will beam over the countenances of the Portland stockholders of the Bailey-Elkhorn Mining Co., operating in Baker county, when the January output of gold bullion is received by them at the head office, and they will be more than ever convinced of the necessity of a large reduction plant on their property. Yesterday there arrived at the First National Bank, of this city, the January output of the Bailey-Elkhorn mine, \$75,000, or two gold bricks weighing 79 pounds, the result of two Huntington mills. The output will be expressed at once to the U. S. mint for coinage. Mr. Oliver, superintendent of the company, when in this city a few days ago, made a guess that \$12,000 would be the amount for January, and its being exceeded by \$3000 is a matter of no little gratification. With a dozen or more mines in Baker county yielding as handsomely as the Bailey-Elkhorn there would be prosperity on every hand and dull times would be something unheard of. But that time will come just as soon as practical miners take hold of the hundreds of promising mines in this section. There has been altogether too much talk and too little work.

UTAH.

SILVER REEF.—Salt Lake Tribune, Feb. 11: Knowing that Mr. Judd was interested in mining in Silver Reef, the reporter asked regarding that old silver-sandstone district. He says the prospects are brighter at Silver Reef than they have been for many years. In the old Stormy King mine, owned by the Christy Co., the developments have been extending northward from the new shaft into new country, and it now shows up as well as it ever did in that property. Woolley, Lund & Judd have been running the Barbee & Walker mill in which they worked 1000 tons of ore averaging about 18 ounces silver to the ton. They have also been running the Christy mill part of the time. The ores crushed were raised by chlorides, who have been doing well, in fact, as well as ever miners did in that camp. About 40 miners are working in the district. Mr. Judd is of the opinion if the mines there, now belonging to three companies, were thrown into a corporation, that mining could be carried on to large extent, to good profit, and that Silver Reef would become a better district than it ever has been.

STRIKE AT STEWART NO. 2.—Out at the Stewart No. 2, Bingham, a strike was made two or three days ago on ore that assays about \$700 in gold, and this rich chute is eight feet wide. It is honeycombed quartz and located about 400 feet below the surface.

THE GIPSY BLAIR.—Cheering news comes from the Gipsy Blair mine at the head of Big Cottonwood. Late developments are bringing out the property. The shaft is down 100 feet, from which a drift at the bottom has been run 70 feet and this has cut a chute of ore 16 inches wide, which runs very high in silver. Previous assays of ore from other places on the vein ran from 200 to nearly 500 ounces, but ore from the late strike has not been assayed, although it looks as if it will run well in metal. Five persons are employed this winter on development work, and it is proposed to put on a large force in the spring. The late strike pleased Mrs. Vandebarker so well that she organized a party, consisting of herself, Wm. Wedlake and Robert Knows, to come down and bring the news. They put on their snowshoes on Tuesday and boldly pushed out over the snow, which is about 15 feet deep at the head of the canyon, but gets thinner all the way down. At one place their movements started a slide, but they were not caught in it. At other places they glided over the snow where there were big cracks, and had to move with caution to prevent starting slides, and at one time the lady lost one of her snowshoes and it was recovered with difficulty. But they reached this city in safety yesterday, well tired out from their perilous journey down the canyon.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEB. 10, 1891.

445,376.—DIVIDER ATTACHMENT FOR MOWERS Mark Anthony, S. F.
445,221.—CABLE RAILWAY—L. M. Clement, Oakland, Cal.
445,249.—CHAIR—Julia W. Craig, S. F.
445,227.—STREET-CAR FENDER AND BRAKE—Geo. T. Hall, Moravia, Cal.
445,350.—LENSES FOR ILLUMINATING TILES—P. H. Jackson, S. F.
445,352.—BORING MACHINE—A. M. Jewell, S. F.
445,353.—BORING MACHINE—A. M. Jewell, S. F.
445,234.—THRASHING MACHINE—E. McDonald, Willows, Cal.
445,351.—BRAKE FOR CABLE CARS—J. F. Waite, S. F.
445,240.—CAR COUPLING—G. W. Weller, Baker City, Or.
445,275.—AIR-SIGNALING APPARATUS—G. B. Williams, Portland, Or.

The following brief list by telegraph, for Feb. 13, will appear more complete on receipt of mail advices:

California—George B. Baer, Cloverdale, mailing machine; Stephen S. Black, assignor of one-half to E. A. Cochran, Pasadena, skate; William H. Burns, Los Angeles, carbon for electric lamps; William M. Craig, Santa Ynez, windmill; Edwin Deponore, Coronado, veneer cutting machine; Joseph W. Fawkes, Sr., and J. W. Fawkes, Jr., Burbank, card-exhibiting device; Richard E. Jeffery, Grass Valley, vehicle wheel; Larena A. Johnson, San Francisco, fish net; William A. Judge, Santa Barbara, index; Ezra W. Keeler, San Francisco, panoramic device; Elizabeth T. Mabi, Alhambra, apparatus for delivering clay to sewer-pipe presses; Andrew G. Phillips, San Francisco, a feed; William T. Y. Schenck, San Francisco, hose reel; Stanley B. Whiteside, San Francisco, mailing machine; Henry N. Williams, San Francisco, compound for paving, roofing and building purposes; William Wright, New York, assignor to Wright's Denver and San Francisco Electric Light Company of Colorado, battery compound.

Oregon—Lizzie Graham, Portland, floor-washing machine; John H. Krouse, Portland, wiring attachment for baling presses; John B. Walker, Corvallis, railway joint.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ADJUSTABLE LETTERING DEVICE.—Lewis A. Gates, S. F., assignor of one-half to Henry J. Postel, Sacramento. No. 445,750. Dated Feb. 3, 1891. This "adjustable lettering device" consists of a framework having a series of horizontal parallel wires, and in connection therewith of letters, figures or characters having flexible extensions or spurs, which are bent over so as to engage the wires and hold the letters or characters at any desired point. The letters may be placed upon the wires at any desired point so as to form signs or other advertising or ornamental work. They are easily removed by simply compressing the wires upon which any letter is hooked toward each other, when they may be unhooked and taken off, and their positions changed or other letters substituted. By this construction and style of letter any change of sign may be had, the frames being always useful for any sign that it may be desired to make.

FRUIT-FITTING MACHINE.—James T. Ish, S. F. No. 445,753. Dated Feb. 3, 1891. The object of this invention is to provide a machine of this class in which both the flesh of the fruit and its pit are cut through and the latter removed. The fruit is placed in spring holders of an arm which, swinging upwardly, delivers it between traveling opposing cups, the cushion-holders of which retain it. The fruit is then brought into contact with the stationary knife, and a revolving knife coming up behind it at that instant, both the flesh and the pit are cut into halves. These pass on each side of and in contact with a directing plate and curve around its end branches. Then when opposite the nippers, their peculiar action extracts the severed pits.

BRAKE FOR CABLE CARS.—James F. Waite, S. F., assignor of one-half to Wm. Hollis. No. 445,305. Dated Feb. 10, 1891. The object of this invention is to provide a simple and effective brake, of that class in which the slot irons are acted upon as a frictional resistance or contact. The invention consists in the novel brake and means for hanging and operating it.

LENSES FOR ILLUMINATING TILES.—Peter H. Jackson, S. F. No. 445,350. Dated Feb. 10, 1891. This invention relates to the class of lenses to be used in cement, concrete, or other plastic material, when applied to illuminating tiles for sidewalks, floors, roofs and the like, for illuminating apartments beneath. The invention consists in the novel lens and in said lens in connection with the surrounding material in which it is imbedded.

BORING MACHINE.—Ammi M. Jewell, S. F. No. 445,352. Dated Feb. 10, 1891. This invention relates to the general class of boring machines, and particularly to a machine for boring the stiles of doors, blinds and sashes. The object is to provide a suitable machine for boring holes in such stiles, whereby they are adapted to receive dowel pins, which are also let into holes in the rails of the doors, blinds and sashes, whereby these articles are put together by dowels instead of mortises and tenons.

BORING MACHINE.—Ammi M. Jewell, S. F. No. 445,353. Dated Feb. 10, 1891. This is a machine for boring the holes in both ends of the rails of doors, blinds and sashes to receive dowel pins, whereby said rails are connected with the stiles instead of by the usual mortises and tenons.

MECHANICAL PROGRESS

Abrasive Cutting.

At a recent meeting of the Technical Society of the Pacific Coast, the principal feature of the evening was an essay on the subject of "Abrasive Cutting in the Mechanical Arts," written by John Richards, and, in his absence, read by Otto von Geldern. The essay was in part as follows:

"Cutting is divided into two classes, direct and abrasive. The direct process is by means of edges, applicable to soft material, and abrasive applicable to hard material.

"Abrasive cutting is performed by means of wet stones, sand, emery, glass, corundum, crocus, rouge, and in some cases by soft iron alone. Chief among these methods is that of wet stones or common grindstones, which form a more important part of converting implements than is commonly supposed.

"The principal development of wet-stone grinding, that is, gage grinding, has been in the large saw and tool factories. I do not mean hand-grinding. That is simple enough, but gage grinding has been the subject of a great amount of ingenious effort by highly skilled mechanics, who have not carried their knowledge beyond the works where it was applied.

"There is not little dry grinding done in this country, and so far as known only on stones brought here from England. It may have been noticed that the shafts of tools brought from England, chisels for example, are ground crosswise and are very rough. This is done on small stones driven at high speed, called 'shank stones.'

"Abrasive cutting by heat consists in applying smooth disks of steel or iron, driven at high speed, to pieces to be cut; the heat developed by friction being sufficient to melt the metal in contact with the wheel, or, what is more probable, softening it to a plastic state, so it is rubbed away by the wheel.

"Grinding is a process of accuracy. In metal working the operation of cutting has a limit of accuracy at 1-1000 part of an inch in coarse work, and 1-200 part of an inch in fine work. All accurate and all polished surfaces are finished by abrasive operation."

THE "COLD SAW" METHOD.—The *Iron Age* comments upon this as follows: That the general adoption of the "cold-saw" method of cutting metals will depend wholly and primarily upon the character of the machine introduced for doing the work, is a foregone conclusion. That this method, which in reality employs a thin milling cutter of comparatively large diameter, is well adapted to meet every requirement satisfactorily, is beyond dispute. The introduction of the machine and its displacement of the rapidly-revolving saw now used will depend upon two things—the method of mounting and of driving the saw. The controlling factors are identical with those governing the construction of the ordinary milling machine, of which this is only a modification. Rigidity is the first and most important requirement. There must be sufficient strength to prevent absolutely any yielding, since the smallest degree of elasticity would be fatal to good results. The driving gear should be correspondingly powerful. These qualities obtained, the adoption of the cold saw will follow speedily. The machine of this description possesses great advantages when compared with the one now employed. This is particularly apparent in the character of the work done by both. The old machine can only be used on rough work; the cold saw can be used for fitting where great accuracy is demanded, as in bridge and ship building establishments especially, and it is here that its vast superiority is most manifest. In addition, it requires less power to be operated, the wear and tear is much reduced, and these points, together with the greater accuracy mentioned, more than counterbalance its slower cutting speed. These tools are used somewhat extensively in England, and their adoption here depends, as mentioned, solely upon good design and construction.

A WONDERFUL ALLOY.—A copper aluminum alloy, says the *Engineer*, has lately been tested at Chalais, in the department of aerial navigation, with some surprising results. Nearly pure aluminum and ordinary copper conducting wire were alloyed and rolled into sheets 1 mm. thick, and from these, strips were cut 5 mm. wide. The results of the various percentages in the alloy on trial showed that the addition of only two per cent of copper increases the tensile strength of aluminum from about 37,000 to nearly 44,000 pounds per square inch, and the addition of six per cent of copper more than doubles this tensile strength. It will be also noted that an alloy can be made having double the strength of pure aluminum that is less than one-twentieth heavier than the pure metal. As the *Engineer* remarks, experiments on so small a scale are no guarantee that an alloy of equal qualities could be made on a commercial scale, and further experiment is necessary to the general behavior of this alloy; but it is interesting.

A NEW DYNAMITE GUN.—The United States Government has authorized a test at Fort Sheridan on a new gun 9½ feet long, which is said to be capable of throwing dynamite or other high explosive shells a distance of five miles

thousands of times in succession without becoming overheated. The inventor is Louis Gathmann of Chicago. The chief novel feature is the use of liquefied carbonic acid gas, delivered automatically along the entire length of the bore at the instant of discharge, not only as an absorbent of the heat generated, but as a "cooler" after the charge has left the gun. By another device, pneumatic pressure is produced with powder. Should the invention prove a success, Gathmann expects that the existing systems of coast defense would be revolutionized.

ALUMINUM STEEL ARMOR PLATES.—Some interesting experiments, says the *American Manufacturer*, are being made at the works of the Carbon Iron Co., in Pittsburgh, by which it is expected that the possibility of making armor plates of aluminum steel may be demonstrated. The fact that a small percentage of aluminum in steel increases its strength is well known, and with this in view, the experiments mentioned above have been undertaken. The company is now engaged on a government contract for armor plates, and by introducing about one-fourth of one per cent of aluminum into this steel, some satisfactory results have been obtained. An ultimate strength of 105,000 pounds has been reached, and the metal showed remarkable toughness and ductility. With an ordinary steel plate, when a tensile strength of about 100,000 pounds was obtained, the amount of carbon would necessarily be about three-quarters of one per cent, which would render the steel too brittle for armor. The high price of aluminum is the present drawback to its extensive use, but it is thought that by another year the price of a grade of aluminum pure enough for the purpose can be manufactured for less than a dollar a pound, which will place it more within the reach of steel-makers. The present experiments at the Carbon Iron Works will be continued for some time, until it is established whether the project is entirely feasible.

IMPROVED JOINTING OF IRON SURFACES.—It is found that a permanent and satisfactory joint can be effected between rough cast-iron surfaces by the use of mineral asbestos mixed with sufficient white lead to make a very stiff putty; this, it is ascertained, will resist any amount of heat, and is so unaffected by steam or water as to be serviceable for mending or closing cracks in cast-iron retorts employed in the distillation of oil and gas from canal coal. The heat being applied to the bottom of retorts and the temperature of the iron maintained at a bright-red heat, after a time the bottom of the retort would give way, the larger portion of the crack being downward toward the fire. The method employed was to prepare the mixture and place it on top of a brick, then put the brick on a bar of iron or a shovel, and press the cement upward to fill the crack in the iron, holding it up for some time until it had penetrated the cavity and become somewhat set, necessarily, during this operation, the lid being removed from the retort, so that no pressure of gas or oil should force the cement outward until set. The use of asbestos in this way possesses various advantages, not the least of which is that the substance cannot burn.

WATER METERS AND POWER METERS.—It was a long time before water meters became universal, but they got around at last, and how easy it is to tell when water is going to waste or a half-valve needs packing, and so with gas. The least leak about the building is shown at once in the meter, but with the power that is being supplied to a machine shop, nothing is ever done but to guess at it. This is a mistake, as a meter for this purpose is easily made by attaching a counter in the driving pulley that will record, not the number of times that the pulley revolves, but the amount of unbalanced force that the pulley has been subjected to at every turn. In the meter, the intensity of this driving strain governs the amount that the counter shall count at every revolution of the shaft, which must show like the meter for gas or water, where power is going to waste, or more is bought and paid for than has ever been used.—*Boston Jour. of Commerce*.

A CYLINDRICAL STEEL CAR.—The question of substituting iron for wood in car construction is constantly coming more and more to the front. So far only a few express and mail cars have been constructed of iron; but a company has recently been organized in Chicago for building steel cars, which bids fair to become a success. Such cars will be much stronger than wood, quite free from doubling up or splintering in a collision, and absolutely fireproof. They should come into general use.

THE RANGE and penetrating power of modern rifled guns is tremendous. The 10-inch rifle which the Miantonomah now carries at the Navy-Yard will pierce 21 inches of iron at a distance of 1000 yards. The 6-inch American rifle will drive its projectile through 10½ inches of wrought iron at 1000 yards. The 8-inch rifle will pierce 16.3 inches of iron at the same distance. The 12-inch rifle will penetrate 28 inches of iron at the same distance.

GOLD is very scintillating—that is, it can be cut and shaved with a knife, like a piece of wood or horn, while pyrites and other worthless minerals will crumble under the knife-blade like a lump of sugar.

SCIENTIFIC PROGRESS.

ORIGIN AND CAUSE OF THE GULF STREAM.—W. S. Howard, who was for three years on the United States Coast Survey steamer Blake, says that for two years the gulf stream was observed and traced, and it was definitely ascertained to originate at a place between Fowey Rocks, a ledge in the Atlantic, off the south extremity of Florida, and Gun Key, on the Bahama coast. The steamer was anchored at this point, and the study of the gulf stream was begun there. The stream was found to vary daily in velocity, the difference being equal to 2½ knots per hour. The current was affected by the moon, and the greatest strength of the current was a day or two after the declination of the moon. The steamer anchored at 26 stations to observe the gulf stream, and upward of 1500 observations were taken. With other apparatus two meters were used at once by which the velocity of the surface and the subsurface was simultaneously noted. The surface current runs with much greater velocity than the sub-surface. The true axis or beginning of the stream is 11½ miles east of Fowey Rocks Light-house. Here the strongest surface current found was 5½ knots per hour, and the weakest 3½, an average of 3.6 knots. At the axis there is a depth of 498 fathoms of water. The soundings brought to light no explanation of the mysterious origin of the stream. The deductions from the observations are that the trade winds and Mississippi river may both be dismissed as probable creators of the current, and that the velocity of the current is positively controlled by the declination of the moon.

THEORIES AT FAULT AS TO COAL COMPOSITION AND ACTION.—It is now asserted that the attempt that has been made by certain German chemists of prominence to connect the physical phenomenon of coking with the chemical composition of bituminous coal—especially with reference to the richness of the coal in what is called disposable hydrogen, or that proportion of it which is in excess of the quantity required to form water with the oxygen present—does not correspond with observed results, nor, again, does the richness of a sample of coke in carbon determine its coking qualities, the fact being that two specimens of coal, of practically identical carbon composition, are often found to behave very differently in the retorts of coke ovens. It is therefore argued that, if the property of coking does not reside either in the surplus hydrogen or the fixed carbon, it is certainly not to be found in the contents of the coal in oxygen, which gives no indication whatever of the physical behavior of the coal under heat. Some coking coals coke without much swelling, while others swell considerably in the process; in either case, the coal must undergo a stage of fusion, in which it becomes a thick, semi-fluid mass, through which the gas escapes; but why one kind of coal should swell considerably, while another variety of similar composition does not, is admitted to be a problem not apparently capable of solution from any of the chemical data usually preserved in analyses of coals.

THE RESEARCHES OF EMINENT BACTERIOLOGISTS and the discussions lately held regarding the causation and prevention of tuberculosis and other diseases have invested with profound interest the question of the relations of the diseases of lower animals to those of man. At the International Congress of Hygiene and Demography, to be held in London next August, a section will devote special attention to the infectious, contagious, parasitic and other diseases communicable from animals to man, and vice versa; the methods of the propagation of diseases affecting mankind by means of animals and animal products; the infection of meat, milk and other comestibles, and the restrictions to be placed on the sale of infected food and the movement of infected animals. A number of the high authorities in the medical, veterinary and agricultural world are expected to participate and throw light on investigations that are of great importance to the welfare of mankind.

FURTHER PROOF.—It has long been held that the diamond is identical with pure carbon. Further proof of this has recently been advanced by some experiments on the diamond by Mr. A. Krane, who burnt some splinters in a current of oxygen, the products of combustion being absorbed by ammonia, and the ammoniacal solution decomposed with pure sodium hydroxide. A comparison of the crystals obtained on evaporation with those of pure sodium carbonate showed that they had the same percentage of water of crystallization, and that they were identical in crystalline form, optical properties, melting point, electrical conductivity, and solubility in water. According to the *Journal of the Chemical Society*, the author concludes that the diamond must be chemically identical with carbon, since not only is the atomic weight the same, but on oxidation they both yield exactly the same product.

PAMBUANO, A SUBSTITUTE FOR QUININE.—Dujardin-Beaumetz has, according to the *Medical Press and Circular*, recently called attention to the antiperiodic properties of an extract obtained from the root of a shrub called pambuto. The aqueous decoction of the root has been largely and successfully used in

the treatment of malarial fevers; it has been beneficial in a number of cases in which the symptoms did not yield to quinine. The isolation of an alkaloid has not hitherto been effected, but the plant contains various fatty bodies and essential oils in addition to a special kind of tannin. All the active properties of the root are extracted by maceration in alcohol at 60°. The writer in the *Press and Circular* adds that, while the high value of quinine as a febrifuge and antiperiodic is incontestable, the faults and failures of the old favorite declare themselves from time to time, and hence the discovery of other vegetable products which have similar powers is not without importance, since some of these may and do succeed when quinine has proved ineffectual.

FROST-RESISTING POWER OF STONES.—Experiments on the frost-resisting power of natural and artificial building stones have been made by Mr. Sanechinger, as stated in the *Journal of the Society of Chemical Industry*, with 21 different kinds of natural building stones, three to six test pieces of each being used. Their tensile strength, dry and wet, their capacity for absorbing water, their alteration in volume, tensile strength and behavior toward water after freezing and thawing 25 times, and their specific gravity, were determined. Out of this number of samples, ranging from limestone to sandstone, only six were found to resist repeated freezing, viz., one of dolomite, one of diorite and four sandstones. Four other samples were found to resist freezing fairly, but not absolutely; but of 41 samples of artificial stones similarly tested, only three were found thoroughly unaffected, while eight proved fairly resistant.

THE TOXIC PRINCIPLE OF INSECT POWDER.—The active principle of pyrethrum flowers is said to be an acid (pyrethrotic acid) soluble in alcohol, amyl alcohol, ether, and chloroform, which may be isolated by means of ether, after having been converted into an alkaline salt and decomposed by tartaric acid in aqueous solution. When this acid was hypodermically injected into animals, it was observed that the poison produced its effects in two distinct stages. In the first there was an excitement more or less pronounced, proportional to the quantity administered; in the second there was a complete prostration, accompanied always by paralysis of the lower extremities, which might disappear after a time, or be the precursor of a fatal issue, the respiration and circulation being effected only in the latter case.

ANOTHER PHOTOGRAPHIC DISCOVERY.—According to the Vienna correspondent of the *Daily Chronicle*, an interesting discovery in photography is said to have been made by Herr Dombrzynski, of the Lamberg Polytechnic Academy, who claims to have succeeded in photographing by electro-magnetism. In a report on his discovery, addressed to the Vienna Academy of Science, Herr Dombrzynski explained the means by which he succeeded in obtaining photographic effects by electro-magnetic undulations.

AN ALLOY, the electrical resistance of which diminishes with increase of temperature, has recently been discovered by Edward Weston. It is composed of copper, manganese and nickel. Another alloy, due to the same investigator, the resistance of which is practically independent of the temperature, consists of 70 parts of copper combined with 30 of ferro-manganese.

SPEED OF SHOT AND METEORS.—The singular fact is demonstrated that, while the most rapid cannon shots scarcely attain a velocity of 600 meters a second—over 1500 miles per hour—meteorites are known to penetrate the air with a velocity of 40,000 or even 60,000 meters per second, a velocity which raises the air at once to a temperature of from 4000 to 6000 degrees C.

LATENT HEAT.—The phenomenon of latent heat was first inquired into by Dr. Black, of Scotland, nearly 130 years ago. His attention was directed to the subject by observing that a mixture of ice and water, though absorbing a measurable amount of heat, did not rise in temperature until all the ice had disappeared.

A STRETCHED PLATINUM WIRE, when heated to incandescence and traversed by an intermittent current of electricity, vibrates and becomes subdivided in a series of waves, having well-marked neutral segments and nodes.

BACTERIA AND PHOSPHORESCENCE.—A French savant has discovered that the phosphorescence in crustacea is owing to the presence of bacteria in the muscle—in other words, disease.

THE MOON.—Prof. E. S. Holden, of the Lick Observatory, has a paper on "The Moon" in the February double number of the *Youth's Companion*.

BEEES AND WASPS.—About 4500 species of wild bees are known, of wasps 1100, of which 170 and 16 respectively live in Great Britain.

In the six-inch rifled gun the projectile is making 250 revolutions per second at the moment of leaving the muzzle.

USEFUL INFORMATION.

The World's Money.

Mr. Leech, the Director of the Mint, has prepared for the House Committee on Coinage a series of interesting tables showing the gold and silver estimated, and officially reported to be in circulation as money throughout the world, and the specie holdings of the leading European banks. The most comprehensive table is the following:

APPROXIMATE AMOUNT OF GOLD AND SILVER MONEY IN THE WORLD.

Country.	Gold.	Silver.
United States.....	\$492,018,863	\$482,671,346
United Kingdom.....	550,000,000	1,000,000,000
France.....	100,000,000	700,000,000
Germany.....	600,000,000	145,000,000
Belgium.....	65,000,000	55,000,000
Italy.....	140,000,000	60,000,000
Switzerland.....	15,000,000	15,000,000
Greece.....	2,000,000	4,000,000
Spain.....	100,000,000	125,000,000
Portugal.....	40,000,000	10,000,000
Austria-Hungary.....	40,000,000	90,000,000
Netherlands.....	25,000,000	65,000,000
Scandinavian Union.....	82,000,000	10,000,000
Russia.....	100,000,000	60,000,000
Turkey.....	50,000,000	45,000,000
Australia.....	100,000,000	7,000,000
Egypt.....	100,000,000	15,000,000
Mexico.....	5,000,000	50,000,000
Central America.....	5,000,000	500,000
South America.....	45,000,000	25,000,000
Japan.....	90,000,000	50,000,000
India.....	900,000,000	70,000,000
China.....	700,000,000	100,000,000
The Straits.....	100,000,000	5,000,000
Canada.....	10,000,000	2,000,000
Cuba, Hayti, etc.....	20,000,000	2,000,000
Totals.....	\$3,727,018,863	\$3,820,671,346

The silver money is classified by Director Leech, in the following table, into that which is full legal tender and that which is tender for but limited amounts:

	Full legal tender.	Limited tender.
United Kingdom.....	\$100,000,000	\$100,000,000
France.....	\$650,000,000	50,000,000
Germany.....	102,000,000	43,000,000
Belgium.....	49,400,000	6,000,000
Italy.....	25,800,000	34,200,000
Switzerland.....	11,400,000	1,600,000
Greece.....	1,800,000	2,200,000
Spain.....	90,000,000	35,000,000
Portugal.....	40,000,000	10,000,000
Austria-Hungary.....	90,000,000	10,000,000
Netherlands.....	61,800,000	3,200,000
Scandinavian Union.....	10,000,000	10,000,000
Russia.....	22,000,000	38,000,000
Turkey.....	45,000,000	15,000,000
Australia.....	7,000,000	7,000,000
Egypt.....	50,000,000	50,000,000
Mexico.....	500,000	500,000
Central America.....	500,000	500,000
South America.....	25,000,000	25,000,000
Japan.....	50,000,000	50,000,000
India.....	1,000,000,000	1,000,000,000
China.....	700,000,000	700,000,000
The Straits.....	100,000,000	100,000,000
Canada.....	1,200,000	5,000,000
Cuba, Hayti, etc.....	1,200,000	5,000,000
Totals.....	\$3,929,900,000	\$408,000,000

The total stock of full legal tender silver coin in Europe is given at \$1,101,400,000.

THE UTILIZATION OF PINE LEAVES for the manufacture of bagging, matting, etc., has become an industry of recognized importance, and in North Carolina a company has for some time been in operation for thus producing matting and bagging, with a daily capacity of 2000 yards, the material being in every respect equal to jute, as well as cheaper. The process appears to be a simple one. The leaves of the long-leaf pine are gathered in a mass, and, on being weighed, are thrown into a large vat, whereby they are boiled in alkali at a low temperature for about 12 hours; then, after being thoroughly soaked in the same vats, they are taken by a continuous automatic process through the rubbing, wringing, carding, drying, re-carding, drawing, roving, winding and weighing machines, in the latter of which the substance becomes an excellent article of bagging, and, after going through a calendering apparatus, is ready for use and the market. After leaving the wringer, the process of manufacture is very nearly identical with that of cotton goods. As a material for upholstering purposes and for carpet lining, it is found well adapted. It appears that for every foot of pine timber there is one pound of green leaves; nor is the tree at all injured by this treatment. Though capable of being worked up successfully into the other fabrics above named, the principal use of the leaves thus far has been for the manufacture of bagging.—*American Economist.*

TO PREVENT the paint on iron or wood from scaling off when exposed to the weather, first thoroughly wash the parts to be painted and then brush over the surface with hot linseed oil. By following this method, especially with iron articles, no scaling of the paint will occur. In cases where the articles to be painted are small and can be readily heated, it is better to heat them and plunge them into the oil. The thin liquid oil when hot enters into the pores of the metal, absorbs the moisture, and the paint then applied so firmly adheres that frost, rain or air cannot effect a separation.—*Phila. Record.*

"AFRICAN BASS" is the name given to a fiber obtained in the colony of Lagos from the bamboo palm. In appearance it is stiff and wiry, varying in color from dark brown to light red, and dependent for its shades on duration of soaking. It is most readily obtained in lengths of from three to four feet, beyond which length it is inconvenient to pack

and difficult to procure without injury to the tree. In diameter it varies from one sixteenth to one-thirtieth of an inch, the latter of which may be accepted as the limit of fineness to be admitted in a commercial sample for the European market. It is said to be used mainly in the manufacture of hard brushes for various domestic and manufacturing purposes. The demand appears to be very large, and the price is exceedingly satisfactory. The source of its supply in Lagos alone may be said to be practically inexhaustible.

HOW TO DECIDE THE "ALL-WOOL" QUESTION.—A fire test for wool is recommended by the *Lancet*. After separating the warp from the wool, hold each to a flame. No threads can be traced in the ash of wool, which burns to a shapeless mass or coarsens to blazes if removed from the fire before combustion is complete. Cotton, however, continues to burn steadily, and the shape of the thread is retained in the ash. Try it.

TYPE-SETTING MACHINES.—It is estimated that \$10,000,000 has been spent in the last 20 years on inventions for new type-setting machines, and the prediction is made by many that it is now only a question of a short time when, for ordinary and straightforward work, the machines will be in general use.

ENGLAND'S BEEF SUPPLY.—England is more dependent every year on imports of beef from the United States. More than three-fifths of the 500,000 cattle imported annually come from this country, the remainder from Canada.

ELECTRICITY.

AN ELECTRIC-POWER HAMMER has been devised which represents a radically new application of electro-magnetic principles. In general design the hammer is quite similar to the steam hammer, with its vertical cylinder mounted upon an arched frame, and the rising and falling piston by which the hammer-head is carried. The novelty of the apparatus lies in the substitution of electro-magnetic power for steam by a slight and very simple modification of the mechanism. The piston is of magnetic material, and the cylinder is composed of a series of coils through each of which an electric current may be passed separately. The apparatus is virtually an immense electro-magnet, the cylinder being the coil and the piston answering to the core. The passage of an electric current through the coils forming the upper part of the cylinder, raises the piston into the magnetic field thus created. By cutting off the current and simultaneously transferring it to the lower coils of the cylinder, the piston is released and its descent is accelerated by the magnetic attraction created below. As a magnetic field can be created in any of the series of coils, the blow may readily be shortened or lengthened as desired. The current is controlled by levers and connections identical with those used on an ordinary steam hammer. The absence of the steam pipe is the only feature distinguishing the machine from the common steam hammer.

ELECTRICAL ENGINEERING.—The inducements offered by the profession of electrical engineering are drawing each year an increasing number of young men into technical study of the subject. Electrical industry has two widely different phases, practical and technical. Fifteen years ago so little was known of the practical application of electricity that a quick, inventive mind, with no more technical training than might be gained by the experience of a telegraph office, could strike out in new lines of progress with every prospect of success. To-day good work cannot be done without studying and profiting by the results of that 15 years of marvelous development. He who starts to-day with the training that would have meant success then, will probably meet dismal failure now. Therefore, in taking up the study of electrical engineering, the more careful and thorough work you do, the better the chance in the future. Do not be deluded into the idea that you should "learn practical electricity in the workshop." You can learn more that will be of service to you by a year's careful work in a good laboratory than in five years in an electrical manufactory. Do not expect to leave the laboratory with an intimate knowledge of any electrical system; you will not have it, but you will have acquired what is of vastly greater value, that firm grasp of the general principles that will enable you to seize the details of any system with a rapidity that will surprise you.

THE ELECTRICAL TOOTH DRAWER.—The electrical instrument invented for avoiding the pain incident to the extraction of teeth consists of adjustable prongs, carrying buttons and connected with an electrical battery. The buttons are placed on the face, over the nerves leading from the teeth to the brain, and a circuit is established the moment the extracting instrument touches the tooth.

WELDING SHEETS BY ELECTRICITY.—C. L. Coffin of Detroit has patented a device for welding sheets by electricity. The two sheets of metal to be welded are placed on a suitable insulated table with the edges to be welded opposite each other, and are so clamped by means of two clamps, to each of which one pole of the dynamo or electric generator is connected. A cur-

rent thus passes through the plates and their opposite edges become heated. This heat is, however, intensified by a roller being rolled along these edges, which is also connected to one of the poles of the generator, so shunting part of the current. In order that the heat shall be still more intensified, the roller can be so constructed that it can be continually slightly withdrawn from the plates to be welded and then brought in contact again, thus forming a voltaic arc.

ENGINEERING NOTES.

Railroads in South America.

The Trans-Andine railway, which was undertaken a good many years ago, will probably be completed next year, forming the first railway across the continent of South America. Of the entire distance of 871 miles from Buenos Ayres on the Atlantic to Valparaiso on the Pacific Coast, only about 100 miles remain to be constructed, but this is the most formidable portion, crossing the Andes at an elevation of 13,000 feet above the level of the sea and involving heavy grades and long tunnels.

This road, through much of its course, passes over a very level and fertile country, and has what is probably the longest straight line of track in the world. Over this part of the track the locomotive runs, without a curve, 211 miles. Moreover, in this distance there is not a single bridge and no opening larger than an ordinary culvert, no cut greater than one meter in depth, and no fill of a height exceeding one meter. There is almost an entire absence of wood on the plain across which the western end of the road is located. This has led to the extensive use of metallic ties, which will be employed on nearly the entire road.

Railroad building in South America seems to have taken a new impetus during the last few years, which will no doubt be much increased by the deliberations of the Pan-American Congress.

NAVAL ENGINEERING.—G. Pinnlington, C. E., of Chester, England, says *Industry*, has been writing some interesting essays on the dynamics of ship propulsion, and has had the temerity to make his propositions understandable by people not skilled in complex formulae. It is often asked why the force required to part the water at a ship's bow is not given back by the rudder on or reflex at her stern. This, as Mr. Pinnlington explains, in simple terms, is because the ship is moving ahead. Supposing the resistance to movement to be equal to a head of 16 feet, a velocity of 32 feet per second, then reflux action would not do any good when flowing ahead at this rate. From this it follows that the form of a ship's stern should be modified to suit her speed. Again *Industry* asks: If passenger ships progress from 10,000 to 20,000 horse power in four years, what will take place in the future? The City of Paris, City of New York, Tonleuc and Majestic range from 17,000 to 20,000 horse power and burn from 300 to 400 tons of coal a day, or about one ton per mile. One reflection in this matter is that if development go on at this rate it will plant more firmly than ever the steamship-building interest in Great Britain. There is no stopping place, it seems. The art is cumulative, and the start gained there gives the industry an enormous advantage. Some one has been dividing the tons and horse-power of war vessels into their cost, and finds that in England it is \$150 per ton and the same per horse-power. In France it is \$232 per ton and \$280 per horse-power. In Russia the cost per ton is \$436, and in this country \$335 per horse-power.

THE PENNINGTON AIR-SHIP.—After some careful calculations on the Pennington air ship, from the figures given as to its size, weight, etc., the *Engineering and Mining Journal* comes to the conclusion that its promoters have evolved some new laws, logic and processes of which the engineering world is ignorant, or else they are destined to have their hopes of aerial navigation shattered as ignominiously as did their illustrious predecessor, Darius Green, and throws out a mild hint that the whole thing is a gigantic hoax, palmed off on a glib and unsceptible public by some over-zealous newspaper reporter. As the new comet in the firmament of science has not yet been discovered by the anxious and watchful astronomers at St. Louis, Chicago or New York, and since according to calculations it should have come into view, we are inclined to believe in the hoax theory.—*Ec.*

SHIP RAILWAY AROUND THE DALLES.—The U. S. Senate, it seems, has passed a bill appropriating \$2,800,000 to build a "ship railway" around The Dalles, on the Columbia River. In the House, Mr. Hermann thought \$2,000,000 would do. *Industry* thinks that the Government is hardly prepared to go into ship railways just yet. When a few have been made successful by private enterprise, it will be soon enough for the Government to make an attempt of the kind; besides, they had better finish the canal and sluices at the Cascades, and dredge out the estuary of the Columbia river before beginning at The Dalles.

MOVEMENT FOR A CANAL AT NIAGARA FALLS. In the House on Jan. 22d a joint resolution was offered memorializing Congress in favor of

the construction of a canal in New York at Niagara Falls, the passage of the Payne bill for that purpose being urged in the interest of commercial and agricultural interests West, and the military and industrial interests of the whole country.

GOOD HEALTH.

POISON IN HAT BANDS.—Enameled bat-bands should not be worn during the hot summer months. "A good many sore faces," said a well-known physician to a New York *Sun* reporter, "are caused every summer by poisonous sweat-bands in hats. Some men always insist on buying Derby hats with enameled sweat-bands, and if they wear them during the summer months a mild sort of blood poisoning is apt to result. As a man's head always perspires very freely under the sweat-band of his hat, the poison in the enameling composition is softened and released, but its unpleasant effects are seldom noticeable there. The very fact that the perspiration is constantly coming out of those particular pores prevents the poison from going in. But as each little bead of perspiration rolls down his face, it is charged with the poison, and if it happens to run over a little pimple, or a place where he has scratched his face, or cut it with a razor, the result will probably be unpleasant. A dozen tiny pimples will appear, and no matter how many 'blood-purifiers' he does himself with, his face will be dotted with little sores until he buys a hat with a good sweat-band. Straw hats are seldom made up with the enameled sweat-bands, and that fact is another reason why every man should wear them in the summer. Of course this warning does not apply to all hats with enameled sweat-bands. Some of them are perfectly harmless, but as it is impossible to tell which are good and which are bad without a chemical analysis, and as a chemical analysis would spoil the hat, enameled sweat-bands are good things to avoid in hot weather."

THE CURE OF LOCKJAW.—Not long ago a German physician seeking light on that terrible disease, lockjaw, found that inoculations with the blood and other fluids of the body of a victim failed to produce this malady; but when fluids were used which had been squeezed from the wound, or scraped from its immediate vicinity, which had caused lockjaw, then the disease was invariably produced. This, of course, would indicate that the direct cause—the specific poison of lockjaw—remains near its point of entrance, and that local treatment is imperative. Dr. Pavillon accepts this theory, and recommends subcutaneous injections of carbolic acid in the treatment of the disease. He cites the case of a boy, 15 years old, who was attacked with lockjaw in a severe form after being wounded on the foot. The usual remedies were at first applied without any effect. On the fourth day a one-per-cent solution of carbolic acid was injected near the seat of the injury. Similar injections were repeated every three hours during the first four days. Improvement began on the second day. Recovery finally took place. The injections, gradually decreased in frequency, were kept up until the twenty-seventh day. Another case of recovery under the same treatment has been reported.

TOOTH-PULLING IN CHINA.—The report of the physician in charge of the Ningpo Missionary Hospital for the past year contains, observes the London *Times*, some interesting observations on tooth-drawing in China. Dr. Daly remarks that Chinese teeth are much more easily extracted than those of Europeans. The native dentists are said to possess a wonderful powder, which is rubbed on the gum over the affected tooth; after an interval of about five minutes, the patient is told to sneeze, whereupon the tooth falls out. Dr. Daly has offered \$100 to any one performing the operation in this way in his presence, on condition that he allowed to choose the tooth and examine the mouth before and afterward. So far, no one will consent to perform the operation on these conditions.

DISBELIEVERS IN VACCINATION for smallpox should consider the statements just made to the French Academy of Medicine by Dr. Brouardel. While Germany loses only 110 persons per annum from smallpox, France actually loses 14,000, to be accounted for by the right way in which vaccination is enforced in Germany and by the carelessness of the Frenchmen. In 1865, when vaccination was not obligatory in Prussia, the mortality was 27 per 100,000 inhabitants. After vaccination was enforced, the mortality fell in 1874 to 3.60 per 100,000 and in 1886 to 0.049. At the present time, the mortality from this cause in France is 43 per 100,000.

HOW TO TAKE CARE OF THE BRAIN.—The brain stands the most abuse of any organ in the body. Its best tonic and stimulant is success. The worst and most depressing thing to it is failure. The most injurious effects come by using stimulants in early life. Young people should never use liquors, tea or coffee. The latter two may not exactly do harm, but they are conducive of no good. They act mostly on the brain and injure its growth very materially. Abundance of sleep is necessary. Eight hours is not more than enough. Sleep is the time of relatively lowered expenditure and increased repair.

SAN FRANCISCO:

Saturday, February 21, 1891.

TABLE OF CONTENTS.

EDITORIALS.—The Yosemite National Park, 118; Passing Events; Mining and the World's Fair; Diamond Drill Prospecting; Proxies in Mining Elections; Gold Mining in Victoria, 120 "Faults" in the Great Basin; An Improved Fuse-Cap Fastener, 121.

ILLUSTRATIONS.—The Yosemite National Park, 118; Trough Produced by Faulting, near Mouth of Little Cottonwood Canyon, Utah; Moody's Fuse Cap Fastener, 121.

CORRESPONDENCE.—Mines Around Angels, 114.

MISCELLANEOUS.—What is an Anti-Cyclone; Gold Placers of Nevada; The Emma Mine; The Nicaragua Canal; Process for Refractory Ores; California Insects, 114; Amalgamation at the Comstock Lode; Reworking Old Cinder Piles, 115.

MECHANICAL PROGRESS.—Abrasive Cutting; The Cold Saw Method; A Wonderful Alloy; A New Dynamite Gun; Aluminium Steel Armor Plates; Improved Jointing of Iron Surfaces; Water Meters and Power Motors; A Cylindrical Steel Car; Miscellaneous, 118.

SCIENTIFIC PROGRESS.—Origin and Cause of the Gulf Stream; Theories of Faults as to Coal Composition and Action; The Researches of Eminent Bacteriologists; Further Frogs; Pambuto, a Substitute for Quinine; Frost-Resisting Power of Stones; The Toxic Principles of Insect Powder; Another Photographic Discovery; Miscellaneous, 118.

USEFUL INFORMATION.—The World's Money; The Utilization of Pine Leaves; African Bases; How to Decide the All-Wool Question; Type Setting Machines; England's Best Supply, 119.

ELECTRICITY.—An Electric Power Hammer; Electrical Engineering; The Electrical Tooth Drawer; Welding Sheets by Electricity, 119.

ENGINEERING NOTES.—Railroads in South America; Naval Engineering; The Pennington Air-Ship; Ship Railway Around The Dalles; Movement for a Canal at Niagara Falls, 119.

GOOD HEALTH.—Poison in Hat Bands; The Cure of Lockjaw; Tooth-Pulling in China; Disbelievers in Vaccination; How to Take Care of the Brain, 119.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 116-117.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 124.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 124.

Passing Events.

The Committee of the House of Representatives that has in charge the Senate Free-Coinage bill vote on the bill on Friday, and will probably report it back some day next week, but whether in time for passage, if it be amended, at this session of Congress, is a disputed question.

There is quite a material "drop" in the prices of both coal and iron this week. Coal has been held pretty high for some months and the reduction of \$2 a ton is quite important for manufacturing interests. It is thought there will still be further reductions in both these important staples.

The mining men won another victory this week in the Assembly when they passed a bill providing that suits brought by any of the valley counties against miners or mining corporations shall not be tried in the county by which the suit is brought. The vote was 50 to 10.

The country is called upon to mourn the loss of two more of its prominent men, General Sherman and Admiral Porter, both of great prominence in the Civil War and identified with the history of the country.

The Young America South Mining Company of Tuscarora, Nev., has discontinued and re-incorporated as the Optima Mining Company, under which name it will henceforward be "called" at the San Francisco Stock Board.

Mining and the World's Fair.

It is hardly probable that any of the Pacific Coast States or Territories will be honored or recognized by the selection of one of their residents for the chief of the mining division at the coming World's Fair at Chicago. Mining, in the eyes of most Eastern people, means something connected with coal and iron, and the gold, silver, copper and lead mining interests are of secondary consideration. This being the case, it is a foregone conclusion that an Eastern man will be chosen head of that department and most of his assistants will come from the Pennsylvania coal and iron regions. Very likely some New York man will be selected as chief for presumed executive abilities and some slight connection with the mining interests. It is the way these things usually are done and we can scarcely expect anything different this time.

The representatives from the Pacific Coast will scarcely be able to overcome the prejudices in the direction named, but they should concentrate their energies in insisting that each of the Pacific mining States and Territories shall have proper representation in the mining division, so that, aside from the general committees, there will be at least one man from each section whose business it is to see that the mining interests of his region have proper recognition and representation. If this course is not pursued, the precious-metal interests will be entirely overshadowed by those of coal and iron.

As many of these offices are salaried, they will be in great demand, and there is natural fear that they will be filled by the class of people who generally run after such things instead of by men fitted by experience and knowledge to do some good to the interests in question.

The coal and iron interests of the country are of great magnitude and in a position where there is no chance of their being ignored; but those of the precious metals and minor minerals are apt to be set too far in the background unless those identified with them take precautions and care.

It is greatly to be hoped that there will be no political preference in the selection of a chief of the department of mines and no desire to put some one in from a certain State simply because he is from that State. It needs a man of good executive ability and who is familiar with the whole mining industry of the country, not a single section alone. Some one should be chosen who has visited the various mining centers of the United States, has knowledge of the different conditions, and can give due recognition to each.

Probably no man in the United States has had better opportunities for observation of the mining industry in general than Dr. David T. Day, Chief of the Division of Mining Statistics and Technology of the U. S. Geological Survey. His annual report entitled "Mineral Resources of the United States," embracing all mineral substances except gold and silver, is one of the most useful and practical works issued by the Government. In its preparation he has many assistants skilled in the various branches whose work he supervises, and he also, in the course of this work, has visited all the important mining centers in the United States, both in the East and West. Dr. Day is an enthusiast in his work, young, energetic and active, and would be just the man to act as Chief of the Mining Division of the World's Fair. He is at the head of the mineral division of the 11th census, and has managed the immense business of that work with marked ability. If a man like this could be chosen, there would be no cause of complaint from any section, since his experience is such that he has appreciation of all the varied interests of the whole country and would not take a narrow view of the subject in any particular. Some such man as this ought to have the place. Then the Pacific Coast States would receive due recognition, and those in the subordinate positions would be men with some knowledge of the mining industry.

It will be remembered that not very long since the Walnut Grove storage-reservoir dam broke in Arizona, and 14 lives were lost. The heirs of the dead persons whose property was swept away by the flood brought suit against the water company, and the suit has just been decided in favor of the company.

Diamond Drill Prospecting.

In the colony of Victoria there are 15 diamond drills, the property of the Government, and worked at Government expense, employed in different parts of the mining regions. Five of these drills are used for prospecting for coal and the other ten are engaged in prospecting for gold at Clunes, Ballarat, Common, Warranheep, Coghills Creek, Lauriston, Lilliecur and Windermere for alluvial and at Woods Point, Stawell and Sandhurst for quartz. The total number of feet bored during the last three months for gold is 6329, for coal 3700, amounting in the aggregate to 10,029 feet. In addition to the number of feet bored by diamond drills, 1112 feet were bored in search of gold with Tiffin and hand-augers on contract.

As to the results of the diamond-drill work, at Clunes, the last bore is proving the deepening of the ground to the eastward. At Ballarat, it has proved ground sufficiently deep to show that there must be in the vicinity a deep lead the true position of which will be found before the drill is removed. At Lansell, no reef has been found, but warm water, showing existence of some lode or fissure at great depth. Experiment is being made to ascertain if the water contains gold or other metals or minerals in solution. At Coghills creek the last bore shows deepening ground to the eastward, in which direction boring will be continued to ascertain if the main lead exists in that direction.

At Lauriston the last bores proved satisfactory. The northern extension of the lead proved in a former series at Boggy Creek Boring is now in progress to prove the extension of two leads toward a junction with another. At Lilliecur the position of deep ground with wash has been satisfactorily proved. At Windermere the deep ground has been proved, with wash; boring will be continued to see if this is the deepest ground in the locality.

In the coal prospecting, three seams of coal were struck at Korumhnra and an immense bed of lignite was found at Morwell.

The Government also paid subsidies during the last quarter to the amount of £16,475 to mining companies, prospecting associations and co-operative parties who were prospecting ground where good would be done to others in case of finds.

It will be seen by these statements that the colony of Victoria greatly encourages its mining industry. Very complete and useful reports of operations are published. Roads are built, investigations are made, prospecting is done in new regions and all possible public aids to miners given. The mining industry is aided out of the public funds. They even encourage hydraulic mining which we have stopped here.

Proxies in Mining Elections.

The Act to regulate the giving of proxies, introduced by Assemblyman Bert, has been favorably reported by the Committee on Municipal Corporations and passed the second reading. It is intended to do away with the evils attending the present proxy system in mining company elections.

The proposed law provides that all elections must be by ballot, and every stockholder shall have the right to vote in person or by proxy the number of shares owned by him. The proxy must be in writing, duly executed and acknowledged by the bona fide owner of the stock at the time of such election, whether the same shall, at the time of said election, stand on the books of the corporation in his name or the name of some other person. Said bona fide stockholders may vote for each director or cumulate the shares and give one candidate as many votes as the number of directors.

Every person acting at an election in person or by proxy must be a member thereof, or a bona fide stockholder, at the time of the election, and must make affidavit to this fact before the chairman of the meeting, who is authorized to administer such oath, and no proxy shall be valid at any election unless it be the proxy of a bona fide owner of capital stock at the time of such election, and said proxy must contain the number of shares and the number of the certificate represented therein, and must be executed before a notary public or other officer authorized to administer an oath, by the owner of said stock, who shall make affidavit

that he is such owner of said shares. Brokers or persons holding stock as security, or officers of corporations or other persons in whose name stock is issued for business conveniences or otherwise, are not bona fide owners in the sense in which the words are used in this section. And brokers, or persons, or others so holding such shares or certificates of stock in their possession or security, or otherwise, must give to the owner of said shares of stock the numbers of said certificate or certificates upon demand of said owners. Any vote or election had other than in accordance with the provisions of this article, is voidable at the instance of any stockholder or member and may be set aside by petition to the Superior Court of the county where the same was held.

Every person voting stock, or in any way violating the provisions of these sections, or any person making, or procuring to be made, any false entry in the books of such corporations, contrary to the provisions of this section, shall be punished by a fine of not less than \$1000, or more than \$2000, and by imprisonment in the county jail for one year, or by both fine and imprisonment.

If this Act becomes a law, the brokers cannot use or lend the stock in their hands for proxy purposes at elections. Only bona fide owners can vote, and people owning no stock cannot use the stock of others. This same measure brought opposition at previous sessions of the Legislature, but the brokers now realize that the people who have been using the stocks of others in elections have not done any good to the stock business, but have rather created loss of confidence. The measure will apply to all corporations.

Gold Mining in Victoria.

The yield of gold in the colony of Victoria for the last quarter was 141,251 ounces, and showed an increase from quartz and a decrease from alluvial washings. The quantity of quartz crushed in the various mining districts during the past quarter was 196,119 tons, which yielded 89,545 ounces of gold, or an average of 9 dwt. 3 gr. Ballarat district crushed the greatest quantity, where 75,200 tons yielded 29,120 ounces. The highest average was in Gippsland district, where 818 tons gave a return of 6119 ounces of 15 dwt. 1 gr. per ton. There were also 6388 tons of quartz tailings treated, yielding 423 ounces, and 1406 tons of pyrites operated on for a return of 3558 ounces. The waste dust reported as having been sluiced during the quarter was 194,369 tons, which yielded 15,546 ounces of gold, an average of 1 dwt. 14 gr. per ton. There were also 5056 tons of cement crushed, yielding 576 ounces of 2 dwt. 6 gr. per ton.

There were 24,196 gold miners employed throughout Victoria during the past quarter, which was 393 more than the number at work the previous quarter. In quartz mining, 12,396 men were engaged, and 11,800 in alluvial—the number of Europeans being 20,893 and 3303 Chinese. Compared with last quarter's (June) returns, there was an increase of 418 in the former class and a decrease of 25 in the latter. The following shows the number of miners employed in each district on the 30th September last: Ballarat, 6129; Sandhurst, 4333; Maryborough, 3836; Castlemaine, 3286; Beechworth, 3202; Gippsland, 1707; and Ararat, 1703. The average value of gold produced per miner was the highest in the Ballarat district, namely, £35 6s. 5d., while for the whole of the colony the average rate per miner employed amounted to £24 13s. 5d.

Although the yield of gold for the quarter is less than that for the previous quarter, still there is an increase of £2307 in the amount paid in dividends during the former period as compared with the latter. The total sum disbursed during the quarter amounted to £126,531 15s. 4d. Of the several districts, Sandhurst has the largest number of dividend-payers.

At the close of the quarter there were 918 steam engines employed in connection with quartz mining, having an aggregate horsepower of 20,659, while 199 were employed in alluvial mining, having an aggregate horsepower of 6347. For quartz crushing 5880 stamp-heads were employed, and 152 crushing cement. The value of the whole of the machinery used in gold mining throughout the colony was estimated at £1,841,442, being £1,569,786 for quartz and £271,656 for alluvial.

The machinery used in each district was valued as follows: Sandbarst, £501,131; quartz, £492,611; alluvial, £3570. Balfaret, £399,884; quartz, £293,086; alluvial, £106,798. Castlemaine, £231,613; quartz, £212,022; alluvial, £19,591. Beechworth, £210,512; quartz, £167,248; alluvial, £43,264. Maryborough, £206,154; quartz, £138,780; alluvial, £67,374. Gippsland, £153,401; quartz, £137,647; alluvial, £15,754. Ararat, £138,697; quartz, £128,392; alluvial, £10,305.

"Faults" in the Great Basin.

In the district of the Great Basin the characteristic geological structure of mountain ranges is one in which faults play an important part. Foldings of strata are not wanting, but the greater features of relief appear to have been wrought by the displacement of orographic blocks along lines of faults. Sometimes a mountain range consists of a great block of strata cut off along one side of a profound fault, and inclined in the opposite direction until it descends beneath the plain constituted by the alluvial deposits of the adjacent valley. More frequently there are other faults

The Yosemite National Park.

(Continued from page 115)

from spoliation and possible extinction? Then, in order more fully to realize how well Congress has deserved in reserving and preserving these unequalled scenic repositories from spoliation and vandalism, let me merely outline some of the principal features of the Yosemite National Park. Beyond question, it has more wildly sublime scenery, within the same area, than can be found in any other section of the Sierra Nevada mountains. I have crossed the great chain, personally, in over 20 different places, from Mt. Shasta to Mt. Whitney (both of which I have climbed) and spent months at a time in searching for scenic treasures among them, therefore, should know whereof I write. Prof. Wm. H. Brewer, first assistant of the State Geological Survey, under Prof. J. D. Whitney, has frequently enunciated similar convictions. No description, even when accompanied with illustrations, can do it even approximate justice. Its beautiful and sublime features must be seen to be feelingly appreciated; and even then, words would be impotent to fittingly define its multitudinous charms.

ered by private ownership, no revenue, to meet incidental expenses, would be possible from that source, as provided by the Acts passed. This should engage the attention of friends to the measure before Congress adjourns.

An Improved Fuse-Cap Fastener.

The device shown in the illustration, which has been patented by Mr. N. W. Moodey of Fresno, Fresno county, Cal., is especially designed as an improved implement for fastening the caps on fuse employed in exploding giant powder. The pliers are formed of two similar parts, connected by the pivotal rivet, each part

This implement is neatly gotten up of the finest cast steel and nickel plated. It is small and light but strong and well adapted for its purpose.

Uses and Value of Mica.

EDITORS PRESS:—I write to make inquiry in regard to isinglass, wishing to know its value per pound, if of value at all. In my claim I can get heavy blocks of it, from six inches square to two and three feet, and even more. I wish to sell either the product or the mine. Susanville, Lassen Co. B. P. PERGOV.

These same questions have been several times answered in the PRESS. Mica (of which a popular name is isinglass) is of little value on this coast, if any. We have made repeated inquiry and never found any one desirous of purchasing even the very best material. There is a great difference in the mineral, some of it being white and clear and in large sheets, and some being colored, stained or spotted, and being found in small pieces.

North Carolina produces 60 per cent of the mica yield of the United States. The other regions are in New Hampshire, New Mexico, Virginia and Dakota. Last year this country produced 48,000 pounds of sheet mica, worth \$70,000, a very considerable decrease from 70,500 pounds, worth \$142,250, the year before. The mica imported to the United States from India last year was worth \$57,541, the largest amount ever before imported.

These imports have gradually increased from an insignificant proportion until in 1889 they more than equaled the domestic product.

In 1883-84, the scarcity of large sheets of mica compelled stove-manufacturers to change their patterns and substitute smaller sizes. Large sheets are not so plentiful as small ones. As an instance of this change, it is stated that one stove-manufacturer who in 1884 bought \$30,000 worth of mica now only buys \$5000 worth a year. The increased use of furnaces instead of fire place heaters has also lessened the use of mica. Meanwhile a demand has sprung up for the mineral for use in the construction of dynamos. Strips of mica of various dimensions, but usually one inch wide and eight inches long, are made part of the insulating material in building up the armatures. But this new use has had little effect upon domestic mica. The imported mica has proved more satisfactory than the usual grade of domestic material.

The consumption of ground mica waste is increasing steadily, particularly as an addition to lubricants, and it is believed that this feature, which concerns about 90 per cent of the product of the mines, will add greatly to the stability of the industry. The best quality of waste is used for decorative purposes; the second quality is used without grinding for steam and water valve seats. The rest is sold for mixing with fertilizers. Some poor grades are used in making axle grease. The price of the waste is \$10 to \$15 per ton, according to quality. The former higher prices for mica do not now obtain, it running from \$1 to \$4 per pound, prepared for market.

The reason there is no market for it in California is that none of the class of manufacturers using it are represented here. The stove-makers buy the North Carolina material, which comes in commercial sizes, in boxes ready for use, and they use very few pounds a year. They prefer to buy it ready out in standard sizes rather than to buy sheets or blocks mined here and not prepared for use. There is plenty of very good mica in various parts of California, but no one has yet gone into the business of mining, splitting and cutting it ready for market. There is also a good deal which is inferior in quality and color. There is not at present any encouragement to mine the substance in this State, for there is no local market, and in the East the channels of trade are controlled by owners of mines which are developed and equipped to supply standard sizes in any quantity.

There are two firms in Richmond, Virginia, who grind the waste. Traylor & Hargrove grind 350 tons a year and the Richmond Lubricating Co. grind 200 tons. S. W. Blalock, Ledger postoffice, North Carolina, is an extensive dealer in mica. Eugene Munsell & Co. of New York use quantities in stove manufacture. These are the only persons in the business whose names we have been able to obtain. No one in this city, as far as we can learn, is purchasing the substance,

TROUGH PRODUCED BY FAULTING, NEAR MOUTH OF LITTLE COTTONWOOD CANYON, UTAH.

within the range trending parallel to its length and having thrown on the same side with the throw of the greater fault at the base. Lines of faulting may sometimes be traced upon the displacement of so recent date that the atmospheric ground by means of low cliffs or scarps due to the pheroid processes of sculpture have not yet restored the ordinary forms of topographic detail.

A prominent fault is continuously traced by its scarp past Dry Cottonwood, Little Cottonwood and Big Cottonwood creeks, all of which issue from the Wasatch range within a distance of ten miles. In the vicinity of the streams, and in the intervals between them, the surface disturbances are complicated, and for a distance of about five miles there run opposing scarps, between which a block has been depressed. The depressed block, traversing the lateral moraines, has carried down segments of these, leaving the distal portions as a pair of outlying hills.

The northern lateral moraine of Little Cottonwood, being broad and flat, exhibits a conspicuous trench where crossed by the depressed block, as shown in the engraving herewith. The walls of this trench are among the freshest of the fault scarps, being bare of vegetation along their upper courses, and in places too steep to be climbed. On the side nearest the mountain their height is from 40 to 60 feet. Here again it is evident that the total displacement was accomplished by a series of efforts, for between the two moraines the phenomena of the depressed block appear in the alluvial plain of Little Cottonwood creek, and the greatest scarp on the plain has a height of only 20 feet.

As well "attempt to measure a rainbow with a two-foot rule," as to try to paint any of its majestic and storm-defying organs and peaks; its mountain-crowned domes and rook-ribbed canyons; its isolated spires or jutting needles; its cloud-draped beds of eternal snow; its ancient moraines and living glaciers; its thousands-of-years-ago glacier-polished floors and ridges; its multiform and placid tree-margined lakes; its vast stretches of primeval forests; its granite solitudes dotted with grassy and flower-carpeted meadows; and all of these in storm or in sunshine, in winter as well as in summer, then could we feel but never describe them.

One of the many charms of this magnificent domain is that while feasting both eye and mind, one inhales the pine-laden breath of its fragrant atmosphere, and drinks hearty draughts of its life-giving ozone, so that experience teaches him that, apparently, he has at last found the real fountain of perpetual youth and the elixir of life; while the spirit becomes as buoyant and as free as the eagle he sees circling so unheeding and so defiantly among the beetling cliffs above and around him. If those who feel that life's lamp is burning low would forego the crowded city and seek these health-restoring retreats, they would find that a new supply of the oil of life could here be found, and a new lease of health and renewed strength would be made out to them, and possibly add to their years of enjoyment and of usefulness.

As all bona fide entries are excluded from the provisions of each Act creating these National Parks, and as nearly every hotel site within their boundaries is already taken up and cov-

having a cheek with notches, at the sides of which are cutting edges for cutting the fuse. The curved jaws beyond the cheek pieces, when closed, form a circular aperture, around which the jaws are beveled, one jaw having a tongue which fits in a groove in the other jaw.

MOODEY'S FUSE-CAP FASTENER.

The pliers are employed for contracting the end of the cap on the fuse firmly and absolutely water-tight, thus avoiding the dangerous operation of digging out wet and unexploded loads. Miners who have used implements of this class will appreciate the improvement in the one designed by Mr. Moodey. The instrument crimps the cap on the end of the fuse firmly. The fuse-cutter is simple and efficient.

VALUABLE BOOKS FOR SHEET METAL WORKERS.

The Sheet Metal Worker's Instructor for Zinc, Sheet Iron, Copper and Tin Plate Workers, and others: Geometrical Problems; Practical and Simple Rules for describing the various Patterns. By Reuben H. Warr. Tin Plate Worker. With Boiler Making, Mensuration of Surfaces and Solids, Rules for Calculating the Weights of Different Figures of Iron and Steel, etc. Elaborately illustrated. 8vo.....\$2.00

A Practical Workshop Companion for Tin, Sheet Iron and Copper Plate Workers. Containing Rules for describing various kinds of Patterns used by Tin, Sheet Iron and Copper Plate Workers; Practical Geometry, Mensuration of Surfaces and Solids; Tables of Areas and Circumferences of Circles; Joints, Varnishes, Lacquers, Cements, Compositions, etc. By Leroy J. Blinn. 100 illustrations. 12mo.....\$2.50

Galvanized Iron Cornice Worker's Manual. Containing instructions in laying out the different Miter, and making Patterns of all kinds of Plain and Circular Work. Also Tables of Weights, Areas, and Circumferences of Circles. By Chas. A. Valle. Illustrated by 21 plates. 4to.....\$5.00

For Sale for Want of Use.

One horizontal reversible engine, 8x12; one hoisting drum, 30x30, with V friction and eccentric; one gear, 4 feet x 4 inches face; one jack 4-inch head pump; one steel boiler, 36 inches x 12 feet; stack with fronts, wood grate bars; safety rods, pump and heater, etc.; being hoisting works complete. Has been little used. The same can be seen at Glencoe, Calaveras Co., Cal. For further particulars, apply to J. H. Gillispy, 1914 Stockton St., San Francisco.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of February, 1891, an assessment, No. 22, of Three (3) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of March, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of March, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. BARROWS, Secretary pro tem.
Office, Room 11, No. 303 California Street, San Francisco, California.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$825, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.
ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN:—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

(Signed) Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

MARSHUTZ & CANTRELL

The Patentee and Manufacturer cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

The Electric Hoist.

One of the recent applications of electricity for general-power purposes is the electric hoist, which is shown in the accompanying illustration. In this particular field horses have been supplanted by steam, which in turn is now supplanted by electricity, there being the same advantages in this piece of apparatus which are found in the stationary motor for ordinary power purposes. The electric hoist manufactured by the Thomson-Houston Motor Company is simple in construction; it is compact, easy to manipulate, and does the work required quickly and well.

The motor is of the same class as employed for stationary work, with the exception that it is series wound, the speed being regulated by a rheostat placed underneath the drum and controlled by a handle at the operator's right hand. The friction clutch is controlled by a slight motion of a lever held in the left hand of the operator, and is so well adjusted that the heaviest loads can be raised, lowered or held without the use of the brake. The brake consists of an iron strap lined with wood and encircling the drum for more than three-fourths of its circumference. It can be applied by a simple pressure of the foot. The pinions and gears are made of alternate discs of steel and rawhide, and run comparatively without noise,

ELECTRIC HOIST FOR MINING WORK.

mission is necessary. Electricity has proved itself thoroughly fitted to perform this transmission. Where steam-power is used, a concentration of steam plant and distribution of and metallurgical work has received the attention of its most progressive engineers, with the result that the company is now prepared to furnish motor and power apparatus for hoisting,

Portable Ore-Breaker.

The Gates rock and ore breaker, now a very popular machine for mining and other work where ore or rock is to be broken, is arranged in a variety of ways so as to suit special purposes. One of these is the breaker in portable form, shown in the cut, for street or other work where it is necessary to move often. With it is an elevator and a screen for separating dust and dirt from broken stone when required. The elevator or screen or both can be readily detached, for when it is not desired to separate the dust and dirt from the broken stone, the screen will not be required.

The wagon or framework is made of best seasoned oak so as to stand strain. This machine is very useful in road-building, and under certain conditions could be utilized in small mining camps, as, for instance, where many arastras are in use. A portable engine and a crusher would largely help in adding to the capacity of arastras.

THE SPRING HILL DISASTER.—The Mayor of Spring Hill, N. S., has issued an appeal to the public of the cities and towns throughout Canada and the United States asking for aid in behalf of the widows and children of those killed in the mine disaster. The total number dead is now known to be 120. It is evident

THE GATES PORTABLE ROCK-BREAKER WITH ELEVATOR AND SCREEN.

while the use of carbon brushes reduces the wear on the commutator to a minimum.

The mining industry presents a large field for the introduction of electric-power, and one to which the system is peculiarly adapted. Where water-power is available, some means of trans-

electricity is recommended by the best engineers.

The Thomson-Houston Motor Company has been quick to perceive the needs of such cases and adapt its apparatus to them. The question of proper electrical-power apparatus for mining

haulage, drilling, ventilating, pumping, etc., and will furnish plans and estimates for special work.

The earliest known coins were issued by the Greeks in the seventh century B. C.

much suffering will result unless the response to the appeal is hearty and prompt. Not one of the men who could probably throw light upon the cause of the explosion is left to tell the tale. Not only are the coffins idle, but all business in town is at a standstill.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

The Keltz Mine, Tuolumne Co.

[From Our Own Correspondent.]

EDITORS PRESS:—While traveling through Tuolumne county in the interest of the PRESS, I visited the Keltz mine. The property has frequently been referred to, and as the mine is now in a very promising condition, I think your readers will be interested in a short report based on a personal inspection by your correspondent.

The Keltz mine is situated on the east bank of the south fork of the Stanislaus river and is about ten miles north of Soulsbyville, Tuolumne Co., Cal.

The strike of the vein is almost north and south and at this point almost parallels the river. The property consists of three full locations each of 600 feet in width by 1500 feet in length, aggregating 600 by 4500 feet on the vein.

The vein is inclosed in metamorphic slate walls and is accompanied by a mineralizing dyke of porphyry. The width of the vein is from two to five feet with a dip of 55 degrees east.

The quartz is brittle, white, with a ribbon structure carrying free gold, galena and a fair per cent of sulphurets.

The situation of the mine is everything that could be desired for economical development and future working. The north extension reaches down to the river's bank; from this, the north end, a drift can be run for 4500 feet on the vein and a hack 2000 feet on the dip of the vein to and at the south end, on an average of 1500 feet on the 4500 foot of the vein.

Thus far all of the work has been confined to the center location, which is about 800 feet above the river. The present work consists of two tunnels which are being driven to cut the Floyd shoot. This shoot crops 1750 feet above the river. The vein is very strong and prospects across the two to eight feet of vein from \$11 to \$15 a ton throughout the 140 feet that the shoot has been opened. The lower tunnel is now in 650 feet and is being driven ahead on the vein which is here two to four feet in width. The tunnel has about 100 feet to go to cut the Floyd shoot, which it will tap 625 feet on the dip of the vein. The upper tunnel is 500 feet vertically or 625 on the dip, above the lower tunnel, and is now in 150 feet. This tunnel was run at an angle of 5° east and has just intersected the Floyd shoot at its north end. The vein is here opening up in a very satisfactory manner, showing not only the strength that is evident in the lower workings, but a larger per cent of free gold gathered and sulphurets with a small per cent of zinblend. The superintendent is very conservative and will not admit that the high-grade ore extracted at this point is the average of the vein until the shoot has been run to a greater distance. Everything indicates that a richer grade of ore fills the vein at this depth than on the surface and that when the lower tunnel reaches the shoot (625 feet deep) a still higher grade of ore will be encountered.

North of the present tunnel, 400 feet, is a shaft that was put down 400 feet on the vein, which here averaged three to four feet in width of ore that has milled from \$5 to \$54 a ton. The present plant consists of a 10-stamp mill with eliver plates and canvas tables for concentrating. While this has answered the purpose in the past, the mill should be improved by the addition of rock-breakers and concentrators to reduce expenses and increase returns. The mill, ventilating fans and shops obtain power from Knight water-wheels, which are here driven by a very small amount of water, owing to the 550 feet of pressure. This can be increased to 900 feet at the present location of the mill; or by moving the mill to the river's edge, 1700 feet of pressure can be obtained from the ditch, or the free water of the river can be utilized. The entire property is heavily timbered with monerohs of the cedar, fir, yellow and engar pine in quantity far more than sufficient for the most extensive workings of the mine for all time.

By reason of the exceedingly favorable situation of the mine, the great water pressure, size of vein, character of rock and manner in which the mine is operated, the ore, with the present plant, can be mined and milled at a cost not to exceed \$3.50 a ton, and once the capacity of the mill is doubled, and necessary improvements added, this will be reduced to \$2.50 a ton.

The mine is being developed under bond by an English mining syndicate, with Mr. W. Sharwood, who is well known as the superintendent of the famous Sonlhye mine, in charge. In this property the English investors have adopted the methods of the most successful California mining operators in first proving the mine. They, with the people of Tuolumne county, are to be congratulated on the success that has crowned their efforts in the development of the Keltz, which, by reason of its strong vein, milling value and length of shoots, is destined to prove a second Sonlhye.

Mines of Washington.

Opening Up an Important Mineral Country In the Pacific Northwest.

EDITORS PRESS:—It is the purpose of this letter to inform the readers of the PRESS in regard to the mineral resources of Washington—a State which has hitherto been regarded as a lumber region and especially noted for its tall firs and mammoth cedars. Its coal veins have also been known abroad to some extent, particularly in San Francisco, where the mines are chiefly owned and where a ready and lucrative market has been found for the product of the mines. It is the object of this communication to speak principally of the gold, silver, lead and copper districts, leaving the coal and iron, for another time.

Puget Sound Precious Metals.

The country west of the Cascade mountains, or better known as Puget Sound, has always been regarded by miners and prospectors as difficult of access and very hard to prospect in by reason of the dense undergrowth of bushes and moss. During the excitement attending the Frazier river stampede quite a number of Californians attempted to prospect in the vicinity of Mount Baker, but the effort was attended with indifferent results. The Cascades were as a sealed book to the Californians of that day, as they have been to nearly every one else up to last year, when persistent effort succeeded, and there is no longer question as to the existence of gold, silver and lead in paying quantities in the Cascades, extending from Old Mount Si to Mount Baker, a distance of over a hundred miles.

The New Districts.

The region above mentioned is divided up into five mining districts, as follows: Silver Creek, Snoqualmie, Monte Cristo, Sultan and Cascade. The ore in all these districts presents the same characteristics, and the assays are from 20 to 100 ounces silver, from a trace to \$20 in gold, and from 30 to 50 per cent lead. In some instances it runs higher, but the above may be considered a fair average. The country rock is granite, porphyry and slate, and the ledges, which are numerous, are from 4 to 20 feet wide and well defined.

Silver Creek District.

This district is located on Silver creek, one of the principal branches of the North Fork of the Skykomish river, in Snohomish county. It is the source of three other considerable streams—the Sultan, Wallace and Sauk, the latter flowing northwesterly and emptying into the Skagit. This district is distant from Seattle about 90 miles, and is reached by way of Seattle to Snohomish by the Seattle, Lake Shore & Eastern railroad 31 miles; from Snohomish to Sultan City 17 miles by wagon-road or river, thence by trail to Mineral City. This trail will probably be widened to accommodate wagon transportation this spring, as the rapid settlement of the country and increased travel demand better facilities. Engineers are now in the field making preliminary surveys for a railroad to connect the mines with the Seattle, Lake Shore & Eastern, and this branch will probably be built this season. Work is being prosecuted on the Jaspercon, National, Vandalia and Silver Lake group with very gratifying results, and considerable ore is accumulating on the dumps, but no stoping has yet been done on any of the properties mentioned. The ore thus far extracted has been from the working tunnels. About 300 locations have been made in Silver creek district and the site of Mineral City laid out. This will probably be the principal mining camp and trading-point for this district and Monte Cristo, which lies to the east of it. Companies are forming with sufficient capital to develop many of the ledges, and prospecting parties are being organized for further exploration. The indications are that Silver creek will be the scene of great activity this season.

Monte Cristo District.

This district was organized last summer, and adjoins Silver creek on the east and north. Important discoveries of silver-lead ore were made early in the season in the Silver Lake group, and California capital has been interested in their development. Two tunnels have been run and are now in from 100 to 150 feet, showing large veins of rich ore carrying a larger percentage of gold than any yet found in the Cascades. Considerable ore has been taken out, but no shipments will be made until transportation facilities are secured. This district, like Silver creek, offers great inducements to the capitalist, miner and prospector. About 30 locations have been made in Monte Cristo, and there is a wide and attractive field for prospectors.

Sultan River Placers.

Sultan river, which has its source in Silver Creek district, is being prospected for gold, with good results. A company formed for the purpose of turning the river from its natural bed, has been at work for some time past and considerable work has been accomplished. The company anticipates completing the work this season. There is an abundance of water during the entire year, and hydraulic mining can be carried on successfully.

Cascade District.

This district, which takes its name from Cascade creek, one of the principal branches of Skagit river, was organized last summer after the discovery of the Boston mine was made. A

slide in the canyon exposed a large body of galena carrying from 50 to 100 ounces of silver.

Helena (Montana) parties made personal examination of this property soon after its discovery and bonded it for \$150,000. The sale has since been consummated and preparations are being made to work it on an extensive scale. From 50 to 100 locations have been made in this district, many of them very promising prospects. Cascade district can be reached from Seattle by way of the Seattle, Lake Shore & Eastern railroad to Sedro, thence to Hamilton by the Seattle & Northern. From Hamilton there is a wagon-road along the Skagit river to the mouth of Cascade creek, about 25 miles, thence by trail to the mines. Skagit river is navigable to this point by small boats for several months in the year, but the greater portion of the transportation is by wagon and pack animals.

Snoqualmie District.

Prospecting has been carried on very successfully in this district during the past season, and many new ledges discovered. The ore carries gold, silver and lead. The district is about 60 miles east of Seattle and is accessible by the Snoqualmie branch of the Seattle, Lake Shore & Eastern, which will be extended into and beyond the district this year.

The Advantages.

These mining districts possess many advantages over those of the interior. The country in which they are located is heavily timbered with excellent fir, cedar and hemlock. They are but a short distance from tidewater, with which they will soon be connected by rail. Coal of superior cooking quality can be obtained in unlimited quantities within a few miles of the gold and silver mines. Water is also abundant the year round. Smelting and reduction works can be built on tidewater at Seattle, where the ores of Alaska, together with those of Coeur d'Alene, can be combined and worked with those of Washington.

Mining Bureau.

Seattle, which is the natural center of this extensive mineral country, has been slow to appreciate the advantages to be reaped by the opening of these tributary mines and the erection of sampling-mills, smelters and reduction works. Within the past month, however, there appears to have been an awakening and the Chamber of Commerce is calling to its assistance parties familiar with the mines for the purpose of gaining all the information possible, and a Mining Bureau will be organized and in successful operation by March 1st. Samples of ore will be collected from all the mining districts and cabinets arranged in rooms set apart for mineral display.

Seattle, Wash., Feb. 20, 1891.

The Union Mine, Copperopolis.

[From Our Own Correspondent.]

Copper Smelting in Calaveras County.

EDITORS PRESS:—At the time of my visit the genial superintendent, Mr. G. McM. Ross, formerly on the Comstock, was extremely busy and through press of duty could not give me the attention he wished, and for want of time I could not accept his kind invitation to remain until the following day and then inspect the mine and plant. The readers of the PRESS all have in their back numbers a complete description of the Union mine, and in consequence it is only necessary to state what the present plant consists of and the methods at this time employed.

In the mine the ore is coming from the No. 1, 2, 4, 5, and between 7, 8 and 9 levels. The ore bodies run up to 22 feet in width, or an average of 10 feet of vein matter. A large new body of ore has just been opened between the 4th and 5th level, and north of No. 1 shaft. The present output is 60 tons of ore a day. The old Keystone shaft is being cleared out and retimbered.

By reference to former letters by myself, it will be seen that the ore from the Union mine runs from 10 to 15 per cent in copper. All ore from 10 per cent up is smelted; that below is roasted, leached and converted into copper cement. The ores of the mine are especially adapted to this process. The ores as they come from the mine are dumped into chutes and taken thence by tram cars to the roasting floors and smelter, about a half mile distant. The ores suitable for smelting are treated by the Orford Copper Smelter Co., who have here a plant which has been under the charge of Mr. S. C. Lake of the Orford Co. of New York. At present the furnace is just being relined. The capacity of the smelter is ten tons of ore a day, making 450 tons of copper matte per month, equal to 400,000 to 450,000 pounds of fine copper.

This smelter differs from other copper smelters in this: The furnace is dry—not jacketed—built of solid brick with iron cases, which act as an air-chamber in the distribution of the blast. The blast is discharged from the fan directly into the air chamber. The furnace is rectangular, 11½ feet long in the clear, 4½ feet between tyeres, 7 feet from hot-tom to feeding door. The furnace works without the use of crucibles, discharging directly into siphon-pot, where mechanical separation takes place, the metal flowing from one end of the pot, the slag from the other. Separation is then completed.

The slag will not assay, on the average, over

5 to 8-10 of 1 per cent in copper, while the metal will assay from 45% to 60% of copper. The metal after leaving the siphon pot is spilled on to the cast-iron plates in thin sheets to facilitate the breaking up of the copper for sacking. The metal is then sacked and shipped to the Orford Copper Works, N. Y., where it is converted into pure copper.

Since my last visit the smelter has been put in operation and the roasting and leaching plant materially increased. Already great piles of smelting ore stretch out in every direction, reminding one of the burning oil-banks in the coal regions of Pennsylvania. From these reserves the company in time will have an immense revenue from their copper cement alone. The property is now, as in the past, managed by Col. Horace D. Randlett, the well-known copper king.

E. H. SCHAEFFLE

Comstock Ore Extraction.

The following sworn statements of the ore and mill product of Storey county, Nevada, mines have been filed in the Assessor's office:

BELCHER—Produced 3250 tons of ore, yielding bullion valued at \$45,741. Cost of extraction, transportation and reduction, \$62,682; cost of production above yield, \$16,941; cost per ton, \$19.28.

CONSOLIDATED CALIFORNIA AND VIRGINIA—Produced 21,340 tons of ore yielding \$275,496 in bullion. Cost of extraction, \$178,101; transportation and reduction, \$114,160; total cost, \$292,261. Cost of production above yield, \$14,765; yield per ton, \$13.70.

CHOLLAR—Produced 6765 tons of ore, yielding \$84,520 in bullion. Cost of extraction, \$63,115; transportation and reduction, \$47,355; total cost, \$110,470. Cost of production above yield, \$25,950; yield per ton, \$16.33.

CONSOLIDATED IMPERIAL—Produced 1135 tons of ore, yielding \$15,041 in bullion. Cost of extraction, \$34,713; transportation, \$1135; reduction, \$6810; total cost, \$42,658; cost of production above yield, \$27,617; yield per ton, \$13.25.

CHALLENGER CONSOLIDATED—Produced 125 tons of ore, yielding \$1643 in bullion. Cost of extraction, \$14,840; transportation, \$125; reduction, \$753; total cost, \$15,718; cost of production above yield, \$14,075; yield per ton, \$13.15.

CONFIDENCE—Produced 72 tons of ore, yielding \$882 in bullion. Cost of extraction, \$10,337; transportation, \$72; reduction, \$432; total cost, \$10,841; cost of production above yield, \$9059; yield per ton, \$12.25.

CROWN POINT—Produced 3787 tons of ore, yielding bullion valued at \$34,571. Cost of extraction, transportation and reduction, \$55,650; cost of production above yield, \$21,079; yield per ton, \$14.70.

JUSTICE—Produced 2399 tons of ore, yielding \$41,478 in bullion. Cost of extraction, transportation and reduction, \$48,606; cost of production above yield, \$7128; yield per ton, \$20.

MONTÉ CRISTO—Produced 358 tons of ore, yielding bullion valued at \$2408. Cost of extraction, \$1432; transportation, \$268; reduction, \$1432; total cost, \$3132; cost of production above yield, \$724; yield per ton, \$8.74.

OVERMAN—Produced 5150 tons of ore, yielding \$68,110 in bullion. Cost of extraction, \$33,398; transportation, \$5159; reduction, \$30,901; total cost, \$74,458; cost of production above yield, \$6348; yield per ton, \$14.46.

OCCIDENTAL—Produced 4257 tons of ore, yielding \$78,273 in bullion. Cost of extraction, \$45,900; reduction, \$30,056; total cost, \$73,956; yield above cost of production, \$4317; yield per ton, \$17.37.

SAVAGE—Produced 9622 tons of ore, yielding bullion valued at \$130,053. Cost of extraction, \$74,924; transportation and reduction, \$67,354; total cost, \$142,278; cost of production above yield, \$12,220; yield per ton, \$14.79.

YELLOW JACKET—Produced 4849 tons of ore, yielding \$64,218 in bullion. Cost of extraction, \$56,156; transportation, \$4849; reduction, \$29,097; total cost, \$90,103; cost of production above yield, \$35,885; yield per ton, \$18.60.

The number of tons aggregated 63,109, which yielded bullion valued at \$342,439. The cost of production totaled \$1,022,884, and cost of production above the yield, \$180,445.

CALIFORNIA'S PARKS.—The effort of California State officials to have the Yosemite and Sequoia Parks of California policed by troops of the regular army have prevailed. General Gibbon's recommendation for a detail of Captain Wood's company of the Fourth Cavalry and Captain Dore's company of the same regiment for this duty has been approved by the Secretary of War. These two companies are now at the Presidio. The former is hooked for Yosemite Park and the latter for Sequoia. May 1st is the time set for taking up their station in these parks. Should any emergency arise in the meantime, requiring the presence of troops, General Gibbon has been authorized to call upon troops H and E at Fort Walls Walls and Vancouver Barracks, respectively.

THERE is a movement on foot for the establishment of a mining bureau in Seattle in connection with the Chamber of Commerce. The purpose of the Bureau is to furnish information regarding the different mining districts on Puget Sound and in Eastern Washington, and also to collect samples of gold, silver, lead, copper, iron, coal, asbestos, etc., for exhibition.

Amalgamation at the Comstock Lode.

A Historical Sketch of Milling Operations at Washoe and an Account of the Treatment of Tailings.

NUMBER VII.

[By A. D. Hodors, Jr. Read before the American Institute of Mining Engineers.]

IX. Discovery of the Tailings Process.

In 1862-63 Louis Janin was metallurgist of the Mexican mill at Empire City, where the ores were worked by wet-stamping and amalgamation in the batteries and in Mitchell's screw amalgamators. The tailings were dried, roasted in reverberatory furnaces, and amalgamated in barrels. Raw amalgamation in barrels was also tried—with partial success. In 1864, Janin was called to the old Gould and Curry mill. This establishment had made a failure with the Veatch process, which was thrown out that year, wet crushing and pan amalgamation being substituted. The mill had a large amount of tailings on hand, including slimes, which assayed as high as \$130 per ton, and blanket concentrations. The richest slimes were hauled to Franktown and amalgamated in Dall's mill by the barrel process. Janin put up experimental pans and worked the remaining tailings in various ways, generally trying to imitate the patio process. Experiments were also made in patio-yards, but these were a complete failure, while those carried out in pans were attended with a fair measure of success. They all indicated strongly the utility of bluestone and salt, but the full appreciation of these reagents was delayed by the difficulty of disposing, without very heavy discounts, of the heavy bluestone produced. Bankers were afraid of it, and everybody was trying to get fine bullion.

In 1866 the Gould and Curry Co., built the Reservoir mill, a short distance below its large quartz-mill, for the purpose of working its tailings. This was the first mill built expressly for the treatment of tailings, with the possible exception of one or two crude miniature establishments of sluice-owners in Six-Mile canyon. It had 14 flat-bottomed pans, and was operated by the Gould and Curry until that company went out of the milling business and, in 1870, sold it to Parke and Bowie, who enlarged it and named it the Railroad Mill.

Janin seems to have been confident of success as early as 1866, when he, with Charles Bonner and Ira S. Parke, built a large reservoir in Six-Mile canyon, a short distance below the Reservoir mill, to collect the tailings and slimes from both Six-Mile and Seven-Mile canyons. Within a year about 100,000 tons were collected, assaying from \$8 to \$24 per ton; and in September, 1867, Janin commenced to work the material in the Canyon Tailings-mill, which he had built near by for this purpose. The first runs were most encouraging, but a freshet in the following December swept away about half of the contents of the reservoir; and as the flood carried off the greater part of the rich slimes, from the treatment of which large profits were expected, the result was disheartening, although by no means disastrous.

The possession of a mill of his own enabled Janin to push his researches (which with the aid of subordinates, he had kept up constantly) with more independence than before. He tried various chemicals but always obtained the best results with sulphate of copper and salt, although these reagents produced a poorer amalgam, and, with the apparatus then used, the quicksilver was fouled and its consumption was large. Up to this time the usual method was to grind the pulp in small flat-bottomed pans, then thin it, and discharge it without settlers. Increasing the size of the pans and using settlers remedied in great measure the fouling and loss of quicksilver. Especial trouble was found in treating slimes which, when amalgamated fresh from the reservoirs, would remain in lumps in the pans, robbing the quicksilver and refusing to yield up the precious metals. But this difficulty was overcome by drying the slimes, the lumps then readily dissolving in the pans. The ever-varying quantity of gold and silver in the hatches worked, and the presence of amalgam caught with the tailings, augmented the troubles encountered in the experiments, by introducing an element of uncertainty as to the actual results obtained. Furthermore, the ores from the different mines did not work alike, the percentages of bullion-yield varying greatly under precisely the same conditions of treatment. Particular difficulty was found with the Obollar-Potosi slimes which, notwithstanding an excess of bluestone, produced only fine bullion. This result was attributed by some persons to decomposition of the bluestone by the oxide of manganese which was present in the ore. Others have thought that probably the injurious agent was an alkali or alkaline earth.

Henry Janin, having become financially interested with Louis, visited Washoe in 1868; and the two brothers (aided later by Alexis Janin) made a systematic, extensive and costly series of experiments, which thoroughly demonstrated the efficacy of bluestone and salt. Henry Janin came to the conclusion that dichloride of copper was the active reagent in the reduction of sulphurets of silver, and thought its direct use in the pans would be greatly superior to the use of salt and bluestone. He obtained a patent for this process; but the brothers never did more than experiment with the methods, con-

fining themselves to the question of the proper proportions of copper sulphate and salt. This question they solved to their satisfaction; and when they accepted the fact that base bullion was a necessity, and ceased trying to make fine bullion, their success was complete. They proceeded to secure slimes and tailings from all sources and to engage extensively in the business. They had apparently a fortune in their grasp. But it was impossible to keep their process secret; and when the ore supply from the mines became scarce and concentrated in the hands of a few millmen (as before described) all the mills began to save their tailings and slimes and to work them up for themselves. Moreover, other tailings-mills were built, and the competition became keen.

X. Development of the Tailings Business.

At the end of 1865 or the beginning of 1866, J. R. Andrews & Co. built large reservoirs on the flats at Dayton, and caught the tailings coming down Gold canyon. The amount collected here in 1869 was estimated at 400,000 tons, assaying from \$15 to \$30. Quite a large quantity was much richer, one reservoir, which was afterward purchased by Birdsall & Co., assaying about \$60. The mill here, a small establishment, originally built in 1864 to work ore, and known later as the Dayton reservoir mill, was purchased and started in the fall of 1866 by E. Wertheimer and Dr. Brerly, who sold out to Louis Janin and Leon Baldwin. This firm altered it, and put in five McCone pans, each holding 4000 to 5000 pounds of tailings to the charge, and treating four or five charges daily. Baldwin sold his interest to Janin, who, in 1871, tore down the old building and erected a new structure on the same site. The mill worked a part of the tailings collected in the Dayton reservoir; but the main portion of these passed into the possession of Birdsall & Co., and the Dayton reservoir mill finally was obliged to close down.

About 1867, Janin and Parke started a large reservoir on the banks of the Carson river, three miles from the mouth of Six-Mile canyon, the flow of water and tailings in this canyon being caught up and led in a ditch to the reservoir. At one time (about 1869) the contents of this reservoir were estimated at 200,000 tons. The quality was much poorer than that of the material impounded at sites nearer the stamp-mills. The average assay value was only \$7 or \$8, according to samples taken in 1875; but much poor material and even waste (brought down in seasons of abundant water) had been allowed to run in. No attempt to work the tailings here was made on a large scale until 1870, when the Carson Valley Tailings Company put up a mill with ten large Parke pans, holding eight tons to the charge. It was generally understood that the profits of the company were meager.

In 1869, Augustine of Silver City put up a mill with four large pans, on American Flat, to work the tailings from a reservoir below the old Bay State mill. This tailings-mill ran irregularly, and with results which were apparently unsatisfactory.

D. E. Avery had an establishment in Washoe valley called the Back Action (if I remember aright), which worked tailings on a small scale. It was built in 1866, and then had eight arrastras. Concerning this mill, I have only scant information. I imagine that it was not a great pecuniary success.

In Six-Mile canyon there were a number of mills, some of them curious little home-made affairs which worked blanket concentrates principally. Bassett's mill, originally built with 16 stamps, was using a barrel process for tailings in 1865, but was credited with six pans in the statistics of 1866. Jennings, Proctor, Evans and one or two others had establishments which ran more or less intermittently. Jennings, I think, outlasted the others.

The Atlanta mill, at Johnstown, in Gold canyon, erected in 1865 with ten stamps, was owned by W. Hill & Co., who altered it to a tailings-mill. In 1871 two large Parke pans, eight feet in diameter, were put in. The owners worked tailings for a number of years from a reservoir near by.

Not far from the last mill was the Keystone, built in 1865 with five stamps, and changed subsequently to work tailings. It was owned by Rulison and Lykens, who afterward moved it nearer Dayton. It was operated whenever pay material could be obtained.

Concerning the mill of Birdsall & Co. (afterward the Lyon Mining & Milling Co.), which was built originally for crushing ore, detailed information will be given in a subsequent part of this article.

Besides the tailings-mills above mentioned, quite a number of stamp-mills engaged in the tailings business when supplies of ore from the mines were unobtainable—as the Woodworth mill, on the Carson river at the foot of Daney canyon, where large amounts were treated.

The result of the increase in the number of mills working tailings was that in time rich tailings were not to be bought; even low-grade material was very difficult to get at paying prices, and the Janins were gradually forced out of the business. When they had retired there were only two large tailings companies in successful operation at the Comstock—Parke & Bowie in Six-Mile canyon, and the Lyon M. and M. Co. at Dayton.

Ira S. Parke and David Bowie owned two mills—the Railroad mill, formerly called the Reservoir mill, which they had bought from the Gould and Curry company in 1870; and the Canyon mill, which they purchased from Janin

about 1872, enlarging it and changing the name to Express mill. Parke was a good millwright and an able and energetic worker, who had learned the tailings business from the Janins. The firm secured large reserves of tailings, and operated for several years, apparently with great success. They did not, however, appreciate the importance of close assaying and of chemical studies, but sought only for improvements in mechanical details. They had no assay office connected with their mills—in this respect, however, merely following the usual Comstock custom—and were content to work without any exact knowledge of the values of the material which they treated, values which were varying constantly. Hence they had only hazy ideas of the accuracy of their work, and were liable to make (and did make) costly mistakes.

Parke was constantly changing the size and form of his pans and settlers, and seemed to have a mania for large pans. He undoubtedly introduced several improvements, but eventually overdid the thing. He increased the size of the pans to 6, 8 and 10 tons per charge, and in this his example was followed very generally. The extreme dimensions reached were 12 feet diameter by 8 feet high. Increasing the size was found beneficial to a certain extent, but the largest pans were complete failures. He then began to increase the number of millers in each pan. He invented a 2-muller pan which was 11 feet long, 5½ feet wide and 5 feet deep, held 5 ton charges and was provided with 2 settlers. At first the millers ran in opposite directions, later in the same direction. He had a 6 muller pan, also in the shape of a trough, but with very small millers. He built 3-muller and 4-muller pans. No one, so far as I know, copied these multiple-muller pans, nor was it easy to find out the exact results obtained with them, owing to the loose manner in which all the experiments were made. It was plain, however, that large motive-power was demanded, and that the construction was expensive.

In 1874 quicksilver had risen in price from 60 cents to (at least) \$1.30 per pound, and the price of silver had fallen greatly. This added essentially to the troubles of the tailings mills, which were then struggling with low-grade material, and proved fatal to Parke and Bowie, who accordingly failed. In fact all the tailings mills in Washoe, except the Lyon mill, closed down this year, some temporarily, others permanently; and none (with the exception noted) made any long runs thereafter. The Express and Railroad mills were sold. Ira Parke ran them subsequently for account of his creditors, but he died before long. His place was taken by his brother, Frank Parke, who a few years after died in the same manner as Ira—being run over by the steam cars. The success of the mills during these last years was very limited.

The best arranged, best equipped and most successfully conducted tailings mill ever operated was the Lyon mill at Dayton. This was built in 1865 by Birdsall and Carpenter to crush ore. Carpenter soon sold his interest to Birdsall, who was invited by Sharon to join the Union Mill Company, but declined. The mill then found it impossible to obtain adequate ore-supplies, although its charges for hauling and working were as low as \$8 per ton; and for several years it ran intermittently and without much profit.

When the treatment of tailings began to attract attention, George Langtry, a most energetic and able millwright, induced Birdsall to undertake this branch of the business. Birdsall owned land adjoining the Andrews property at the mouth of Gold canyon, and here Langtry put up concentrating apparatus, receiving in return a small interest in the mill, of which he was soon after made superintendent. When the Janine perfected their process, Langtry found out the details and copied them with success. In 1869 the company purchased the rich Andrews reservoir, added 20 pans to the mill and worked on a very large scale, at one time amalgamating 250 tons daily. But in order to keep up this rate of treatment, it was found necessary to work the slimes "green" from the reservoir, and the company gave up this wasteful procedure and reduced the daily amount treated to about 150 tons.

George Langtry was, all things considered, the best tailings-mill man of Washoe. He differed from the ordinary "practical" man in many respects, perhaps in none more remarkably than by recognizing and acknowledging the fact that his want of chemical knowledge was a serious deficiency. To remedy this deficiency, he sought always to have a capable metallurgist connected with the establishment. Under his management, and the subsequent guidance of his pupil, the Lyon mill achieved a success unparalleled in the history of tailings-mills. From 1869 to 1878, notwithstanding the decline in the value of the material worked and of the silver produced, and in spite of the great increase in the price of quicksilver, the mill steadily yielded large dividends. The company had a working capital sufficient for the purchase of large amounts of rich slimes and tailings whenever such came into the market. The mechanical skill and great executive ability of Langtry, supplemented by the chemical knowledge of his assistants, were sufficient to overcome each new difficulty in amalgamation as it arose, and enabled the mill to run on low-grade material which no other establishment could treat with profit. Thus, when the price of sulphate of copper was raised to an excessive height (it touched 24 or 26 cents per pound), the com-

pany's officers were found competent to put up and run acid chambers and bluestone works with such success that the mill obtained its own supplies at low figures, and large revenues were derived from sales to others. When the discount on base bullion reached 27 per cent in 1874, a process for refining this bullion was promptly devised, whereby not only were fine silver and fine dore bars turned out, reducing the discounts, but also, through the recovery of the copper previously lost, in the place of additional expenses, additional profits ensued. This process, it may be noted, solving the difficulty which so long delayed the financial success of the Janin brothers, rendered their method practically complete. Moreover, as no one else ever succeeded in refining bullion so rich in copper, other mills sent their product to the Dayton refinery, to the financial advantage of the Lyon mill.

Langtry died in harness in 1875, but so long as his methods prevailed the mill was operated with financial success, and although the tailings treated sank in assay value to about \$5 per ton, it was found possible to earn and pay continuous dividends. But when his pupil resigned in 1878, and a new management imbued with radically different ideas was established, dividends became painfully rare.

In 1877 the bonanza firm built their large tailings-mill on the site of the old Gould and Curry mill. It was the last successful mill of the kind erected at the Comstock, and was appropriately named the Omega. It had a daily capacity of about 170 tons and ran a number of years on slimes and tailings from the Consolidated Virginia and California ores. It was provided with a couple of long-cylinder furnaces for drying the slimes, and with a refinery, built in 1878 after the plans of the one at Dayton. It was operated successfully, I am told, until it exhausted its supplies.

Early in the eighties a small mill was built by Conrad Wiegand and others, east of Virginia City, near the railroad tunnel. It was erected after my departure from Washoe, and I have no detailed information concerning it. The intention was to work the tailings of the old Lynch reservoir, which were supposed to be very rich. These tailings had been offered previously to the Lyon mill, which sampled and assayed them, finding the material to average only about \$6, if I remember correctly. The Lyon mill gave its assay results to the owners, who refused to believe the figures. Conrad Wiegand, the well-known assayer, made some assays, obtaining much higher results, and put about all the capital he had into the company which built the mill. I have been told by a person who was connected with the establishment that the mill runs verified the Lyon mill assays, and that the mill was a complete failure from the start. This failure is supposed to have been one of the principal causes of poor Wiegand's tragic death.

(To Be Continued.)

MANUFACTURING ESTABLISHMENTS INCREASE. According to J. H. Gilmore, special agent for the collection of census returns in this city relating to manufactures, the work here will be completed in a very short time. Strict secrecy is maintained by him as to the statistics contained in the schedules, the last of which will be in within two weeks. Four thousand two hundred schedules have already been forwarded to the Census Bureau in Washington. Before being forwarded all the details called for were carefully looked up and the returns well scanned. Although Agent Gilmore and his deputies will not furnish any information, it has been gathered from the returns for the tenth census and the returns already filed during this census that there were over 1300 more manufacturing establishments in this city in 1890 than existed in 1880—a very notable increase.

THE ELECTRICAL ADHESION QUESTION.—The reality of electrical adhesion and of making a practical use of it in operating railroad trains is still under discussion among engineers, with the odds in favor of the affirmative. It is claimed that adhesion is clearly manifested even when the rails are covered with water or oil. The advantages which it is thought may be derived therefrom are claimed to be manifold. It would seem to be a matter of ready proof whether there is anything in it or not. The philosophy of the principle, if it exists, is thought to be in a slight heating and consequent softening of the surfaces of both wheels and rails. It is well known that even a weak current of electricity produces a great heat upon the surface of iron when passed over it.

THE Senate has passed a bill which requires that every corporation doing business in this State is to pay mechanics and laborers employed the wages earned by and due them weekly (or monthly) on each day in each week (or month) as shall be selected by said corporation. A violation of the Act shall entitle each of the said mechanics and laborers to a lien on all the property of the corporation for the amount of their wages, which lien shall take preference over all other liens, except duly recorded mortgages and deeds of trust.

THE Northern Pacific Smelting Works, four miles from the city of Spokane Falls, have been completed and are ready to start. The capacity is from 150 to 200 tons per day.

THE demand in the East for Utah asphaltum is very great, and the company has been unable to obtain cars enough to meet the demand.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RICH STRIKE.—*Ledger*, Feb. 20: S. W. Bright has had two or three men working on his claim in the slaughter-house field for some time. They have sunk a shaft 40 feet deep, besides running a tunnel into the side hill. It has always been looked upon as a very promising prospect, the ore body being large and yielding a good prospect. On Wednesday night, however, they struck quartz of an immensely rich character. Mr. Bright showed us a specimen weighing about two pounds, which is plentifully sprinkled with coarse gold. Such ore would surrender many hundreds of dollars to the ton. There is said to be a well-defined ledge from 6 to 16 feet wide, a large portion of it showing more or less free gold. The general character of the rock, outside of the free gold, is very similar to the Zeile ore. It is not a pockety nature, as it carries a heavy percentage of sulphurets. The claim is known as the Bell Wether mine, and is not more than half a mile east of Jackson.

BELMONT MINE.—The newly-organized company is now under good headway. One thousand feet of steel T rail has arrived at the mine and will be laid in the open cut and the company's 10-stamp mill started on surface ore. On the 160-foot level work will be carried on in a northeasterly direction.

MISCELLANEOUS.—The crushing of the ore from the Pioneer mine, at the Zeile mill, did not pan out well. The yield fell below a paying figure. The owners, however, are not much disappointed at the result, as it was merely surface rock, and pay-ore was not met with in the Kennedy mine adjoining until 800 or 900 feet was reached. The Zeile is running to its full capacity again. During the long spell of partial suspension of the mill, owing to repairs to the shaft, the sulphurets worked cleaned up the entire pile of sulphurets which had accumulated. It is reported that the mill of the Amador gold mine will be used for a test crushing of ore from the De Witt tunnel in Hunt's gulch.

A NEW MILL.—*Amador Dispatch*, Feb. 21: Recent tests of rock from the old Casco, or Hardenbergh mine, have proven very satisfactory to the owners, and we understand that Mr. J. B. White is up from San Francisco for the purpose of making the necessary arrangements for putting up a 10 or 20 stamp mill on the premises as soon as possible.

Butte.

THE GOLDEN GATE DAM.—*Oroville Mercury*, Feb. 20: It gives us pleasure to chronicle the fact that the great dam of the Golden Gate mine stood as firm as the rocks adjoining it during the very high water of the past few days. Being in the main Feather, at a point where the accumulated waters come rushing from all the old branches of the Feather and from a thousand tributaries that drain hundreds of miles of the Sierras, many people feared disastrous consequences. Col. McLaughlin never for a moment lost faith in his work. Now, as the flood has gone on to the sea and the dam remains, the work can truthfully be pronounced the best ever done in California mining, as never before has a dam on the Feather withstood the floods of winter. Those who saw the river at the mine on Sunday afternoon and Monday morning, say it was a grand sight. The vast body of the river came surging down the canyon and rolled over the dam upon the rocks below, producing the splashing foam and thunder of Niagara. When the waters subsided, it was gratifying to see the dam firm in its place and without injury.

El Dorado.

ELECTRICITY AND MINING.—*Mountain Democrat*, Feb. 21: Wm. Husband, of the Delmatia mine, Kelsey, was in town during the week. Mr. Husband had seldom gets in to see us these days, as he is in charge of the electrical works on the mine, and the continued successful working of this mine requires his constant attention. But few of our citizens realize that this mine is the most successful enterprise in our county, and that it is demonstrating the worth of El Dorado county mines, if judiciously managed.

PACIFIC.—The Pacific management are doing a large amount of work on the various claims under their control, and are bound to find and open out the mineral bodies in their extensive holdings, and the indications are that the work will be justified by the developments.

KELSEY.—*Georgetown Gazette*, Feb. 19: Several of our placer miners made early preparations to work their claims, but owing to the mild winter they are still idle.

GEORGETOWN.—No matter what the impression is abroad, miners hereabouts are confident that this is soon to become a lively mining camp. A number of the right sort of men are already looking into some of our propositions with much favor, and active development of two more properties in this district is already assured to soon begin.

FRENCH CREEK.—*El Dorado Republican*, Feb. 19: Turnbow Brothers and M. D. Brandon have been opening their mine. They have run a tunnel which tapped the ledge about 50 feet from the top, the work showing a 20-foot ledge.

Calaveras.

AROUND MURPHYS.—*Cor. Calaveras Prospect*, Feb. 21: Mining operations in this region are being pursued systematically, and to all appearances everything is in a fair state of development. Thus far this season, but little outside prospecting has been done. The argument of "slate vs. lime" is one frequently heard and is one of consideration. Most old miners of experience affirm that the prospecting must be done out of the limestone belt, either above or below or good and defined ledges. Limestone possesses some good quartz, but in irregular masses without walls or absolute system. The region of Forrester's ranch and beyond, east of this place, is virtually in its incipency in the prospecting line. Years ago some flatteringly rich rock was found there and strange to say, but little work has ever been done to discover the fountain head of the pay ore. James Taylor, a prospector of years, found at one time some splendid ore as far up nearly as Avery, but claims he could never find the lode. The Stanislaus district is still maintaining its celebrity as a mineral belt, and several good dis-

coveries have lately been made there. Taylor & Sibels mine, found a short time ago, gives great promise, and it is expected good reports will follow. Echo Placer mine is in new hands at present, and under the direction of Mr. Frost, who is pursuing the work upon the property in an energetic way. Carley Bros. at Old French Camp are "on the track" of a pocket, several of these splendid "mining objects" having been found there in years past, and being in the belt of the famous John Gamble mine from which \$16,000 were extracted in a short time. Will Carley had on exhibition last Sunday a handful of beautiful specimens of pocket quartz filled with large chips, that made one's eyes dazzle with their richness and splendor. The only trick is to find the gold by the tuff.

WEST POINT.—*Cor. Calaveras Chronicle*, Feb. 21: The town has been in a state of apathy for some time, but at present the outlook is much brighter. Business has been dull since the holidays. Owing to the "jack-in-the-box" system of paying men that some of the mines hereabout have adopted, money is very scarce, and many miners, rather than take 60 or 75 cents on a dollar for their pay, have quit the mines and gone to prospecting. At no time for years have there been so many prospectors hunting for paying leads. In the spring there will undoubtedly be some good cleanups by the prospectors. The Bleeding Steer mine is looming up again and has a big crew of wood-choppers at work. Capt. Tibbe of the Smith mine is putting up new hoisting works and machinery on his property. The knowing ones say the Captain has a good thing.

Inyo.

MODOCK MINES.—*Independent*, Feb. 20: Mr. Frank Fitzgerald reports that the value of ore sold from the Modock mines during January was \$4470. The three 8-hour shifts are driving a tunnel to cut a body of ore in the Argus shaft. A new prospect in the Black Warrior mine is turning out one ton of high-grade ore per day. Mr. Fitzgerald has 22 men employed at present. There is a postoffice at the camp and mails are delivered regularly; a large and comfortable reading-room is provided and well supplied with newspapers and other reading matter. There is abundance of good water and every facility afforded for the men to be clean and comfortable.

REDDING CANYON.—*Register*, Feb. 19: The Hill & Anderson claims in Redding Canyon are said to be developing in most satisfactory shape. In the Georgia the ledge has widened to eight inches of high-grade ore, with a downward pitch. The work in the Enterprise shows a chimney estimated to contain 100 tons of rock of which the lowest assays exceed \$100, and it is believed the ore to smelt to, if not above this figure.

Mono.

PATTERSON MINING DISTRICT.—*Chronicle-Union*, Feb. 14: Patterson to the front! The Homestake mine, owned by A. P. Sayre, has a three-foot ledge of good ore. Mr. Sayre has some 50 tons of \$60 ore on the dump, and 1½ tons, that will mill \$1000, which he will ship to San Francisco. Some time ago he shipped 3000 pounds, which netted him over \$400, but the present strike is much richer, and is 50 feet lower down, in the tunnel run south from the bottom of Silverado Canyon. It is a good feature in this mine that it is in the bottom of a canyon and nearly 2000 feet from the top of the mountain in which the Kentucky is situated and is supposed to be on the same ledge. This is better than to find a mine on top of a ridge, which is too often a surface lode, like a wedge. Thomas C. Sharp is taking out ore from the old workings of the Thoroghrace mine for a run in the Monte Cristo mill. John H. Sheehan is working three men in the lower tunnel of the Kentucky to tap three bodies of ore above. Some of these are very rich, going into the thousands. It is all virgin ground. The Monte Cristo has started up again after a short shut-down. It looks better now than ever. R. T. Sorenson will soon commence work on the Theodore, which is on the same ledge as the Thoroghrace. As a whole, the prospects of this district were never so flattering as now. The discovery in the Homestake of richer ore in the lower tunnel is convincing as to the existence of permanent and defined mineral-bearing ledges in that section of Mono county.

Nevada.

STRUCK RICH GRAVEL.—*Transcript*, Feb. 20: For three years past Dan Cole, H. F. Briggs, Wm. Byington, A. Busch, Geo. Gale and other prominent citizens of Sierra county have been prospecting the Golden Giant and other drift claims on the ridge a mile above Nigger Tent. Day before yesterday they struck, in a tunnel which they have put in about 1500 feet, gravel that pays \$4 a carload. They have the ledge located for a distance of about two miles. San Juan and Bloomfield parties are prospecting on the same ridge and this side of the Golden Giant. They are running a tunnel to strike gravel they found last year by sinking.

NORTH STAR.—*Tidings*, Feb. 20: Work in the main shaft has been continued with great activity during the past six months. In the three months (Sept., Oct. and Nov.) the shaft was sunk 77 feet, attaining an increased depth of 124 feet from June to December, working ten-hour shifts with power drills. Sinking will be resumed immediately on contract. Many changes have also been made to facilitate deeper mining and perfect the line of pumps in use. At the 1400, 1700 and 2000 levels, 16, 12 and 10-inch plungers have been placed. New 12-inch column pipe has been laid from the 1400 to the 1700 and new 8x10 inch rods connected from the 1400 station to the 2000 station. A 16-inch plunger at the 500 and an 8-inch lift at the 2100 completes the system of five pumps used at the North Star mine. The very favorable winter has made the many improvements possible without any stoppage to the mill or diminution of quartz supply. Connections will shortly be made in the 2000 stope and drifting commenced on the 2100 level. In the 1900 level a large body of ore is being opened, stoping continuing in the 1600, 1700 and 1800 levels. The year 1891, so auspiciously opened, promises well for a large and profitable output.

Shasta.

GOOD QUARTZ.—*Redding Free Press*, Feb. 21: Harrison, Lyons and Meeks have struck good quartz in Quartz hill. They have a tunnel about 120 feet long, and come into a horse of broken formation. The quartz prospects well. They will go through the ledge which is thought to be at least 20 feet wide. Fred Grotefeld visited the Texas & Georgia and Calumet mines this week and was delighted

with what he saw. Fred thinks that the Old Diggings is the coming camp. The recent developments in the Texas & Georgia place that mine in the front ranks of mines in this county, and the rich vein discovered still shows up well. At the Calumet Mr. Paul has 25 arastras going day and night; there is an abundance of ore and everything is going along satisfactorily.

Sierra.

STRUCK PAY.—*Mountain Messenger*, Feb. 21: George Gale was in town Thursday, and reports that he has found good pay gravel in the Golden Giant claim, located on the ridge below the Mountain House. The company has been running a tunnel for the past two years or so, and last year put in an air compressor and machinery. This find insures that the channel follows the ridge down to Yuba county and renders certain the value of a large number of claims. The gravel was found in an upraise about 170 feet perpendicularly above the main tunnel. Not enough work has yet been done at the top to determine the exact lay of the lead. The gravel and gold both show it to be high on the rim. Prospecting is being pushed to secure data upon which to push the main tunnel into the channel.

Tulare.

MINERAL KING.—*Tulare Times*, Feb. 19: There is a prospect of work being resumed in the Mineral King mining district soon. An English company has relocated a number of claims there for the purpose of developing them, and it is to be hoped that a big bonanza will be uncovered there. There is no doubt but what the veins of this district contain both silver and gold in paying quantities, but the trouble is the ores have proven to be very rebellious.

Yuba.

SMARTSVILLE.—*Grass Valley Tidings*, Feb. 19: Smartsville, in Yuba and just over the border of Nevada county, is now one of the liveliest camps in the State. The late citrus fair at Marysville did much to advertise the capabilities of this old mining camp, where thousands of dollars have been extracted from Mother Earth. A great many parties have ordered small numbers of orange and lemon trees for planting, and soon the gardens of the miners will be as rich with the golden fruit as the mines are with the real simon-pure material. Three mines are at present being successfully worked in the vicinity of Smartsville. The Deer Creek mine, of which H. B. Wheaton is superintendent, is looking well and dividends are regularly declared to the stockholders. The Blue Point is also one of the paying mines of Smartsville district. At the Ayer mine drifting is being pushed as rapidly as possible. A shaft has been sunk to a depth of 72 feet. Fifty men are employed at regular wages. W. J. Stewart is the superintendent and Will Grant of Rough and Ready foreman. This mine is owned principally by J. C. Ayer & Co., of Sarsaparilla fame. The company have in contemplation extensive improvements, which if completed will enable the mine to be worked successfully for many years. Arastras are used at all the mines, they having been found more serviceable than stamp-mills for crushing the cement. The pebbles are not crushed but simply ground, the gold adhering to the outside. Each mine has three arastras, with a capacity of about 70 tons in 24 hours. The arastras are kept running night and day, being charged about every two and one-half hours. A charge is about a ton of gravel or cement. Boulders are very plentiful, constituting about 65 per cent of the gravel. Pelton wheels are used to run the arastras. The Ayer mine was formerly the property of the Excelsior Co. If the contemplated improvements are made by the Ayer Co., Smartsville will have a boom, both in the mining and fruit-raising industries.

NEVADA.

Washoe District.

JUSTICE.—*Virginia Enterprise*, Feb. 21: The north drift on the 822 level is out 328 feet. The face is in hard ground. The south drift from No. 1 winze, 490 level, is out 139 feet. The face is in fair-grade ore. Shipped to the mill during the week 190 tons. Average battery assay \$17.27 per ton.

KENTUCK.—Have advanced raise in the east ledge, 1000 level, 7 feet; total height, 28 feet; top is all quartz of low grade on the average, but containing spots of ore. The north drift on this level was advanced 15 feet, making its total length from the east crosscut 400 feet; face in a mixture of porphyry and low-grade quartz. Started north drift from raise in the west ledge on this level on the second floor, which is now out nine feet; face in quartz containing stringers of ore, some of which we are able to save for pay.

SAVAGE.—During the week we have hoisted 596 carloads of ore from the 400, 500, 750, and 1300 levels. Shipped to the Mexican mill 512 tons and milled 590 tons of ore; the average battery assay of which was \$14.10 a ton; bullion on hand amounting to about \$12,665.40. No. 1 east crosscut from the southeast drift, 1300 level, from the Savage shaft, was advanced 17 feet; total, 168 feet. Last Thursday night quite an unexpected heavy flow of hot water broke in from the face of this drift, which has temporarily interrupted work in its face. At a point in the winze, 75 feet below the 1300 level, we have finished the station for the intermediate level and have started north and south drifts therefrom. Both drifts are in quartz showing bunches of good ore.

YELLOW JACKET.—Shipping 40 tons daily of ore worth \$19 a ton, as per battery samples, to the Brunswick mill and doing extensive prospecting work throughout the mine.

BENTON.—\$79,000 in the treasury. **CONFIDENCE.**—The joint Confidence and Challenge west crosscut from north drift on the 1100 level is out 179 feet, 24 feet having been added during the week, the face showing porphyry.

CHALLENGE.—East crosscut from the 300 level is out 50 feet, 13 feet having been added during the week; face in quartz of no value.

CON IMPERIAL.—The work of following up and taking out small streaks of ore on the upper levels and overhauling the old stopes of the mine is still being carried on.

OVERMAN.—Extracted 422 tons and 800 pounds of ore. Car samples average \$14.23. Shipped to the Brunswick mill 427 tons of ore; battery samples average \$15.31 per ton. On the 1100 level the incline upraise from the northwest drift has been extended 17 feet through porphyry and quartz; total length, 164 feet. Incline upraise from south drift

has been extended 14 feet through ore of a fair grade. Total length, 179 feet. On the 1200 level upraise on northeast drift has been connected with the 1100 level.

CROWN POINT.—The west drift on the 500 level has been advanced 25 feet since last report, making its total length 67 feet. The face is in soft porphyry with little water seeping from it. The repairs on the 600 level are progressing rapidly. Are still extracting a few cars of ore per day from the 1300 stopes.

BELCHER.—No. 3 west crosscut, 300 level, west ledge, is out a total distance of 77 feet, having been advanced 37 feet since last report. The face is in porphyry and low-grade quartz. The 1400 level east crosscut is advanced 21 feet and is out a total distance of 57 feet. The face is in quartz assaying from \$2 to \$5 a ton.

SEG. BELCHER.—The east crosscut from the south lateral drift on the 600 level is out a distance of 47 feet, having been advanced 31 feet during the week. The face is in a mixture of porphyry and clay.

HALE & NORCROSS.—On the 900 level the west crosscut on our north boundary line was advanced 25 feet, making its total distance 210 feet. The face of this drift has reached the west clay wall of the vein and has been discontinued. On the 1100 level the east crosscut on our north boundary line was advanced 20 feet; the face is in low-grade quartz mixed with porphyry. No. 1 west crosscut, started 60 feet north from the 1400 level station, was advanced 105 feet, having been extended 20 feet since last report. No. 2 west crosscut started from the south lateral drift 55 feet south from the station is extended 85 feet, having been advanced 20 feet during the week. No. 1 west crosscut is advanced 45 feet. This crosscut continues in quartz giving low assays. No. 2 east crosscut started 60 feet north of the 1400 level station was extended 15 feet, making its total length 100 feet. No. 3 east crosscut is advanced 40 feet. In the south lateral drift at a point 75 feet south of No. 2 west crosscut we have started No. 4 east crosscut and advanced the same 10 feet. All these crosscuts are passing through favorable looking vein material, but disclose nothing yet of practical value. We are repairing the main incline below the station on the 1400 and are putting waste and ore chutes below the station for this level.

SIERRA NEVADA.—650 level: The northwest drift has been extended 36 feet; total length, 557 feet; formation, porphyry.

OCCIDENTAL.—At a point in No. 3 upraise 40 feet below the track floor of the 450 level, have started a south lateral drift in ore of good quality. The south drift from the bottom of No. 5 winze is showing some quartz with bunches of fair ore.

CHOLLAR.—Winze 80 feet south of north line, 750 level, is down 80 feet, bottom in clay, quartz and porphyry. Are opening a station in the main incline on the 1100 level. Sent to mill the past week 550 tons of ore, the value of which averaged \$18.42 a ton, as per battery samples.

POTOSI.—East crosscut from winze, 930 level, is out 78 feet in porphyry streaked with quartz. East crosscut 350 feet south of Chollar incline, 1230 level, is out 157 feet; face in porphyry and streaks of quartz. South lateral drift, 1300 level, is out 667 feet; face in clay and porphyry.

WARD COMBINATION.—East drift from the 1800 station is out 825 feet; formation clay and porphyry.

ALPHA & EXCHEQUER.—No work done the past week on account of repairs to shaft.

SILVER HILL.—Are opening out the 50 level.

UTAH.—On the 725 level the northwest lateral drift from the main west drift from the shaft has been extended 10 feet; total length, 428 feet. West crosscut No. 2, 150 feet northwesterly from west crosscut No. 1, has been extended 40 feet, total length, 75 feet, passing through vein porphyry, clay and fine lines of quartz. Face of crosscut is in west country formation.

ANDES.—During the past week north drift, 420 level, was advanced 15 feet in a formation of quartz and porphyry. Work in east crosscut has been suspended for the present. Have cleared out and timbered north winze from 350 level and started sinking the winze to connect with the main north drift on 420 level.

GOULD & CURRY.—200 level: Winze No. 1 has been sunk 8 feet; total, 14 feet. We have extracted from this level during the week 35 cars of ore of fair quality. 250 level: South drift from upraise No. 1 has been extended 31 feet, passing through quartz and porphyry. West crosscut No. 1 from upraise has been advanced 30 feet through quartz and porphyry; total length, 80 feet. 300 level: Incline upraise No. 1 has been carried up 23 feet; total, 120 feet. Face in porphyry and bunches of quartz.

BEST & BELCHER.—1200 level: West crosscut No. 1 has been advanced 17 feet through porphyry, clay and bunches of quartz; total length, 125 feet.

Potosi District.

RICHMOND.—*Silver State*, Feb. 20: Wm. Farrell, of the Richmond mine, Potosi District, Osorno Range, paid our office a visit this morning. He reports the mine looking exceedingly well, with plenty of average grade ore in sight.

COLORADO.

HIGH GRADE ORES.—*Denver News*, Feb. 19: The mine-owners are confronted with a very complex and serious question at present, involving the disposition of their high grade ores. It must not be assumed that the ore cannot be sold, but all sales made for a long time were at a sacrifice. In truth the smelters don't want the ore that runs from \$75 to \$500 per ton, and it would make the face of a smelter-owner turn white to speak of selling him ore that is worth \$500 to \$75,000 a ton. There is not a little of this ore being mined in Colorado to-day and nine-tenths of it is to-day stored in the ore-houses. This is especially true of the mines in the Silverton and Ouray district. There is so much fluctuation in the price of silver and so much danger of loss in the treatment of high grade ores that the smelters in many cases will not bid on them, except at such figures as the mine-owners would not listen to. They remember the two carloads of Yankee Boy ore, worth \$40,000 each, that stood on the sidetrack in the switch yards for weeks before any one would dare to bid. The sale of such ores is now causing the mining men no little worry. The prospects of free coinage appear very blue and it begins to look, unless the measure passes, there will be no relief for the miners, and some of the mines will have to close.

ASPEN NOTES.—*Times*, Feb. 21: Carl Wulstien has

leased the Rip Van Winkle on Richmond hill, adjoining the Phoenix, just south of Queen's gulch. B. Clark Wheeler has sold his interest in the lease and bond on the Gen mine to Mrs. Cora E. Russell, who is the pioneer woman of Pitkin county. The lease runs until July 14, 1892. Cora E. Russell has sold her 1-16th interest in the lease and bond on the Wilmington, Picnic and Idlewild of the Climax group to B. Clark Wheeler. Toney Nugent has a sixteenth and Wheeler the balance. Nugent is superintendent and head drill pumper with three helpers, at a salary of \$100. Wheeler is manager and paymaster with a salary of \$75. John Thorne is pushing work on the Austin lease. Two men are employed on the Aspen Con. tunnel. Supt. Besser of the Highland Chief M. Co. reports that he has caught the contact on the Lackawanna Boy, and that the ore is rapidly improving on the Chief; 40-ounce assays are obtained. The company is preparing to patent its Pyramid claim.

LEADVILLE MINES.—Cor. *Denver News*, Feb. 19: The mining industry in this section has shown marked activity during the past few weeks. The Moyer started up last Friday, running two shifts, with a force of about 140 men. This property is a regular shipper, and is producing some good ore. William S. Patrick is shipping some first-class ore from the Slipper Rock hill. The shipments will aggregate nearly 100 tons per month. Prospect work on the Manning lease is progressing favorably. The returns are very encouraging. The McGarey lease on the Oro City is shipping regularly. The ore is improving in quality and quantity. After a long siege of prospect work a small streak of rich ore was encountered last week at the Satellite. The streak is being followed, but as yet has shown no signs of widening. A large body of ore was recently struck in an upraise at the La Plata on Rock hill. An old winze has been timbered, down which the ore will be lowered and taken to the surface, through the old La Plata shaft. This property, until recently, has failed to pay expenses, but under the management of Philip Aragall is rapidly coming to the front. The Redhead, adjoining the La Plata and under the same management, is shipping about 25 tons of good lead ore per day. The Blind Tom lease is producing some very rich ore, which is being sacked and placed in ore sheds. This property is now working two shifts, and will begin shipping in a few days. Leadville parties interested in mining property near Granite returned from there last night and report a curious state of affairs existing at the Mayflower. The property is being worked by Denver parties under bond. Six men are employed underground to each shift. The shaft is down about 110 feet. Drifts in either direction are being run in on a fine streak of rich gold ore, which is sorted and sacked. Were this property backed by the requisite amount of brains and capital it would undoubtedly prove to be one of the most valuable of recent gold discoveries in this section. The Dunkin No. 2 is shipping regularly a large amount of low-grade iron ore. Some fine ore is being taken out at the Foster lease on the Dome. Prospect work is progressing rapidly, and the returns are very favorable. Mr. M. Hurly, working the Baby shaft in the Stone, under a lease, is shipping regularly. Connections will be made with the Baby and another shaft farther down the hill in a few days in order to facilitate the hoisting of ore. Considerable deadwork is going on at the Big Chief in clearing away the debris of the fire in that property some time ago. The Elk is shipping something over 100 tons of ore regularly. The bodies from which this is taken seem to be almost inexhaustible.

DAKOTA.

D. & D. SMELTER.—*Deadwood Pioneer*, Feb. 21: The work on the new smelter will hereafter be pushed with the utmost vigor. The death of Mr. Miller left Prof. Carpenter somewhat doubtful of the company's intentions, but on Messrs. Swift's arrival they directed him to proceed with the work as rapidly as possible. One-half of the smelter, of 125 tons capacity is expected to be completed by June 1, and the other 125-ton building will be added before the first of next year. The machinery was to have been shipped on the 20th of this month, but the building was not far enough advanced to receive it, and Prof. Carpenter ordered the shipment postponed for a few weeks.

ANOTHER TIN-MILL.—Col. O. O. Taylor, of St. Paul, who has acquired title to a number of valuable Nigger Hill tin claims, has decided to erect a mill and concentrator, and has already purchased a portion and contracted for the remainder. The colonel also owns a millsite, with water right and plenty of good timber. He has had considerable experience in tin-mines and has no hesitation in saying that the Nigger Hill claims are the richest he ever saw in any country. This enterprise will be watched with a deep interest and its success will lead to the establishment of other and larger works.

TORNADO.—Shipments of ore are being daily made from the Tornado, at Ruby, and the mine is looking splendid.

MARK TWAIN.—This property is at the head of Nevada gulch, and is owned by E. May, of Lead. Recent developments on the property have uncovered a large body of ore that will pay to ship, and shipments are now being made to Omaha.

KROJAN.—The ore in this mine is of a high grade, and a large body is in sight. Shipments are now being made, and the quantity is only limited by the railroad facilities.

IDAHO.

TRADE DOLLAR.—*Idaho Avalanche*, Feb. 20: The tunnel No. 2 on the Trade Dollar is still progressing favorably and in rich ore. The ledge at the present face is 18 inches wide and rich, yielding considerable fine specimen ore. The face of the tunnel is still 235 feet away from the winze which it is running to meet. When they are connected the ground will be in fine shape for stopping the rich chimney cut in tunnel No. 1. The Idaho Pittsburg Company is now stopping out ore on the ledge on which it has been drifting and has again started the Rand drill on the face of the crosscut tunnel which will be pushed farther into the mountain with the expectation of cutting other ledges. The pay streak in the ledge where the stopping is being done is about ten inches wide with 600 feet of backs, all virgin ground above.

THE DE LAMAR DEAL.—*Idaho Avalanche*, Feb. 21: The contract for the sale of an interest in the

De Lamar property being now a matter of record, *Avalanche* is prepared to give its readers a correct synopsis of the terms and conditions of the biggest deal made in Idaho mining property for a long time past. Told as briefly as practicable, the contract is as follows: Captain De Lamar turns over his entire property, consisting of all his mining claims, mill, millsite, water rights, ore on hand and not in transit on day of transfer, all buildings, timbers and supplies on hand May 14, 1891, to the promoters of an English stock company, the transfer to be made on the 14th day of May, at a nominal price of \$2,000,000, in consideration of which the buyers agree to pay him not less than \$500,000 or more than \$750,000 in cash for their interest and to stock the mine in Great Britain at \$2,500,000, \$400,000 working capital. Of this \$400,000 working capital, \$250,000 is to be paid in cash by the promoters and the balance, \$150,000, in stock subscriptions at par value. Then Captain De Lamar is to receive balance of amount to be paid him in stock at cost value sufficient to make his total payments \$1,750,000. But by paying Captain De Lamar \$10,000 within 30 days from date of contract, the promoters have the privilege of fixing the capital stock at only \$2,000,000 and the working capital at \$225,000, in which event \$175,000 must be paid into the treasury in cash and the balance of \$50,000 raised from stock subscriptions. De Lamar still receiving the same amounts in cash and the same amount in stock at cost as in the first-named proposition. Either of the above propositions boiled down means that the promoters purchase at the rate of \$2,000,000 for the whole, either one-fourth or three-eighths of the property, Captain De Lamar still retaining the larger interest and control and receiving either \$500,000 or \$750,000 in cash, according to whichever proposition the promoters may choose to take. The contract is signed by Henry Bratenober of Helena, Montana, for the purchasers, and we are informed that the English capitalists investing are the same who brought out the Elkhorn mine of Montana, in London, the stock of which is now 75 per cent above par. It is understood that the English capitalists interested in this deal propose to take all the stock not going to De Lamar, themselves, and that it will not be put on the market at par.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Feb. 19: The Indian mine is being developed faster than any mine in Alamo. The Burleigh steam drill is the cause of this. Shots are touched off continually, sometimes as many as eight a day. This means a great activity. The Ushes mine is going ahead pretty lively, sinking. Water is plentiful, but not enough to stop work. The Aurora is being worked night and day, sinking and drifting. The body of ore has come in in both places, and some of it richer than ever. D. W. Church is foreman of the El Paso and work is progressing very favorably on the mine. The Gold Tree mine has been opened by the Princess Co. and fine ore is in sight. The mine is being pumped out. The San David is almost ready to begin active work.

MONTANA.

SHONBAR.—*Butte Miner*, Feb. 19: Developments in the Shonbar company's ground, which lies just south of the city and adjoins the Bannister ground on the east, are progressing rapidly and are exposing some fine ore. This ore will assay from 300 to 1000 ounces in silver, from one to three ounces in gold per ton, and from two to five per cent copper. The property is at present looking remarkably well and will no doubt become a rival in production to the great Vulcan or Bannister, adjoining it on the west.

BANNISTER.—With reference to the Bannister, the company declared on Wednesday, the 11th, its sixth dividend of \$6000, payable on the 25th at the office of the company at Helena, making \$36,000 paid since last August. The workings of the mine are looking fine and the ore bodies promise as large returns in future as they have in the past.

THE BI-METALLIC.—*Phillipsburg Mail*, Feb. 19: During the past few days the Bi-Metallic company have been contemplating putting on a large force of men, excavating for the additional 50 stamps which they are to erect alongside of the present mill, but the disagreeable weather has so far prevented them from beginning operations. This addition to the milling capacity will mean the employment of a larger number of men at the mine and mill, to say nothing of those who will be required in its construction. Of course this is an assurance of greater prosperity for Flint Creek district, and means a great deal to Phillipsburg. Certainly not less than 50 or 60 hands will be steadily employed in operating the new mill, furnishing fuel, etc., and in a short time the Bi-Metallic will be a marvel in its productive and dividend-paying qualifications.

A BIG DEAL.—*Butte Miner*, Feb. 12: The big mining deal which has been pending in the city during the last month, mention of which has been made exclusively by the *Miner* on several occasions, assumed formidable shape yesterday, and the transfer is now as good as consummated. The mines to change ownership are the Amy and Silversmith, owned by a company and located just northwest of the Moulton; the Goldsmith, owned by George Tong exclusively; the Millside, owned by Frank Carey et al.; Little Annie, owned by Clayton Ramsdell of Deer Lodge; Tully, owned by John Connell and D. J. Hennessy; Sooner, owned by E. A. Nichols and Charles S. Warren, and the Silver Safe, owned by Patsy Clark and others. All of these claims are situated northwest of the Moulton, and have long been considered among the best silver-producers in the camp. The purchasers are an English syndicate represented by A. E. Barton of this city and the price agreed upon is \$800,000 in cash. The deeds for the transfer of the property have all been made out in the name of Frank P. Carey, signed by the claim-owners and placed in escrow in the First National bank, where they will remain until the money is paid, which will be inside of 90 days. The syndicate has already examined the property thoroughly and is perfectly satisfied with it, but Captain Plummer of the Elkhorn Co. will arrive in a few days to make another examination. It is the intention of the syndicate to put in additional machinery and sink four shafts for the thorough development of the property, which, when opened up, cannot fail to prove a bonanza to the syndicate and of inestimable benefit to Walkerville

and Butte. The purchase gives the company 9000 contiguous feet along one of the best silver veins in the camp, which is ample room to work the ground on an extensive scale and extract therefrom millions of dollars. In the past the Amy and Silversmith has produced a vast amount of silver and gold, the dividends alone being \$249,000. It is developed to a depth of 500 feet, and up to a short time ago was under lease to several Butte men, who worked it at a profit until fire destroyed the hoisting works. The Goldsmith is also a heavy producer, is developed to a depth of 400 feet, and for years has been worked continuously by its owner, George Tong. The other properties have not been developed to any great extent, but they are known to be good and with a little work will become paying propositions of no small proportions. As soon as the money is paid over the work of improvement will be commenced and prosecuted with vigor, and in addition to the large number of men now employed in and about the camp, hundreds more will find work through the enterprise of the company. In connection with this sale it is said that the syndicate is casing about for a suitable site on which to erect a mill and smelter for the reduction of its ores, and that Butte will be the favored spot.

NEW MEXICO.

PIÑOS ALTOS.—*Silver City Enterprise*, Feb. 20: The Aztec Co., of Pinos Altos last week let a contract to Messrs. Guthrie and Herson, two experienced miners, to run a tunnel 600 feet starting from the Aztec camp and designed to cut the Kleptomaniac lode at a depth of 470 feet. Work was started on Wednesday the 11th ultimo and will be prosecuted vigorously. Two shifts are at work, and the force will be increased as requirements may demand. When completed, ore will be brought from the tunnel instead of through the shafts, making a great saving on cost of extraction. The company will have great reserve of ore above the tunnel level, and with less cost in mining and transportation to the mill ought soon to pay dividends. Frank Bissbee has a carload of rich ore ready for shipment from the Mosarch mine at Lone Mountain. It is expected that the ore will run 250 ounces in silver per ton. W. H. Newcomb is shipping five cars of iron ore per week to Socorro. Troutman and Smith are shipping 50 cars of iron ore per month to El Paso. The ore is being taken from the Newcomb claims by an arrangement between the two parties. The Silver Mining company of Lake Valley last Friday paid a dividend of 10 per cent on the capital stock of the company. If we remember rightly this is the third dividend in 12 months. A big strike was made in the Mammoth mine on last Friday morning, in the bottom of the shaft at a depth of 220 feet. The rich ore when first struck was 18 inches in width but has since spread to two feet. From general appearances the ore will pay handsomely to ship to the smelter without concentration.

CONCENTRATOR.—*Chloride Black Range*, Feb. 21: Supt. H. W. Russell of the Silver Monument mine has received instructions to go ahead with the construction of a concentrator for the mine. The erection of the mill will be commenced as soon as lumber can be procured. The wagon-road from the mill has been completed, ore-bauling to the mill commenced to-day, and all that prevents the starting of the mill is the cold weather. Last week a streak of ore, one foot wide was struck in the shaft of the U. S. Treasury mine that gave returns of 37 ounces gold and 255 ounces silver to the ton. The shaft is down 125 feet, everything hoisted from it is sacked for shipment, and the rich vein of ore above mentioned increases in dimensions as depth is gained. The new Blake crusher for the Chloride M. and Reduction Co.'s mill arrived last Saturday, has been placed in position ready for business, and will be set in motion just as soon as the weather moderates sufficiently to allow the mill to start up. The crusher is an excellent piece of machinery and has a capacity of 60 tons every 24 hours. The ore dumps of the St. Cloud group of mines are overcrowded with many hundreds of tons of ore, and there are also vast quantities of ore in sight in the mines. Those who some months ago wondered where the ore was coming from to supply a 50-ton concentrator will soon be wondering where all the ore does come from.

OREGON.

MINERAL.—Cor. *Bedrock Democrat*, Feb. 20: Snow has fallen quite a depth in the camp and snow-shoes are in demand. Mineralites are in the best of spirits and the camp looks well. The Black Maria is working about ten men at present. Messrs. Noble, Kertoff and Murray are driving a 400-foot tunnel to tap the Little Chief. M. Duffy is working a small force on the Black Hawk. There are three men at work on the Transit, a valuable property owned by Wing & Sommer. The Transit is a two-foot vein and gives an average assay of 140 ounces in silver to the ton. With the opening of spring development work on hundreds of locations will be vigorously prosecuted and the camp will present a lively appearance.

UTAH.

THE TINTIC SALE.—*Salt Lake Tribune*, Feb. 19: Yesterday the *Tribune* told of the taking up of the bond on the Cleveland and Lancaster mines, Tintic. It is understood the price paid by Captain Ryan & Co. was some \$2000. These claims are about one-half mile from Silver City, on the trail from that town to Mammoth.

GOOD FROM DEEP CREEK.—The *Tribune* is in receipt of a letter from the Deep Creek country. The writer says there is more mineral around Deep Creek in a radius of 50 miles than in any other farming valley in the United States, and which will average proportionately of high grade. Then there are thousands of acres of as fine soil as lays out doors, and which will all be tilled in the course of a few years.

COPPER FROM BINGHAM.—McVicker had in hand a fine sample of copper ore from a claim owned by Jack McNally, and which will run about 30 per cent copper. As the assay was not completed, the amount of other metals was not known. This claim is on main Bingham near the old Hazelgrove mill above the town, and the ore was pronounced by McVicker as being very good.

A SMELTER.—*Salt Lake Tribune*, Feb. 10: P.

A. H. Franklin is authority for the statement that in all probability a foreign syndicate of capitalists will erect a smelter in this city which will cost \$1,000,000. An expert representative from Europe is now en route here for the purpose of looking over the grounds. The institution will have a capacity of 2000 tons of ore per day, and will be such as to handle and take care of everything that may come here. All processes will be used and the necessity of Utah, Montana, Idaho and Nevada ores being shipped to Denver and Omaha will be obviated. The new corporation has learned of the projected line to Deep Creek, and the building of that road, or the assurance that it will be built, will influence them to a greater or lesser extent.

BONANZA FLAT.—*Park Record*, Feb. 21: The section of country known as Bonanza Flat is going to be more active next summer than ever before. The sale of the Pioneer group is a wedge that will split wide open the popular fallacy which seems to possess the Salt Lake papers, hotel men and citizens in general, that all the rich ground on the great mineral belt is owned by the Ontario, Daly and Anchor companies. For years the story went—and it was firmly believed—that the Ontario and Daly embraced the entire vein; but the discovery and rich developments in the Anchor exploded the theory, and it was at once assumed that such an immense body of ore could not be very extensive and must stop within the Anchor lines. It does not seem to enter the heads of these people that the Ontario, Daly and Anchor are composed of more than one vein, and that while those properties are near the center, the mineral zone extends over into the Cottonwoods, with a width of not less than two miles. Its course is nearly east and west, which gives Bonanza Flat four or five rich veins. All that is needed to demonstrate this fact is a few thousand dollars expended on the ground of Smith Ehenger, Farish & McLaughlin's West Ontario, H. Hirschman's Black Diamond and Nimrod, the Dolberg group or the Kennedy group. This ground is all patented and each group has enough developments to show that each is a big mine in itself. The great trouble is there has been a desperate attempt made by the big companies for years to corral that whole section of country, but the prospectors have been too much for them and are still holding on. Once outside capital makes a big strike, the whole matter will change. The ore is there; the ground is there; it is patented and can be obtained on reasonable terms. The entering wedge is the Pioneer group, and in a few years' time it will make Bonanza Flat as active as Ontario Hill is to-day.

THE NORTH END TINTIC.—*Salt Lake Tribune*, Feb. 22: The North End group at Eureka, Tintic, is looming up in good shape since the strike reported in the Yorkville tunnel last week. Johnny Davis has struck some fine ore still farther north after sinking only six feet. Specimens of it will run 60 ounces. Mining men look for great developments in the North End this coming season.

ORE IN THE GLENCOE.—Supt. Curtis of the Glencoe mine received a telephonic message from Park City yesterday saying that there was three feet of ore in the face of the drift, and the mine is improving, and hence promising to become a big property.

MAAMTOO SWITCH MILL.—Truman Schenck goes to Tintic to-day to commence work on the sampling-mill to be erected near the Mammoth switch. Now that the location is agreed upon, the building and machinery will soon be in position and the works running.

WASHINGTON.

WHERE MINING IS DONE.—*Seattle Press-Times*, Feb. 11: There are eight counties in Washington in which mining operations are carried on to greater or less extent. They are as follows: King, Kittitas, Skagit, Snohomish, Stephens, Okanogan, Pierce and Lewis. To these might be added Whatcom, which is again assuming importance as a coal-producer. In six of the counties above named—King, Kittitas, Skagit, Snohomish, Stephens and Okanogan—precious metals exist, and mines of gold, silver, copper and lead are being opened up on an extensive scale. The government reports up to within the past year have merely mentioned Washington as a mineral-producing section, and have credited it with the production of \$100,000 in gold taken from the placer mines, but silver seems to have had no place on the records. The opening of the mines for precious metals may properly date from the year 1891, and the outlook for this year is very flattering.

KITTITAS DEVELOPMENT.—The Ellensburg Improvement Co., having received subscriptions to the amount of \$200,000, are erecting a small blast furnace for the purpose of testing the iron ores of Kittitas county. This furnace is to be followed by one of larger capacity, together with rolling-mills, nail and bolt works, car works and other iron manufacturing. The citizens of this enterprising place have not waited for outside capital to aid them in this important work, but have taken hold with a degree of energy that is certainly commendable. They say Ellensburg is surrounded by an iron country more extended than that surrounding Birmingham, and there is nothing to prevent it becoming a city of 25,000 or 30,000, and one of the greatest iron centers in the United States. They hope to have their first furnace in operation in about 60 days.

AROUND SPOKANE FALLS.—*Northwest Tribune*, Feb. 21: The Blue Bird mine on Blacktail mountain, in the Pend d'Oreille district, is assaying 400 ounces of silver to the ton. The Webber claim, in the same district, is making a fine showing. Pigment has been found in large quantities in Horse canyon, near Ellensburg, and a company has been organized for the purpose of manufacturing it into paint. One of the largest iron discoveries ever made in the Northwest is in the Iron Mountain district, Kittitas county. It is a veritable mountain of iron ore; thousands of tons of iron can be taken out with little trouble and expense. A. D. Wheeler, on his return to Kootenai Lake, B. C., will begin extensive operations on the Kootenai Chief mine, property of the Ainsworths. This mine is the south extension of the famous Blue Belle, and is considered equally as extensive and valuable. It is now established beyond doubt that the Morning mine will change hands. The only delay there will be, if any, will be the time required for a satisfactory distribution of the shares of the property among the individual members of the purchasing syndicate, and for the adjustment of the minor details of the deal.

MECHANICAL PROGRESS

The Evolution of Machinery.

Although the Societe Cockerill was established by an Englishman, with English methods, it is now in many respects different from the English works. It is an example of what can be developed within an immense works without going outside to find out what other people are doing. As in the Darwinian theory, the evolution of animals depends upon the environment, so upon the environment depends the evolution of machinery. The environment in America is an intoxicating atmosphere to begin with, a temperament in the people which leads them to ransack the world for the best things and the most modern, high wages tending to cause the substitution of brains for muscle and machinery for both, and high interest tending to economy of capital.

In Belgium we have the exact opposite. A more sedative climate, a conservative temperament, a love of home products, and a disinclination to travel, low wages and low interest. The result is, in America, machinery is built light, cheap and for high speeds. It is not built with an especial view to lasting a lifetime, because it is known that long before it is worn out it is useless in a workshop, because there have been built other machines which are so much better that it pays to throw it out. In Belgium, machinery is heavy, expensive and moves slowly.

For instance, in America we long ago learned that the blast-furnace blowing engine, erected about 12 or 15 years ago by the Thomas Iron Co., at a cost great enough to have built a good-sized complete furnace plant, was, although a good engine, an engineering monstrosity, and we now favor the engines of Mackintosh, Hemphill & Co., and the Weimer Machine Co., which are much cheaper for the same amount of blast. But in Belgium I saw a new blowing engine being built for a blast furnace in France, which, I think, is a greater monstrosity than the old one in Hokenandqua. It has more cast iron in it, and I think occupies about double the ground area which I saw (about three years ago) occupied by an old horizontal slow-speed engine at the Eliza furnaces (Laughlin & Co.) in Pittsburgh. If that Belgian engine was in Pittsburgh the money it would bring as scrap iron would probably build a Hemphill engine to do the same work. Another example of the evolution under this environment is the greater use of human labor as compared with horse or machine power. The women drawing the little carts of coal instead of horses, locomotives, or wire-rope traction, for instance. Also, hand riveting is still exclusively used in boiler work instead of machine riveting.—*Ex.*

Shot and Burnt Iron.

This is a class of iron that foundrymen dislike to have anything to do with, on account of its mixing in and contaminating other irons. Shot iron will sometimes cause hard spots in casting; it also causes them to crack, and very often 500 or 600 would make a 6000 heat of soft iron so hard that half of the castings would be condemned. Shops that can use nothing but very soft iron in their castings generally have trouble to get rid of shot iron; there are some shops that will not bother with it at all; they will pick out all the iron they can from the cinder and let the rest go, and it has been a question whether they were not as well off as those who paid help to screen the cinders, and use the shot iron at the expense of making bad castings. Molders have tried in many ways to use shot iron so as not to spoil good soft iron, and about the best plan is to make a separate heat of it, or melt it at the last of a heat for coarse work, or pour it into "pigs," which can then be used to mix in with good pigs in future heats; but in any form it should be used with caution. Burnt iron, in some respects, is like shot iron, so far as making bad work is concerned. Burnt iron makes more slag than any other iron and causes a cupola to choke quicker. There are degrees in burnt iron; some are worse to deal with than others, but with shot iron it is all about alike. Burnt iron should be used in small quantities only at a time, unless a lot of sash weights are to be made; then a heat can be made of nothing but burnt iron, and the cupola run until the ladles and cupola are all choked, if one desires to do so. In melting ordinary mixtures of iron, such as that used for common castings, there is seldom trouble caused from the different kinds of scrap or pig not giving the quality wanted, when shot or burnt iron is left out, and the meter charges the iron and fuel as it should be done.—*Glasgow Engineer.*

THE TESTING OF IRON AND STEEL.—If a fracture of iron gives long, silky fibers of a leaden hue, the fibers cohering and twisting together before breaking, it may be considered a tough, soft iron. A medium, even grain mixed with fibers is a good sign. A short, blackish fiber indicates badly refined iron. A very fine grain denotes a hard, steely iron, apt to be cold-short and hard to work with the file. Coarse grain with brilliant crystallized fracture and yellow or brown spots, denotes a brittle iron, cold-short, working easily when heated. This iron welds easily. Cracks on the edges of bars are a sign of hot-short iron. Good iron is readily heated soft under the hammer, and throws

out but few sparks. Nitric acid will produce a black spot on steel; the darker the spot the harder the steel. Iron, on the contrary, remains bright if touched with nitric acid. Good steel in its soft state has a curved fracture and a uniform gray luster; in its hard state, a dull, silvery, uniform white. Cracks, threads, or sparkling particles denote bad quality. Good steel will not bear a white heat without falling to pieces, and will crumble under the hammer at a bright red heat; while at a middling heat it may be drawn out under the hammer to a fine point.—*Glasgow Enquirer.*

On the Crystallization of Iron.

At a recent meeting of the South Staffordshire Institute of Iron and Steel Works' Managers, held at Dudley, Mr. Thomas Morris, F. G. S., of Warrington, contributed a paper on "The Crystallization of Iron," in the course of which he said that the term crystallization, when applied to iron, was generally used to signify that the structure or composition of the iron had assumed a new form while it had been in use. Accepting that postulate, and proceeding therefrom, he said that during his time—over 46 years—at the puddling furnace, inventive geniuses by the score had come forward to assist the puddler to produce fibrous iron and discover reasons for crystallization occurring as it did, in the first or new-born stage of wrought or puddled iron, and in all its subsequent workings into the merchant iron of commerce. His experience was that, with one or two exceptions, merchant iron, when work was commenced upon it, either by forging, or smithing, or turning, or planing, or bending, did not, when it left those workmen, contain the same virtue as regards being fibrous as it did when they first took hold of it.

Engineers and others, ever since Cort invented the puddling process and iron came into general use, had held ideas that all iron work, when doing duty, was subject to singular and important changes in its structure, and became crystallized, assigning various reasons, such as vibration, heat, percussion, magnetism, frost or extreme cold, etc. The civil engineers 50 years ago held very diverse views on the subject—some that crystallization was greatest in those parts of an axle where the vibration was greatest; others, in those parts of machinery where concussion was most severe, and others, at those parts where, in the course of manufacturing process, the hammering or forging was heaviest.

His own belief was that the change in the nature of iron was due to (1) the effect of oxygen during the puddling process and overheating in subsequent workings; (2) compression, and (3) puddled iron produced from ores containing a large percentage of silica. Dealing with the first cause, he said that when iron during the puddling process is coming to the nature of wrought iron, it is extremely sensitive, and his opinion was that by overheating when in this state, an excess of oxygen is obtained, which is the principal cause of the iron subsequently becoming crystalline. Compression is a prolific cause of this granulation or crystallization. This is especially observable in chains passing over a pulley, giving it a sort of hammer hardening, which tends to convert fiber into grain. The primary cause of crystallization is the excess of silicious ores or from "cinder pig," from which merchant iron is produced.

It is impossible to produce the same quantity of iron from silicious ores, or cinder, as is produced from the hematite ores, as it was for the old alchemists to find the stone they dreamed of which was to convert all base metals into gold. Hence, for the consumer of iron to expect the same quality from different districts is a mistake, unless the native ore is discarded by the pig maker and others imported. Nearly all iron manufacturing districts have their own specialties, and the manufacturer, by judiciously mixing the pigs for the puddling process, and by good puddling, attains for his purpose, and produces for his customer, the suitable common crown iron of commerce.

In process of time, that very iron becomes so much scrap, and is bought up for working into shafts and other uses and forgings; but what fibers were developed in the first and second workings by the ironmaster, are lost in its third working, and become crystalline, and if breakage should occur, it would invariably take place in that part of the forgery where such scrap had located itself, not because it had become crystallized through vibration while doing duty, but because it was so at the commencement.

It was through this rather unreliable material that the necessity of high-class crank and other shaft manufacturers starting to build up their forgings with fresh, reliable iron, arose. Formerly, the extra cost of the latter deterred the erecting engineer from ordering it, and at times the unscrupulous maker from using it for temporary gain; and in case of breakdown of their work, their pet "vibration" had to bear upon its broad shoulders the stripes those sinners were so justly entitled to.—*Western Machinist.*

JOHN RICHARDS, president of the Technical Society of the Pacific Coast, read a paper at the last monthly meeting on "Abrasive Cutting in the Mechanical Arts."

To DRILL a three-fourths inch hole through Bessemer steel at the rate of one-fourth inch per minute requires one-fifth horse-power.

SCIENTIFIC PROGRESS.

The Artificial Production of Rain.

The question as to whether rain can be produced by artificial means is to be tested by the United States Government. On the motion of Senator C. B. Farwell, of Illinois, a clause was added to the Appropriation Bill, which provides that, under direction of the Forestry Division of the Department of Agriculture, \$2000 shall be expended in experiments having for their object the artificial production of rainfall by the explosion of dynamite. But Senator Farwell does not intend to limit himself to this small sum, and will, if necessary, contribute from his own pocket such sum as may be necessary to complete the trial to his satisfaction.

In a communication from Senator Farwell the following theories are advanced: "My theory in regard to producing rain by explosives is based partly upon the fact that after all the great battles fought during the century, heavy rainfalls have occurred. This is historical and undoubted. Senator Stanford, one of the builders of the Central Pacific Railway, informed me lately that he was compelled to do a great deal of blasting through a part of the country where rain had never been known to fall in any useful quantities, and where it has never rained since, and that during the period of the blasting, which was nearly a year, it rained every day. I feel almost convinced that rain can be produced in this way. The dynamite could be exploded on the ground or up in the air, and I think I would prefer the latter. The experiment should be made in eastern Iowa, Colorado, or in western Kansas, somewhere along the railway, and my own idea would be to commence early in the morning and explode continuously for seven or eight hours."

While this scheme does not give a very great promise of success, it would be interesting to see the experiment tried and even partial success would be of great value. If the farmers of Colorado and western Kansas could get a shower once a week by sending up torpedoes every day, the result would be well worth the trouble, and there is plenty of reason to suppose that such artificial showers, by fostering the growth of vegetation, would in time produce the conditions which lead to regular natural showers, and the consequent permanent establishment of fertility throughout the region to which the process is to be applied.

The Modern View of Electric Currents.

The electrician who knows the theoretical part of his science only as he studied it five or ten years ago, finds his knowledge sadly at fault when he is confronted with the theories and ideas of to-day. Not that any great and radical changes have revolutionized electrical theory in these last few years, but there have been great additions to our knowledge of certain occult phenomena, and theory has advanced correspondingly. We were accustomed to look at the electric current as something that flowed in or along a wire, and too many students grew to think of it almost as a fluid. To those who depend slavishly on the set theories it is rather a rude shock to realize that in very many cases we should pay far less attention to electrical disturbances in the conductor than to the extraordinary pulsations of energy that surround it. We must to-day think of a wire carrying a current not as a tube in which a certain mysterious flow is taking place, but as a mere linear nucleus along and around which there is a ceaseless flow of energy capable of producing tremendous effects even far away from the wire. We must think of the conductor not as a thin line of wire, but as the center of a far-reaching electro-dynamic disturbance. To take an extreme case, an alternating current of very short period, capable of producing enormous inductive effects and transferring immense mechanical power, might penetrate the accompanying conductor hardly more than skin deep. What would go on within the wire we might almost neglect—it would be only as we neared and passed its surface that electrical energy would manifest itself. And further, it is a surprise to realize that electro-magnetic induction has suddenly fallen into line with other forms of radiant energy—that the light and warmth of a summer's sun differ from the solar waves of induction that produce magnetic storms only in degree—that a gas flame is just as truly an exhibition of electro-magnetic energy as an electric light. But all this, which may sound so revolutionary, is not new; it has gradually been unfolded during fifteen years of splendid theoretical investigation, and has waited, as the law of gravitation waited more than two centuries ago, for the connecting link of experiment to bind firmly together brilliant hypothesis and reconcrete mathematics.—*Electrical World.*

PHOSPHORESCENT CENTIPEDES.—That there are luminous Myriapods has been known for many years, as also the fact that they occur only among the family *Geophilidae* of the Chilopod Myriapoda. Both sexes are luminous, sometimes quite intensely so, and the luminescence spreads out over the whole ventral surface of the animal. If one of these *Geophilids* is taken up, the luminous matter communicates to the hand of the observer or to anything else with which the specimen comes in contact. There is considerable dispute regarding the origin of this phosphorescent matter. Accord-

ing to Dr. R. Dahols, it is contained in the epithelial cell of the digestive tube, and the emission of the light depends on the molting of the digestive tube. Mr. Macoe, on the contrary, contends that the luminous matter is a glandular excretion, and that these glands (*glandes preanales*) are situated on the last two segments of the animal. Mr. J. Gazagnaire has satisfied himself that the luminous matter is secreted from glands situated on the sternal and episternal plates. Upon pressure these glands secrete a yellowish, viscous substance, having a peculiar odor and which is highly phosphorescent. In a more recent article (*Mem. de la Soc. Zool. de France*, v. iii, 1890), Mr. Gazagnaire reviews all previous observations on luminous *Geophilids*, and finds that, so far as the European fauna is concerned, luminous specimens were found only between the end of September and beginning of November. The luminescence appears, therefore, only at a certain epoch in the life history of these Myriapods. Further, in all more carefully recorded cases, luminous specimens were never found singly, but always in pairs or in companies of three or more specimens. The few and fragmentary observations that have hitherto been made on the mode of reproduction in these animals seem to prove that the fecundation of the female takes place in autumn, or just at the time when the luminous specimens are found, and Mr. Gazagnaire is thus fully justified in connecting the appearance of luminescence with the excitement caused by sexual instinct. In Algiers, Mr. Gazagnaire observed luminous specimens of *Orya barbarica* in the month of April, and he concludes that in other countries and in consequence of altered climatic conditions the period of luminescence probably differs from that observed in Europe.—*Insect Life.*

KNOTS IN DIAMONDS.—In cutting a diamond sometimes a knot is discovered. These are little substances as much harder than the diamond itself as you can imagine. They are to the stone, the same as a knot in a pine board. When a diamond with these characteristics is discovered it has the same effect on the polisher that the striking of a nail has upon a carpenter when sawing a board. It takes months and months to polish knotty stones, and I have known a year's work to be put in one of them; of course, not of constant labor, but to be picked up at odd times when there was nothing else to do. The polisher has also to guard against chipping the stone, for it should be understood, the diamond has a grain the same as a piece of wood, and the least carelessness might result in knocking off a third of its weight. While disasters of this kind are not infrequent, they are seldom the result of inexperience or laxity on the part of the workmen. When a polisher takes a stone, one of the first things he does is to find out the direction of its grain, so as not to cut against it.

MICROSCOPICAL SOCIETY.—At the annual meeting of the San Francisco Microscopical Society a proposition to reduce the price of membership was unanimously voted down. After transacting the routine business, the following officers were elected for the ensuing year: President, E. J. Wikeson; Vice-President, Dr. J. M. Selfridge; Recording Secretary, Wm. E. Loy; Corresponding Secretary, A. H. Breckenfeld; Treasurer, Chas. C. Riedy. The society is endeavoring to secure larger rooms and feels very sanguine of success. The finances are in good condition and the affairs of the society are prospering. Many additions to the library and apparatus have been made since organization. The growth of the society has been slow, yet its membership has steadily increased.

A NEW NON-FUSIBLE BULLET.—A bullet has just been patented, the base of which, as well as the body, is covered by an alloy non-fusible at any temperature which it is possible to generate in a gun barrel. The necessity for such a bullet has been caused by the introduction of nitrated or smokeless powder, which generates such intense heat that the base or head of the bullet is melted and consequently made ragged. Accuracy of aim is thus much impaired. The tendency of late, in the desire to secure increased accuracy, has been to diminish the size of the bore and resort to compressed powders and cased bullets, and the new bullet comes in most opportunely and enables the latest improvements to be utilized.

THE MELDOMETER is the name given to a new and simple instrument for observing the behavior of bodies at high temperatures. It fits the stage of a microscope and consists of a platinum strip between two clamps. An electric current heats the strip, and material laid on it is soon heated up, the temperature being regulated by a carbon resistance controlled by the operator. Quartz is easily melted by this method, which also possesses the property of being applicable to the examination of sublimates during and after their formation.

SPONTANEOUS COMBUSTION IN SILK.—A new ocean danger is pointed out by silk importers. It appears that dyed sponge silk, known technically in the trade as French silk, is, under certain conditions, exceedingly prone to combustion and is well known among the steamship companies as dangerous freight.

SCIENTISTS are still in doubt what causes fire to burn blue when salt is thrown on it. Copper, chlorine and carbonic acid are each said to be at the bottom of the mystery.

The New York Cancer Hospital on the San Francisco Cancer Cure.

An Open Letter to the Managers.

Some two months since a request was sent to the managers of the New York National Cancer Hospital asking them to send to this city two or three patients, for trial treatment, afflicted with typical cases of cancer in as many of its various forms. The request was made of that institution mainly because its original promoter was the widow of one of San Francisco's most honored and respected citizens, General Halleck. That lady died from cancer; but just before her death she laid the plans for founding that institution, gave \$50,000 in cash, and left in her will property valued at about \$150,000, a large portion of which has already been realized and transmitted thither by her executor, Col. G. W. Grannis. The lady died before the hospital was built, and often during the last days of her life, as we are told by Col. Grannis, she expressed the wish that the managers of the hospital, whoever they might be, when they came to take upon themselves such management, should make the cause of cancer a special study and also make special efforts to seek a remedy.

It was for this reason that Col. Grannis and some of his friends, the writer among the number, thought it no more than right that that institution be memorialized to lend its influence in the manner proposed, to make a thorough investigation into the value of the alleged remedy for that disease which, to all appearances, has been successfully employed for several years in this city.

Col. Grannis recently received a reply to his letter from Henry C. Coe, M. D., the attending surgeon of the hospital and Secretary of the Board of Managers, as follows:

G. W. Grannis, Esq.—MY DEAR SIR: An apology is due to you for the long delay in replying to your favor of Dec. 27th, addressed to Mr. Parsons. It has received careful consideration from the Board of Managers and was referred by them to the Medical Board, by whom I am instructed to reply as follows: After a careful review of the various reports of the San Francisco Doctor Cook's cases, the Medical Board are unanimously of the opinion that it would be unwise to send patients there for treatment, as it would open the doors to other cancer-curers who are constantly urging their claims upon us. While we are always ready to accept and to try any remedy for cancer which is presented openly and in a scientific spirit, we are not willing to submit our patients to any experiments the progress of which we cannot watch ourselves.

So far as we can see, in not a single case of "cure" by Mrs. Cook's treatment was the tumor examined microscopically (1) and the diagnosis of cancer thus confirmed—the only sure means of diagnosis. Moreover, the party only claims good results in the incipient stage of cancer. (2) These are just the cases in which complete removal by the knife promises a permanent cure—of which I have two examples in my own family (my own mother being one). (3)

I may add, my dear sir, in order to convince you that we are not liberal in this matter, that we have taken the pains to find out through medical friends in San Francisco, Mrs. Cook's manner of treatment, (4) and we can see little difference between her method and those of the innumerable "cancer doctors" who flood the country with their pamphlets. Thanking you for your interest in the hospital, and for your valuable services in its behalf, I remain, very truly yours,

HENRY C. COE, M. D.,

Attending Surgeon and Secretary of the Board of Managers,
New York, Jan. 26.

Comments on the Above.

(1) In regard to this matter, we would call attention to the well-known fact that when in case of cancer the nipple in the breast is largely retracted and drawn in, every surgeon will say it is a reliable diagnostic sign of scirrhus. Of course it is not so absolutely reliable as a microscopic test. In Mrs. Dr. Cook's patients, this condition has often been reached and been successfully treated. The retracted nipple has also been accompanied by the usual indurations, with adhesion of and dimpling of the skin over the tumor. Moreover, before resorting to Dr. Cook, a number of such patients have been pronounced by leading medical men to be suffering from scirrhus cancer. Some of her cases have even reached the operative stage. In cases which had not reached this stage, but which manifested all the other indications, would any surgeon in any hospital think of eluding and probing the tumor to obtain diseased tissue for microscopic examination? No; he would say, as has been said and testified to by some of Dr. Cook's patients: "The doctor said that when he had taken my breast off he could tell if it were really cancer."

Mrs. Cook's rule is, not to wait a moment, but to attack at once, with her alternative medicine and absorbent saline, the deadly malady. In how many cases, we solemnly ask Dr. Henry C. Coe, has the microscope been used in the past by the mutilating surgeon? Is it the rule among surgeons to use it? In what proportion of cases operated on do surgeons make sure of the tumor being malignant with that instrument? We assert that if the microscope be the "only sure means of diagnosis," it will entail a waiting on the part of most patients which must end in but one way.

Dr. Cook would never permit a breast to be eluded and probed in experimental barbarity. An unbroken surface on the skin has been one of her great feats in her line of treatment, which is very different from that em-

ployed by the "innumerable" cancer doctors," or the useless hutchery of knife-wielding surgeons.

(2) Dr. Coe has been altogether misinformed in this regard if we understand what he means by "incipient stage." We believe the faculty will admit that when a case has so far advanced that there is a most marked retraction of the nipple and the surgeon is ready to put his knife into the breast, it has then quite passed its "incipient stage," and then is the most immediate danger that the virus will begin to pervade other parts or organs of the system, if it has not already done so, through the medium of the lymphatic glands. Yet it is just such cases that Dr. Cook most willingly undertakes to cure, and succeeds in nine cases out of ten. Even beyond that, she has treated successfully quite a number of cases when under the full conditions above named, and even after the patients have been first operated on and the cancer has again made its appearance. One such case from the city of Washington was present at the meeting which Col. Grannis attended. We submit that such cases are not in the "incipient stage."

We are prepared to furnish the fullest evidence that Dr. Cook has cured a number of such advanced cases, not extirpated but dissipated the cancers by simple local outward applications, accompanied, as they always must be, by inward alternative remedies. In such cases the skin is not even abraded, and no pain given whatever. Can any of the innumerable "cancer doctors," or even regular practitioners, lay claim to such success?

At the risk of being tedious, we will name two cases now under treatment.

Three or four weeks since several prominent ladies and gentlemen of this city (one of the former holding graduation diplomas from each of the three medical schools) met in the parlors of Dr. Cook to inform themselves more thoroughly by personal conversation with her patients in regard to her alleged cure. While at that meeting, a lady and her husband came in from the city of Seattle, Washington, and asked for an examination. The doctor alluded to and Dr. Cook made an examination and pronounced it an unmistakable case of scirrhus; the patient then remarked that three leading physicians in Seattle had also pronounced it scirrhus. The visiting ladies present then proposed that one of their number should take the patient to a prominent San Francisco physician a few blocks away and get his opinion. The suggestion was acted upon and the case again pronounced unmistakably scirrhus. It was then determined by those present to make this a test case. To make it still stronger, the writer called upon another prominent physician—one of the oldest and most reliable in the city. At our request, he visited Dr. Cook, examined the patient carefully, witnessed the treatment, examined her remedies, and then gave his attention to another among several patients who happened to be present, and pronounced each of them typical indisputable cases of scirrhus. Both of these cases are doing well and yielding kindly to the action of the remedies which are being used. Of course they are not yet cured, but they will be. When the result is reached we shall report it in these columns, whether favorable or otherwise. We trust our readers will be kind enough to watch for it.

(3) Dr. Coe, it seems, would operate on cases that are "in the incipient stage." Why does he? He apparently acknowledges that Dr. Cook may cure such cases. We know she does, and we have never heard of such a case undertaken by her which she has not cured when the patient has remained with her and followed her directions. If Dr. Coe will send an expert here where the witnesses live we will give him abundant proof of all the facts herein stated. Why maim and destroy a woman's breast with the knife where the trouble can be easily removed without breaking the skin? Such cases may be cancer, they may be merely benign tumor, but they are cured all the same. Why then use the knife? When the knife or plasters are used, the hooks, and surgeons as well, tell us that the malady returns in nineteen cases out of twenty. Why? Mainly because the extirpation is not followed by proper alternative, constitutional medicines. The doctors don't believe in it. Dr. Cook does. She always asserts, and could not effect permanent cures without it. Not one of all the many cases which she has treated and pronounced cured has ever returned. This we claim to be the climax of proof that she has a positive specific.

(4) Here Dr. Coe is again wide of the mark. He has found out no such thing. To our certain knowledge he has never written to a single "medical friend" in this city who knows anything about Dr. Cook's manner of treatment. We have visited all in this city who do know anything about her treatment, and no one of them has received any communication from Dr. Coe. The fact is, Dr. Coe has been imposed upon by some "medical friend" who assumes to know, but who has never visited Dr. Cook and knows no more about her treatment than does Dr. Coe himself. Will Dr. Coe be so kind as to furnish us with the names of his "medical friends" in this city who have furnished him this information, as we have already requested him to do in a private letter?

The common received opinion of Dr. Cook's treatment among medical men in this city is as wide of the mark as the north and south poles are apart. The trouble is, medical men refuse to inform themselves as to the truth of this matter, though often asked to do so. Dr.

Cook's doors are always open to any honest investigator and her remedies are also open to inspection.

Dr. Cook Employs no Arsenic or Other Poisons as the Regular Physicians and Other "Cancer Doctors" Always Do.

It is the common report that Dr. Cook employs arsenic or other caustic mineral in the way they are generally used by the "regular faculty" and the "innumerable" cancer doctors who flood the country with their pamphlets. True, Dr. Cook formerly used a mild form of plaster to aid her remedies, but only in exceptional cases. During the last few years, however, by reason of improved remedies, she has been able to dispense with them altogether. Several of our more liberal physicians who are indifferent to the anathemas of the faculty, have, from time to time, investigated and become satisfied that her methods and remedies are eminently worthy of official investigation, but the ruling majority refuse to look into the matter at all. On the contrary, they shelter themselves in a stolid agnosticism, while many even allow themselves to drop into the resort of all big game—personal abuse. These are the reasons why the inquiries from New York have not been correctly replied to by the "medical friends" in this city. As already said, Dr. Cook uses nothing but the mildest remedies, such only as are derived from the vegetable kingdom. Her remedies are open to chemical tests, and every doctor knows that minerals can readily be detected in any preparation. That she has cured large numbers of cases which have been pronounced cancer by the most reputable physicians of this or any other city is incontestable of the most positive proof. Her treatment is for the cure of cancer—not for extirpation, as is the treatment of the regular faculty and other "innumerable cancer doctors."

Why Do San Francisco Physicians Ignore This Cure?

And why do they refuse to investigate a matter of so much seeming importance which lies at their very doors, while they rush by scores to experiment with the secret remedy from Berlin? This is a conundrum which we acknowledge being unable to answer in a way satisfactory even to ourselves. We have asked quite a number of physicians and others, and have received such answers as the following: 1st. "Well, there is more money in the present mode of practice." 2d. "Physicians must live, you know." 3d. "It is a secret remedy." 4th. "We don't believe in it." 5th. Dr. Cook is a quack," etc., etc.

We prefer not to make any comments on the two former answers. In regard to the third, we would reply, "So is Dr. Cook's." 4th. Then why not make a slight effort to look into it as you are doing with the consumption cure? 5th. If a quack, she is a very good quack, and many lives would be saved and an immense amount of suffering avoided in this city, if every physician was just such a quack.

There is One Other Important Reason.

It is the pressure brought to bear upon almost every one in the profession who attempts to inquire into this question. Some three years ago a friend of the writer, a young doctor in good standing in his profession, and a clinical teacher in the Cooper Medical College, ventured to look into this matter long enough to satisfy himself that there was much in it. He prepared a paper in regard to his investigations and attempted to read it at one of the monthly meetings of the San Francisco City and County Medical Society. He was summarily ordered to take his seat, and no effort of several of his medical friends could avail to obtain for him permission to read his communication. The writer, who was present at the meeting by invitation of a medical friend, was requested to leave the room. This is one of the many means resorted to to suppress the truth. Free speech is not allowed in the meetings of the San Francisco Medical Association, any more than it is in autocratic Russia.

The young physician alluded to, who deserved better things at the hands of his medical brethren, was dismissed on the following day from the position which he had diligently and faithfully filled in the Cooper Medical College. These facts are beyond dispute.

One or two of our other physicians who have been desirous to investigate have been notified that they must cease all such inquiries or their names will be dropped from the roll of the association.

The Malediction of the Profession.

That the practice of three years ago is still in force is shown by the following recital, the truth of which can be shown, although for evident reasons the name of the physician cannot be given. The occurrence took place some four weeks ago. The reader of these lines will please refer back to the mention made of a patient having been taken from Dr. Cook's rooms to those of a physician near by, who reiterated the diagnosis of others that the case was one of advanced scirrhus. A friend of that doctor who had knowledge of the facts, and who is one of high standing in this city, called upon him a few days since, and in reference to that patient remarked that she was getting along finely and would soon be discharged as cured. The doctor still persisted in his assertion that it was a genuine case of scirrhus, and manifested quite an interest in the manner of its treatment. He was asked by his friend to call and see for himself the treatment followed and

notice the progress made toward what was unmistakably soon to result in a thorough removal of the malady. He in effect said that it would not do for him to take any steps in that direction, as it would result in bringing down upon him the malediction of his professional friends, or words to that effect.

These are hard sayings but solemn truths. We appeal to all candid people if these things are not a shame and disgrace. It is for this reason that some of our most influential citizens, both male and female, are now inquiring into the truth of what is reported in relation to this whole matter, with a view, if found true, to take such public action or otherwise as will place these things still more prominently before the people.

The Mode of Treatment

Differs in toto from any which has heretofore come under our notice. It is in perfect keeping with the usual practice which physicians all over the civilized world have employed for thousands of years in the general treatment of diseases. There is no pretense, as in Count Mattei's treatment, now so prominent in Europe, of a "vital electric principle," something akin, perhaps, to Keely's "etheric vapor," which the Count claims to "infuse" into his remedies to make them potent. Nor is there any severe treatment with caustics, as is usual with all other practitioners, regular and otherwise. The treatment is usually entirely painless—never anything like evergreen oil. "Specifics" are employed as unguents, simply aided in their penetrating power by the use of a mild galvanic current as a carrier. These, to break down the diseased tissue, while other "specifics" are at the same time employed as alternatives to carry off the effete matter through natural channels, the blood, etc. The treatment assuages rather than induces pain. Every portion of the several remedies employed, whether nuctions or alternatives, is derived either from the vegetable kingdom or from milk. The remedies are also varied according to the locality and different characters of the malady, and all are employed in accordance with general medical practice. Dr. Cook's practice differs from all others—in that she cures while others simply remove. We know of no other treatment where more or less do not return. We have never known a single return in her practice.

A Reality or a Fraud.

The San Francisco cancer cure is a reality or it is a fraud. We holdly assert the former, challenge an inquiry, and in the name of humanity and justice call for an investigation. We don't propose to stop this controversy so long as we live, and are able to wield a pen or utter a word, until some proper and acknowledged authority has investigated and pronounced upon it.

What is called for is simply an investigation into the reality of these asserted remedies by the medical faculty of this city or some other locality. If there is nothing in them, that fact can be readily arrived at. We hold that the cumulative evidence adduced is more than sufficient to warrant an inquiry. The object ought to be one of the highest importance which can interest any city or any people. It is one which means life or death to not less than 600 people in this city alone, who are this day, and every day in the year, suffering from the most dreaded malady with which humanity is afflicted. Fully twenty of these people are dying in San Francisco every month. Is it not the business of our health conservators to look into anything which has even the most distant prospect of deliverance?

But it is a secret remedy and we must not touch it, say our doctors, and when we essay to get some aid for an investigation from a great charitable institution in New York founded by San Francisco benevolence, we are unexpectedly thwarted in our efforts by some "medical friends" in this city, who know nothing about it. Why interfere? We hesitate to give the reason propermost in our mind. What other can be imagined?

It is a secret remedy—so is Keely's—and whenever the faculty will take hold of these as they have of that, and test it as thoroughly as they are doing that, if it proves a success, there are those who stand ready to pledge themselves that it shall be given as freely to the world as Keely's will be given, if it should prove a success. What more can be asked for?

We have taken up the matter of the New York letter because it was at our request that Col. Grannis took an interest in it and wrote to the president of the N. Y. Hospital. He afterward requested the writer of these lines to write to the managing physician, which he did. He wrote a carefully prepared and kindly letter asking for an investigation. But so far no notice has been taken of that communication. And now, since the reply to Col. Grannis has found its way into the public press of this city with editorial comments reflecting somewhat severely upon Dr. Cook, we feel it our duty to write this open letter in answer to Dr. Coe, as he has evidently been misinformed and misled by some San Francisco physicians in reaching his conclusion.

The comments of the *Examiner*, in which paper the letter appeared, we care nothing about, as they will produce no prejudicial effect upon the public of this city, where that paper and the present writer are both well known.

Passing Events; The Mining Interests and the Legislature; Mines on Odd Sections; Tug-Boat Charges; Heavy Coal Receipts; Imprisoned in a Mine, 136. Ventilating Quartz Mines; The Regan Vapor Engine; Our Rivers; The Government Commission and Debris, 137.

ILLUSTRATIONS.—Electric Hoist for Mining Work; The Gates Portable Rock-Breaker with Elevator and Screen, 129. The Regan Vapor Pumping Outfit; Regan Vapor Engine in Launch; Ventilating a Deep Mine; Ventilator for Exhausting Air, 137.

CORRESPONDENCE.—The Keltz Mine, Tuolumne County; Mines of Washington; The Union Mine, Copopolis, 130.

MISCELLANEOUS.—Comstock Ore Extraction; California Parks, 130. Amalgamation at the Comstock Lode; Manufacturing Establishments Increase; The Electrical Adhesion Question, 131.

MECHANICAL PROGRESS.—The Evolution of Machinery; Shot and Burnt Iron; The Testing of Iron and Steel; On the Crystallization of Iron, 134.

SCIENTIFIC PROGRESS.—The Artificial Production of Rain; The Modern View of Electric Currents; Phosphorescent Centipedes; Knots in Diamonds; Microscopical Society; A New Non-Fusible Bullet; The Melometer; Spontaneous Combustion in Silk, 134.

GOOD HEALTH.—The New York Cancer Hospital on the San Francisco Cancer Cure, 135.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 132-133.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, etc., 140.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 140.

Passing Events.

The coast experienced the worst storm of the winter during the past week, and one of the worst we ever had here. The rainfall was excessive, and while it was welcomed in some quarters, it did damage in others. In the southern part of the State and in Arizona, bridges have been washed away, railroads damaged and some towns flooded. At San Francisco, a vessel was wrecked and 18 lives lost, and other craft were injured.

The Debris Commissioners have at last made their report public, and a synopsis is given in another column. It will be necessary to wait for more details in order to understand its full hearing. However, the Commissioners suggest the expenditure of certain sums on the rivers, but as the session of Congress is so nearly over, nothing will be done for the present.

The Governor has signed the bill repealing the Act declaring the Klamath river navigable, so that the miners of that region can now go on with their work with no fear of interruption. A number of other bills in the interest of the miners are still pending.

MECHANICS' INSTITUTE TRUSTEES.—At the election of Trustees of the Mechanics' Institute on Tuesday, the following were declared elected: George E. Dorn, Andrew Wilkie, Irwin C. Stump, Oscar Lewis, Frank Dalton, M. A. Dorn, S. J. Hendy, D. A. Macdonald, John Mallon.

CHIEF OF MINES.—Director-General Davis of the World's Fair has stated that he had definitely settled upon T. J. V. Skiff of Denver as the chief of the mines and mining bureau. Mr. Skiff is a National Commissioner. His selection was made some weeks ago, but the appointment was not made official.

The Mining Interests and the Legislature.

The bill repealing the Act declaring the Klamath river navigable, which passed both houses of the Legislature, has been signed by the Governor, so that hydraulic mining may again go ahead on the upper Klamath.

The bill, which provides that cities or counties which sue persons or corporations of other counties must have the cases tried in other disinterested counties, passed the Assembly but has not yet passed the Senate. It would be of advantage to the hydraulic mining men to have debris suits tried where there is no prejudice.

Senator Campbell of Solano has a bill which provides that all mining companies whose stock is sold at a stock exchange must keep complete books, showing all details of receipts and expenditures and all transfers of stock. These books are to be open to any shareholder. This would only refer to mining companies listed on stock exchanges.

The same Senator has another bill to protect the small stockholder in mining companies and prevent brokers using the stock in elections.

Senator Williams of this city has introduced a bill in which it is declared unlawful for any person, firm, corporation or association to buy or sell, or to offer to buy or sell the, or any of the shares of the capital stock of any corporation in any stock board, stock exchange or stock market under the control of any association.

Another bill by the same gentleman provides that all contracts for the sale or sales made of the capital stock of any corporation or association, or any part thereof, on margin or to be delivered at a future day, are hereby declared to be unlawful.

The remainder of the bill describes in detail the kind of contracts which shall be deemed unlawful.

As will be seen, these last bills are aimed at the mining-stock business in this city.

Besides two bills, a joint resolution was passed by both houses asking Congress to appoint commissioners to come to California, examine our rivers and hydraulic mines and take such action as would enable some of the harmless hydraulic mines to resume operations.

Mines on Odd Sections.

The miners of a portion of Shasta county hold a meeting on Saturday of this week to consider the subject of mining claims on odd sections of land in the mineral belt. Miners of Igo, Horsetown, Muletown, Texas Springs, Centerville, Lower Springs, Shasta, Whiskeytown, Oak Bottom, Tower House, Flat Creek, Motion Creek and Squaw Creek are to be present. Mineral affidavits will be furnished and acknowledged before Justice of the Peace and Notary Public, without charge. Miners now have this opportunity to protect themselves, and unless they make a rally, and do so on this occasion, the mineral lands will be, to a certain extent, barred against them.

The mineral domain of the country is being gradually narrowed, the railroad companies and agricultural claimants taking possession of much that should be left free to prospectors. One main reason for this is that the miners do not take the trouble to refute the affidavits concerning the character of the land. If they have no claims there they let it go, and then, when a patent is granted, the mineral becomes the property of the agricultural claimant.

It was never the intention of the Government to let the railroad companies or individuals have any of the mineral lands of the country. These lands were declared free and open to prospectors under certain restrictions. But many thousands of acres have passed into the hands of private parties—minerals and all. If the miners of each region would band together as the Shasta men propose to do, much of the trouble could be averted, and the mineral lands be kept for those for whom they were intended.

At Mare Island Navy Yard the last stone has been put in place on one of the greatest dry-docks in the world. The work has cost nearly \$3,000,000 and has been carried on under the professional supervision of Engineer Walcott. The dock has been in use for some time and has received some of the largest warships of England and France, which have accepted its hospitalities for the purpose of cleaning and repairs.

Tug-Boat Charges.

The events of the week, in connection with the storm and shipwreck on the coast, bring into prominence the tug-boats of the bay and their methods of operation. It seems that while they make a good deal of money out of shipping when the ships are prosperous, they are apt to make a great deal more when the ships are in distress. This is a great commercial community, having much to do with shipping, and we have one of the finest harbors in the world; but the harbor has got into disrepute with shipmasters and owners on account of the excessive harbor charges of various kinds, among which are included expenses of tug-boats. These charges are less now than there is competition, but there is still room for great improvement.

One custom which is a bad one is that of the tug taking the ship's hawser instead of giving its own hawser for towing. The boat, the engine and the hawser are the three essentials of a tug-boat, but when they engage to tow a ship they do not furnish the hawser unless paid extra for it.

This is all wrong. The tug ought to be compelled to furnish all the necessary appliances for towing, of which the hawser is one of the most important. When a man hires a horse and buggy ashore, he expects the traces to be furnished with the outfit. The case is parallel in hiring a tug-boat.

When the tug took hold of the ill-fated Elizabeth off Lime Point and began to tow, the hawser (which in this case belonged to the tug) broke. After some time it was again passed to the ship, and when off Point Bonita it again parted, the ship went adrift and struck on the four-fathom bank of the bar, where she lost her rudder and was subsequently wrecked and 18 lives lost, including the captain.

Now what business has a tug-boat to have a hawser which she can break under any circumstances? It ought to be big and strong enough to stand more strain than the tug could put on it. If the tug can break it, she ought to be liable for all damages resulting from the breaking.

One tug-boat captain refused to take the lifeboat in tow out to the distressed ship, and another captain took the lifeboat in tow on the return, started up quickly, capsized the boat, by which means one man was drowned, and then the tug went on her way without assisting in an attempt to save the life of the lifeboat captain.

This is not a very nice record for the tugs in the Elizabeth case. Finally two got hold of her, but could not keep her off the rocks and she was lost.

On the same day the Jessomina struck on the same shoal part of the bar in attempting to leave the port after an unsuccessful attempt to enter and brought up down near Point Reyes in a dangerous position. For 36 hours she lay there in sight of the lighthouse, signaling for a tug, but no attention was paid to her signals by the lighthouse men though word was sent by a fisherman. Finally a tug did come and demanded \$12,000 from the captain to save his ship. The captain offered \$6,000, but the tug refused and the ship had to pay the \$12,000.

If this is not legalized highway robbery, it is the next thing to it. Such a demand made, under the circumstances, when the ship captain could not refuse, ought not to be allowed by the courts. It is a disgrace to the community that such things can be permitted. Double or treble the usual prices for towing or many times the cost might be charged, but such extortion by a tug-boat should not be permitted.

These things are decidedly bad for the reputation of the port and the community. The ghoulish action of the men on the Marin county shore in refusing to lend horses to the life-boat men to haul their rocket apparatus to the wreck; in refusing to send the saved men to town in a wagon; in refusing to help search for the bodies and in helping themselves to all they could find, is no worse than the action of the tug men of this side of the bay, unparalleled as it would seem to be.

The government spent great sums and much time in breaking up the wrecking gangs on the Eastern coast, and has established life-saving stations to help the distressed mariner. But these instances here show man's inhumanity to man in a strong light. The poor people of a coast line may have some excuse in poverty for

robbing shipwrecked sailors, but there can be no such excuse for the tug-boat owners, and their actions are not much better than those of the common wrecker. If a certain sum is not paid them, far in excess of what is usually demanded, then the ship can sink for all they care. It is trading on the necessities of a class which is put a stop to in all other occupations where it is possible. If there are authorities who can regulate these things, now is a very good time to begin to regulate them. If the State has jurisdiction, the Harbor Commissioners ought to take cognizance of these events. If not, the Government officials, who haul up poor Jack if he mutinies, or take away the license of a ferry captain for a collision, might turn their attention to the actions of the tug-boat men. If these things have grown up by custom, it is time to stop the custom, which is a bad one.

Heavy Coal Receipts.

The receipts of coal at this port for the past week aggregated 71,052 tons—the largest quantity on record in the same space of time. Of this, 46,223 tons were from foreign sources, 27,175 tons from Australia, 16,834 tons from Liverpool and 2219 tons from Glasgow. The Pacific Coast coal amounted to 20,888 tons, and that from Atlantic ports 3940 tons.

San Francisco is rapidly increasing in importance as a coal-distributing center and also as a point for its consumption. The figures given will, however, show how much we have to depend upon foreign coals. Very little comparatively comes from Atlantic ports. A large portion of what is known as coast coal is really foreign, coming as it does from British Columbia.

Last week the prices of coal dropped materially, and, under the heavy receipts, a still further reduction in prices has occurred. It is stated also that prices even lower than published quotations may be had by large buyers who take coal from the ship's side.

The manufacturing interests are greatly benefited by these liberal receipts of coal. One great drawback to manufacturing in this State has been the excessive cost of coal as compared with other centers. But as the commerce of the port increases, and more steam and sailing vessels come here, the coal receipts increase and cost lessens. One vessel that came this week had to sell her coal for less than it cost, she having arrived on a low market.

Our coast collieries also are increasing their outputs, and more mines are being opened. Many small veins of lignite have been found on the coast of late which furnish product for local consumption, which is a great help to interior towns.

Imprisoned in a Mine.

Five Hungarian miners were rescued alive from the ill-fated slope No. 1 at Jeannesville, Pa., after having been imprisoned 18 days. How they survived is a miracle. Nothing like it has been known or heard of in the Pennsylvania fields. While two men were searching in a braid of the east gateway, they came across the five Hungarians huddled closely together and almost dead. They were so weak, with but one exception, they could not be moved. Doctors were at once summoned, and a large stock of blankets taken down. Careful nursing will be given them, and every effort put forth to save their lives. The searchers say that their attention was attracted about 9 o'clock by a slight tapping on the walls, and, working in that direction, they finally came upon the men. John Tomakusky had been endeavoring to make himself heard, and, in a faint voice, informed them that he and the others were almost dead from hunger and cold. It was not long before the men were reached.

Tomakusky, when partially revived, said the contents of their dinner-pails kept them alive for six days. Then they lived on the oil from their lamps and bottles. After that was exhausted they drank dark, sulphurous water. The 13 bodies of the men who were killed in the mine have been found. These five miners were those unaccounted for.

"DIAMOND" JOE REYNOLDS, the Chicago millionaire who owned the Congress mine, Arizona, died on Saturday last. He had many heavy mining investments near Prescott and his death is quite a loss to that section.

Our Rivers.

The Army Board appointed to make a preliminary examination of the Sacramento and Feather rivers, and the Debris Commission of engineers appointed to investigate the debris question, as far as it affected our rivers, have both made reports to the Secretary of War, and through him to Congress.

The first board summarizes recommendations as far as they relate to appropriations as follows:

1. A permanent yearly appropriation, not to exceed \$25,000, for the improvement and conservation of channels and banks, by use of a snag-boat and crew, on the Sacramento river above the city of Sacramento.
2. A specific appropriation of \$275,000 for removal of obstructions in the Lower Sacramento, and \$25,000 for the closure of Jacob's slough, on the east bank of the Sacramento, above the city of Sacramento.
3. A specific appropriation of \$300,000 for treatment of the Yuba near and above Marysville.
4. A specific annual expenditure of \$20,000 for improvement of the navigable channel of the Feather river.
5. In closing this report, the board desires to say that a levee system, in great part already existing, needs to be projected and completed for the Feather river, in order to secure the maximum improvement of which it is capable.

The Debris Commission's report is given in brief elsewhere in this number of the PRESS. They, too, suggest certain expenditures to improve the rivers.

However, Congress has done nothing and will do nothing this year. One of our Representatives has telegraphed that our rivers and harbors will receive nothing at all at the hands of this Congress.

Meantime come of the rivers, freed from congressional control, are doing as they please, and not being able to carry the storm waters comfortably, are carrying away bridges, washing away land, destroying railroad embankments, and doing whatever damage they conveniently can. It seems very difficult for us to get Congress to pay much attention to improving the water-courses in the State of California. Probably the State is not of sufficient political importance to warrant much expenditure in that direction. The Government does not need to heed the advice of its own engineers or the desires of the inhabitants of this section.

Ventilating Quartz Mines.

In an investigation before the "Ventilation of Mines Board," Victoria, John Harvey, manager of the New Chum United gold mine, described the system of ventilating that mine to the bottom of the 1900-foot shaft. The sketch shows a section of the mine. A is a winze sunk on the eastern reef; B, winze sunk straight down in center of country to reef, then underlay with eastern reef; C, winze sunk on east leg of reef; D, winze sunk for prospecting and ventilation of mine; E, winze or small stope underlaying to west; F, winze now being sunk; G, saddle reef worked out; H, reefs not worked; P, pent-house on shaft and oisterne on it for supplying tanks with water. The mine is connected with New Chum Consolidated at No. 8. The air comes in at this level, goes down the winze and up through the shaft. The whole of the shaft is upcast; nothing comes down the shaft from the upper levels.

At this same investigation a patent ventilator of the Victorian Atmospheric Refrigerating Co. was examined and described. It is shown in the accompanying cut. The actual patent is an injector fan. It is actually a syphon system for air instead of water or steam. The circular motion is given by the small force inserted above the fan on the turbine wheel—a small jet of water as big as a darning-needle will drive one big enough for ventilating a room. As that rushes through it causes a vacuum. It should be, as the circular motion is imparted to the machine below the ceiling, the vacuum is caused by the air rushing through the open mouth at right angles. The air-pipe, presuming it is used as an exhaust, would be attached immediately below the machine, but in using it as a ventilator, for driving the air in it would be reversed. With reference to mines, it must be done by exhaust, a main shaft or pipe carried down the mine, and the machine working above outside the mine, and branches taken away close home to the workings. It is claimed that 9000 feet per minute is obtained by a two-foot machine. For deep mines a larger one

THE REGAN VAPOR PUMPING OUTFIT.

REGAN VAPOR ENGINE IN LAUNCH.

would be necessary. It can be worked by water or steam and is in use in a number of places in Victorian gold fields.

The Regan Vapor Engine.

The Regan vapor engine is operated by means of vapor, being drawn into the cylinder by the suction of the piston and ignited by an electric spark. The carburetor contains a small quantity of gasoline; this carburetor is connected with the engine by a pipe. At each revolution of the flywheel a current of cool air is drawn through the carburetor and into the cylinder. In passing through the carburetor, it vaporizes a quantity of the gasoline; this, when mixed with more air drawn through the pipe and air valve, forms the charge upon which the combustion develops the power.

There is no fire, boiler, steam, coal, ashes, or anything of that kind, connected with the engine. There being no steam used, licensed engineers are not necessary when the engine is used in boats. Neither does it take a skilled engineer to run the engine, for owing to the mechanical construction of the engine, the operation is automatic and no attention is required other than to keep the carburetor properly supplied with oil.

These engines will also run with illuminating gas or natural gas. They are adapted for electric light plants or country houses, mills, shops and hotels, and for all ordinary purposes for which an engine is used. The cut given herewith shows a cheap and convenient pumping plant for irrigation, elevator work and household purposes. This outfit does away with the necessity of belting or shafting, and the pump is arranged so as to change the stroke to meet any required elevation, or to throw the pump off altogether and use the engine for power. This is the latest improved form of the Regan vapor engine.

The other engraving shows the engine applied to a small launch. There is no delay in starting to get up steam, but the heat is ready for use at any time and plenty of power is developed for the purpose of propulsion. The boat engines are of vertical type. The Regan Vapor Engine Co. of this city furnishes engines and pumping outfits, launches, boats, canoes, etc.

VENTILATOR FOR EXHAUSTING AIR.

oped for the purpose of propulsion. The boat engines are of vertical type. The Regan Vapor Engine Co. of this city furnishes engines and pumping outfits, launches, boats, canoes, etc.

THE extensive circulation and prominence given to the State horticultural and viticultural interests by "California on Wheels" have caused the inception of a novel scheme which will shortly be carried into effect. The plan, which was conceived in this city, is to run a well-fitted car through the towns of Oregon, Washington, Montana, Idaho, and the States

1900 Feet—Bottom of Shaft.

VENTILATING A DEEP MINE.

and Territories west of the Missouri, containing samples of the manufactured products of our State.

The Government Commission and Debris.

The Secretary of War has filed the report of the Commission appointed by the Act of Congress in 1888 to examine hydraulic mining in California and report upon the losses sustained by the deposit of debris in streams. The examination was begun in the spring of 1889 and concluded in the fall of last year. There is a full description of hydraulic mining in the upper and Sierra districts and a review of its progress and results, and the law suppressing the dumping of refuse matter is given. There are also tabulated statements showing the depth of deposits of debris at different points as compiled by the State authorities and others interested in the controversy between the miners and farmers.

The report is signed by Lieutenant-Colonel W. H. Bagnard and Major Thomas H. Henry. The board caused an examination to be made of the injured lands bordering on the Feather, Yuba, Sacramento, American and San Joaquin rivers and their tributaries, and surveys were made of the channels of the Sacramento and Feather rivers. Assisted were sent into the field for the purpose of examining the canyon of the different rivers and their tributaries into which debris was dumped, and surveys were made of selected sites for debris dams. The particular sections visited were those which had been the scene of former mining operations on a large scale or which represented typical mining districts.

The concluding remarks of the Commission are as follows: "The duty devolving upon the board is to ascertain if some plan cannot be devised whereby the present conflict between the miners and farmers can be adjusted in order that the hydraulic-mining industry can again be carried on without injury to the farming interests and the navigation of rivers. It is not apparent that any expression of opinion or recommendation will have any effect in rehabilitating the industry in the present legal status of the question. Without some modification of the existing conditions, hydraulic mining must cease. It cannot be carried on without violating the decrees of the courts.

"If, however, by a reversal of the opinion of the courts, or by other means, hydraulic mining can be permitted in whole or in part, or if without such reversal, an expression of opinion is required as to the feasibility of impounding mining debris, the board will state that the investigation and examinations made indicate that in isolated cases it is possible to impound debris without injury; also that locations exist in the canyons of different mining streams in the Sierra district where permanent stone dams, properly constructed, will retain large quantities of material of a character formerly mined out, and which has caused the destruction of farming lands and injured the navigation of rivers. These dams, however, will not be effective in impounding all the material delivered into the canyon from the mines. Being in streams and in the pathway of freshets, portions of the heavier material will be carried over the crests of the dams, to eventually find a lodgment in the river below. The finer sands and clays cannot be effectually impounded by such barriers, but will be carried off in suspension. With the improved condition which it is desired to give to navigable rivers, it is probable that the greater part of this finer material can be carried off without being productive of harm. The construction of dams called for being entirely in the interests of the miners, the cost thereof should be borne by the individuals interested in mining.

"The navigation of rivers in the Sacramento valley has been injured by the operations of hydraulic mining. The injury has been caused by the deposition of vast quantities of mining debris in beds. In addition, there are vast deposits of material lying in the canyon and in the plains below the foothills, portions of which will be carried down during the floods, and eventually lodge in these streams.

"It is proposed to improve the rivers, first, by restraining debris now lodged in the canyon of the Yuba and Bear, and in the plains below by dams and other restraining works; second, by contracting the width of the rivers by brushing dams in their beds. The system of restraint will be continued until the rivers in their improved condition can carry the material brought down.

"The estimates of these improvements are: Feather river wing dam, \$300,000; Sacramento river wing dam, \$300,000; dam on Yuba river at Deguerre point from \$300,000 to \$640,000, according to height; dam on the Bear river at Van Yeeens, \$150,000; restriction works on the Yuba below the foothills, \$300,000, including an annual amount of \$20,000 for maintaining navigation on the Feather river, while the above proposed works are in course of construction."

VALUABLE BOOKS ON MINERALS, MINING AND ASSAYING.

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo, 367 pages. Price.....\$4.50
45¢ A descriptive circular giving the full table of contents of the above book sent free to any one who will send his address.

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 148 illustrations. 12mo, 432 pages. Price.....\$5.00
Mine Drainage. By Stephen Michell. 8vo, 277 engravings. Price.....\$6.00

A Treatise on Earthy and Other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price.....\$5.00
The Prospector's Hand-Book. A Guide for the Prospector and Traveler in search of Metal-bearing or other valuable Minerals. Illustrated. 12mo. Price.....\$1.50

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blow-pipe, by Flame Reactions, by the Spectroscope, and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henry Erni, M. D. Illustrated. 12mo. Price.....\$3.00
Underground Treasures; How and Where to Find Them. A Key for the Ready Determination of Minerals within the United States. By James Orion. Price.....\$1.50

The Assayer's Manual. An Abridged Treatise on the Doctrinal Examination of Ores, and Furnace and other Artificial Products. By Bruno Keri, Professor in the Royal School of Mines, Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by Wm. T. Brann, Editor of "The Technological Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. Lynwood Garrison, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhüttenleute, etc. Illustrated by 87 engravings. 354 pages, 8vo, cloth. Price.....\$3.00
45¢ A circular of 8 pages, quarto, giving the full Table of Contents of this Important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will send his address.

45¢ The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

45¢ Our New and Revised Catalogue of Practical and Scientific Books, 81 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories, and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHEMICAL SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. WILLIS E. EVERETTE**, Consulting Mining Geologist and Chemist, 1313 E Street, Tacoma, Wash.

Mining and Hydraulic Engineer,

No. 307 SANSOME ST., SAN FRANCISCO.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap onto the end of the fuse **Firmly and Absolutely Water-tight**. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$1.50 each.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEB. 17, 1891.

- 446,702.—MAILING MACHINE—G. B. Baer, Liverdale, Cal.
- 446,421.—SKATE—S. S. Black, Pasadena, Cal.
- 446,660.—CARBON FOR ELECTRIC LAMPS—W. J. Burns, Los Angeles, Cal.
- 446,630.—WINDMILL—W. M. Craig, Santa Fe, Cal.
- 446,585.—VENEER-CUTTING MACHINE—E. Densmore, Coronado, Cal.
- 446,439.—CARD-EXHIBITING DEVICE—J. W. Lawler, Sr. and Jr., Burbank, Cal.
- 446,445.—FLOOR-WASHING MACHINE—Lizzie Graham, Portland, Or.
- 446,559.—VEHICLE WHEEL—R. E. Jeffrey, Grass Valley, Cal.
- 446,755.—FISH-NET—L. A. Johnson, S. F.
- 446,756.—INDEX—W. A. Judge, Santa Barbara, Cal.
- 446,524.—PANORAMIC DEVICE—E. W. Keeler, S. F.
- 446,600.—WIRING ATTACHMENT FOR BALING PRESSES—J. H. Kruse, Portland, Or.
- 446,530.—APPARATUS FOR DELIVERING CLAY TO PRESSES—E. T. Mapel, Alameda, Cal.
- 446,603.—SOFA BED—A. G. Phillips, S. F.
- 446,745.—HOSE REEL—W. T. Y. Schenck, S. F.
- 446,763.—RAILWAY RAIL JOINT—J. B. Walker, Corvallis, Or.
- 446,495.—MAILING MACHINE—S. B. Whiteside, S. F.
- 446,654.—COMPOUND FOR PAVING, ETC.—H. F. Williams, S. F.

The following brief list by telegraph, for Feb. 24, will appear more complete on receipt of mail advices:

California.—Josiah Babcock, San Jose, positive shuttle motion for looms; Otto A. Drew, San Francisco, set trigger; Edgar W. Burnham, San Diego, music-leaf turner; I. L. Murrell, San Francisco, fire-proof paint; John C. Miller, San Francisco, annunciator and indicator system; John F. Millerich, San Francisco, gate; James W. Perkins, San Jose, machine for making compound paper and jute twine; John F. Sweeney, San Francisco, perch for birdcage; H. Sweet, Los Angeles, metallic railway tie and chair, and metallic roadbed draw and safety tie; Edgar Thompson, San Francisco, assignor to Pacific Engine Company of California, engine governor; George C. Watriss and C. J. Knighin, San Francisco, cable railway; John Weichhart, San Francisco, machine for forming sheet metal lathing.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PANORAMIC DEVICE.—Ezra W. Keeler, S. F. No. 446,524. Dated Feb. 17, 1891. This arrangement for panoramic or other views is designed to give a continuous and constantly changing vista through an indefinite number of arcs of circles so constructed that they may form parts of various figures, such as octagons, figures of eight, or other irregular forms for maintaining the same angle of light upon the picture and an exact visual distance from the beholder at all angles, and, in connection with this device, the inventor employs a series of cars, platforms, floats or movable supports, peculiarly constructed to contain the beholders and to be propelled by any suitable mechanical device, together with other mechanical effects. Interior to the arcs on the walls of the building, and corresponding to them in curvature and at a sufficient distance from the surfaces to give the proper visual angle, is arranged the railway on which suitably disposed cars or platforms are designed to travel. The design of the device is to have the arcs of such a curvature that each scene will be measurably separated from the adjacent ones while at the same time all the scenes are in a manner continuous so that sections of a country or views may be shown one after the other and conveniently inspected by passengers in the cars without fatigue. This will insure also the transportation of a great number of people through the building without any unnecessary delay or crowding.

SOFA-BED.—Andrew G. Phillips, S. F. No. 446,603. Dated Feb. 17, 1891. This improvement in sofa-beds or bed-lounges consists of the novel locks for holding the hinged or swinging back in an upright position, for use as a sofa or lounge, and for releasing it so that it may be turned down to a horizontal position for use as a bed. It further consists in combination with said locks, of the swinging, supporting bars of the back, their sliding connection with the back and the gravity legs of said back, which when extended are held securely by the ends of the supporting bars. The object of this invention is to cheapen the construction of this class of furniture.

WIRING ATTACHMENT FOR BALING PRESSES.—John H. Kruse, Portland, Or. No. 446,600. Dated Feb. 17, 1891. This invention relates to the class of devices for wiring bales of material within the press, and it consists in certain novel arrangements and constructions intended to provide a simple and effective device of this class.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; post age, 10 cents. Postpaid to subscribers of this paper, 60 cents. Send for illustrated circular. Agents wanted.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By Guido Kustel, M. E. 1890. This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed with facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by Dewey & Co., S. F.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy. Price, \$8.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formula as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

HORACE D. RANLETT, Ores, Mining, and Commission,

420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.

Twenty-one years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters. All business conducted on Cash Basis. Purchase and shipment of Mining Supplies A SPECIALTY. Sales of Developed Copper Mines undertaken. Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

BAND COUPLING. Malleable Iron. All Sizes.

These Couplings are the best in the world, most powerful and cheapest. They have a ball and socket joint, right and left screw and work freely. We use them extensively in our Tank Building Department.

SITUATION WANTED.

BY A COMPETENT MINING AND MECHANICAL Engineer, a position as Superintendent of a Coal Mine, near good school; 20 years experience; can invest some capital if desired. Address B. E., Box A, this office.

Educational.

School of Practical, Civil, Mechanical and MINING ENGINEERING,

Surveying, Architecture, Drawing and Assaying, 723 MARKET ST., SAN FRANCISCO, CAL. And 170 1/2 Second St., Portland, Or. A. VAN DER NAILLEN, President. Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10. Full course of assaying, \$50. ESTABLISHED 1864. Send for circular.

The Evans School

OF ASSAYING AND CHEMISTRY. Rooms 46 & 47, 628 Montgomery St. 2d Floor Montgomery Bldg. } San Francisco. Also, Evening Classes, 7 to 10 o'clock. JOHN T. EVANS, M. A., Principal.

HEALD'S BUSINESS COLLEGE,

24 POST ST., S. F. FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State. SEND FOR CIRCULAR. E. P. HEALD, President. O. R. HALEY, Secretary.

THE PIONEER COMMERCIAL SCHOOL.

Established 1863. Pacific Business College, 320 POST ST., SAN FRANCISCO. Oldest and Best. LIFE SCHOLARSHIPS, \$75. NO VACATIONS. DAY AND EVENING SESSIONS. Ladies admitted into all Departments. Address: T. A. ROBINSON, M. A., President.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of February, 1891, an assessment, No. 22, of Three (3) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 9th day of March, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of March, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. W. BARROWS, Secretary pro tem. Office, Room 11, No. 303 California Street, San Francisco, California.

A GOLD-MILL SUPERINTENDENT

Of long experience, assayer and practical chemist, desires an engagement, particularly in a mill where gold and amalgam is wasted. The best of references given. Address E. W., 1278 Tenth Avenue, East Oakland.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the Best Horse-Power Hoist now made. It is strong and durable.

The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower, in conjunction with hoisting. Manufactured by F. W. Krogh & Co., 51 BEALE ST., San Francisco.

STEAM VERSUS MULES---MAMMOTH AND PRACTICAL HAULING.

THE ACCOMPANYING CUT
Is from a photograph taken while at
work.

It is Cheaper and More
Expeditions.

One Traction Engine will do the
work of 100 mules.

Best's Traction Engines have been
in practical use for over 20 years,
hauling coal, lumber, gravel and
grain, one of which is now hauling
cane in the Sandwich Islands.

It will do the work of
100 Horses.

Plowing reduced to a minimum
cost, and from 35 to 45 acres plowed
each day at an expense of 50 cents
to 60 cents an acre.

Three sizes built, 30, 40 and 50-
horse power, and

24 Best Traction Engines
at Work Now.

It hauls the Gang Plow and Har-
row, propels the Best Combined
Steam Harvester and moves along
majestically with a train of wagons
loaded with grain for the warehouse.

GOLD MEDAL

Awarded this Best Traction Engine
by the State Agricultural Society at
Sacramento, 1890.

BEST'S TRACTION ENGINE HAULING GRAVEL IN SACRAMENTO.

BEST'S TRACTION ENGINE

IS "THE BOSS OF THE ROAD" AND "THE MONARCH OF THE FIELD."

Jobbing of every description promptly attended to.
FINE WORKMANSHIP GUARANTEED.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and
GELATINE-DYNAMITE, Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast
ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and
saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

OAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

HOSKIN'S PATENT BLOW-PIPE AND ASSAY FURNACES,

— FOR —

Chemists, Assayers, Metallurgists, En-
gineers, Jewelers, Dentists, Etc.

NO DUST! NO ASHES!

Portable! Practical! Automatic! Economical!

Will do for every thing that a Coal Furnace or Gas
Furnace will, and WITHOUT A BLOWER.

Send for Price List and Descriptive Circular to

High-Class Rolls.

The ore-crushing capacity of rolls depends on their diameter, speed, and the size and hardness of the material fed to them and on the opening between their crushing surfaces, as well as the regularity of feed. If the pieces fed to the rolls are small compared with the roll diameter, the speed of the rolls may be increased. On the other hand, the quantity crushed will be greater the farther the rolls are apart. The power required for coarse crushing will be much less than for fine.

The patent rolls shown in elevation and plan in the engravings on this page are designed to withstand the severest strains which have to be met in dry crushing of ores. The patent equalizing bar causes the sliding bearing of the rolls always to move equally and to remain in line. There is also a very effective patented method of securing the shells. This method of fastening requires no conical bore of the roll shells, consequently they can be more easily and quickly replaced when worn out, while the advantage of lateral adjustment is also secured without disturbing the roll center on the shaft.

For the heaviest work, the roll shafts are made of steel and the rolls are driven direct by pulleys without the use of gearing.

The frame has planed lugs for attaching a slide-rest to true up the worn roll-shells.

The rolls shown in the engraving are equipped for dry-crushing. Dry fine-crushing rolls require the highest class of workmanship and material. The roll-shells should be of mild steel perfectly homogeneous.

The high class wet-crushing rolls are similar to the dry-crushing style, but the dust shrouding is omitted and scrapers fitted to automati-

PLAN FOR DRY CRUSHING ROLLS.

cally clean the crushing surfaces before they come into action. These rolls are made by the Fulton Iron Works of this city.

Good for a New Mine.

The Smith mine at West Point, Calaveras county, briefly described by our correspondent in another column of this number of the PRESS, is a new claim which has only been operated for about 45 days. They sent about 9000 pounds of the ore down to the Selby Works recently that yielded \$125 per ton. A second batch of 9400 pounds sent to Thos. Price of this city was crushed, sampled and sold on a basis of value of \$141.30 per ton, of which \$132.30 was gold. The last ore taken out assayed \$189 per ton.

The vein has been stripped for 35 feet and averages about 25 inches in width. The shaft is down 118 feet, and this ore was taken out in sinking it. The vein is a strong one, between talc and granite.

The new shaft going down is 4x8 feet in the clear, timbered with 10x12 timbers. New hoisting works and hoiler have been provided, as well as a 6-inch pump, there being considerable water. Robert Smith, formerly of the Lone Star, is foreman, and the mine is owned by Tibbey & Porterfield. There is no mill as yet, but one will be put up when the mine itself furnishes the necessary money to pay for it, as is confidently expected.

THE coinage at the local Mint during the month of February was: Double eagles, \$3,180,000; standard dollars, \$685,000—a total of \$3,865,000.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Tuolumne County Mining Interests.

[From Our Traveling Correspondent.]

Golden Gate.

This property is to-day the leading mine of the county. The mine may be said to adjoin Sonora, being but a few minutes drive from the city. Mr. E. C. Loftus, the superintendent, has labored continuously to place the property on a sound paying basis. At the time of my visit he was about to realize the dreams due to his management. The old plant is giving way to one better adapted to the present condition of the mine, and the more rapid and economical working of the ores. The hoist is being exchanged for a double reel and gear-hoist capable of hoisting from a depth of 1500 feet. The hoists of the Risdon Iron Works manufacture, which alone is a sufficient guarantee of its perfection.

The entire plant is lighted by electricity under the Edison patent with a capacity of 65 lights. Additional water for power is now being brought in through a half mile of pipe 22 inches in diameter at receiving end, and 14 inches at point of discharge. This pipe system will give 300 feet of pressure and very materially lessen the operating expenses, while increasing the efficacy of the plant. In addition to this, there is a completed steam plant that can be connected at any time should the water fail. The free water of a creek that passes over the company's property is turned on to a water-wheel, and with but 33 feet of pressure the average flow of 200 inches of water furnishes sufficient power to run the mill. The power is conveyed by rope 200 feet to the mill. The mill is of ten stamps with concentrators and canvas tables. Owing to the very high grade of the sulphurets the rock from the mine is now selected and the best, when crushed, run into settling tanks and the entire body chlorinated. The average ore is crushed and free gold caught in battery and on plates. The concentrates are saved by concentrators and canvas tables and the concentrates chlorinated. Mr. Loftus has added a chlorination plant for the treatment of the mine's ore, thus making the plant complete within itself. The shaft is now down 300 feet, with drifts run 500 feet on the vein. The entire distance is in ore, showing an unbroken ore body of an average width of 6½ feet, carrying an average of \$2 a ton in fine gold and 2½ to 3 per cent of sulphurets of an average value of \$420 a ton. The mine will soon be complete in every department and will well repay a visit of inspection, while the affable as well as competent superintendent will make it one of pleasure and profit.

San Giuseppe.

This mine is owned by ex-Gov. G. O. Perkins, A. Haley and M. Griffith, with Mr. W. G. Whorf, formerly of Arizona, as superintendent. The property is located within the city limits of Sonora. The shaft is now down 230 feet, with drifts run 200 feet, all in ore. The vein has an average width of 14 inches. The vein-matter carries \$1 a ton in free gold and 2½ per cent of sulphurets that go \$1600 to the ton. The ore extracted is being piled up until the mine shall reach that point where sufficient ore will be in sight to guarantee the continuous operation of a fair-sized plant. Mr. Whorf is to be commended for his conservative plan of operating. If there were more like him there would be fewer failures to record. By thorough development and the securing of large ore reserves in advance, the mine can be operated on a much more extensive scale and by reason of reserves created produce sufficient ore to supply a mill of twice the capacity that could otherwise be supplied from so small a vein, and thus not only double the output but greatly lessen the working expenses of the mine. The San Giuseppe has the reputation of yielding the finest gold of any mine in the State, if not in the world, the average fineness of the gold being .996. Mr. Whorf is gradually getting the mine in shape, and a year from now will no doubt show the San Giuseppe equipped and in successful operation.

The Bonanza.

"The boys" have got down 900 feet on the vein and lately have encountered a small bonanza in what might be termed the gangue of the vein. As it is not in place, the superintendent, Mr. Oliver, does not attach the same importance to the find that he would if it occurred in the vein proper. Since the first of February \$1400 has been taken out and the product is not exhausted. In addition to this shaft the company has leased the extension, which they are operating by tunnel. The formation is here the same as that in the shaft, and the finding of gold leads the company to believe that "the stuff" is there once they get to it.

In addition to the Bonanza, which your readers are aware is situated in the heart of the city of Sonora, Mr. Oliver is operating in Saw Mill Flat, about half-way between Sonora and Columbia. With his usual luck (or rather pluck) he has struck it here too and extracted some \$5000, when the works ceased, just as they were in sight of bonanzas. The works are being reopened and the last bonanza will soon be recovered.

Mason Chlorination Works.

This plant was formerly "The Maltman." Mr. L. Mason is now the owner. He has

engaged the services of a reliable, competent chlorinator, which, added to Mr. Mason's well-known reputation for honesty, will soon give the works all the ore they can handle. The capacity of the plant is 2½ tons a day. The charges are \$20 a ton, less 10 per cent for loss on average ore. The works are situated just at the edge of Sonora, and are a great convenience to the mine-owners of the county.

Belle View.

This mine was formerly known as the Hyde mine. The property is at present operated by Mr. Jno. W. C. Maxwell. In the past, several companies took hold of the mine, and after expending considerable money in development or equipment allowed their bonds to lapse and the property to go back to its owner. Mr. Maxwell purchased outright and has now equipped the mine in an exceptionally fine manner, and the returns are said to be more than satisfactory. The vein at 200 feet is 20 feet in width of rock running well in gold, besides a good per cent of high-grade sulphurets. The mill is a "daisy," being none other than one-half of the famous Josephine mill. It is seldom that such fine machinery is used in mining plants. The mill is of ten stamps, with one Frue and one Woodbury concentrator. Two additional Woodbury concentrators have been ordered. With three Woodburys to the ten stamps the plant will be complete.

I would add that at the time of my visit the superintendent and foreman were both absent, and in consequence I could not gather the information I desired. Should the reader visit the mine, I would advise him to arrange to call during the presence of the superintendent or make arrangement for his own entertainment.

While at the Belle View I met the intelligent engineer formerly of the famous Josephine of Grub Gulch, Fresno county. From him I learned that the published statements in regard to the Josephine are in error. He states that the mine during the two years that it was in operation paid over \$200,000 in dividends; eventually the profits decreased to \$1200 a month. As this was not thought worth bothering about by the worthy Rothschild's syndicate, the mine was ordered closed and the plant sold.

Soulebyville.

The Souleby mine, that for many years poured out a steady stream of the golden metal, is at present idle through want of capital to explore the virgin territory contained within the mine's limits.

The old workings extended to a depth of 900 feet within an average vein of 15 inches that milled \$35 a ton on the average. The last work was a drift started to cut a body of \$45 ore; before the drift was completed the mine was shut down and the ore body abandoned. The mine has still 2000 feet of unexplored ground. It took the old company 30 years to work out 1800 feet to a depth of 800 feet. This reserve would exceed an original location of 1500 by 500 feet. The writer does not profess to be able to see any farther into the ground than the average miner, but no one will dispute the fact, that independent of the ore left in the old part of the mine, this 2000 feet of unexplored ground bids fair to hold within its limits ore equal in quantity and value with the old Souleby workings. The mine is equipped with a most complete plant in the way of hoist, pumps, and complete water-power mill of 15 stamps. Mr. W. Sharwood is in charge, than whom there is no better mining superintendent on the coast. The property is now on the London market, but why it should go there is an enigma, as but a small expenditure would open the mine to a depth of 800 feet from the old shaft.

Black Oak.

This mine is now in charge of Mr. W. P. Scott. The mill is idle while the mine is being developed and prospected. At the time of my visit a body of high-grade ore had been encountered that gave evidence of future dividends. The mill is equipped for either steam or water power, and the high grade of the mine's ores should keep it a steady dividend-paying proposition.

Platt & Gilson.

Mr. A. Trittenbach is again in charge of the mine. This work has shown up a fine body of ore. The shaft is now down 300 feet, with drifts run 600 feet. The ore body just cut is on the 300-foot level. The vein is here 16 inches wide of quartz, carrying one per cent of sulphurets, \$75 to \$80 a ton in value, in addition to the \$8 a ton in free gold. The mill is of ten stamps, complete in every department.

Eureka Con. or Old Dead Horse.

The parties in charge have but little to say and I shall not try to excel them. C. H. Thomas is in charge. The ore is from the 700 and 900 foot levels. The quartz carries 1½ per cent of sulphurets that run from \$30 to \$70 a ton, and an average of \$250 a ton in free gold. The 20 stamps are all running.

The Buchanan.

Mr. E. C. Davis, president, is running along on the even tenor of its way. A new shaft has been put down north of the old workings, and a complete hoist is now being placed in position. The vein is eight feet in width, carrying a good per cent of \$100-sulphurets, besides a profitable amount of free gold. Perhaps you know Mr. Davis?

Jamestown.

The Gem mine, W. N. Harris is owner and superintendent. Mr. Harris has recently

opened up an old vein, which is now 30 feet wide, and neither wall is reached. The vein matter is talc slate; from this Mr. Harris saves \$3 a ton, and when he has his mill properly equipped, he expects to double the amount. The ore body is so large that there is little danger of its giving out, and as the ore is simply quarried out, the work is very profitable.

Quartz Mountain.

Mr. E. D. Bowman is still in charge of the Heslep as superintendent, though he purposes soon to forsake his old love for one of fresher charms in Plumas county. The ore at the present time is coming from a small, flat vein near the summit of the hill, and is said to go \$50 a ton, and from an open cut near the mill. The ore body in the open cut is large but low in grade. Fifteen stamps are running. If the mine was equipped with a 60 stamp modern mill there is but little doubt that the entire Quartz mountain could be worked to a fair profit.

The App.

This mine parallels the Heslep. At present it is being worked under lease, and \$35 ore is extracted and milled in the 5-stamp App mill.

The Dutch Mine.

The Fitzgerald Bros. own and operate this claim. At the time of my visit the boys were sinking a shaft on a vein parallel to the one on which all the work heretofore has been done. The vein was about three feet wide, and the ore of that kind that miners are sometimes charged with filling their dinner-buckets with for ballast—i. e., mortar rock.

Jacksonville

The Willimetta and Tuolumne are being placed on the London market. The mines have a ten-stamp mill. In the past history of the property the management was reckless, if not worse. Granite that did not contain a color in a mountain of it was milled, while the vein proper was not even explored. The mines are on the mother lode, and only need the competent management that they will now receive under the present superintendent, Mr. W. Sharwood, to make them profitable. The Clio, which adjoins the Tuolumne, is said to have got into very high-grade ore, and is now being placed in the Eastern markets. There is a large unexplored field in this section that bids fair at no distant day to attract capital, and eventually prove a valuable acquisition to the mines of old Tuolumne. The county is just on the eve of a period of prosperity in all her mining camps, and the coming year is destined to be the best year in her quartz-mining history. To the mining superintendents and others, who extended every courtesy to your representative while among them, the writer would extend sincere thanks. As for the others—there is no sweet without its bitter; we need the one to bring out and appreciate the contrasts in the other.

E. H. SCHAEFFLE.

The Mines of Calaveras County.

[From Our Traveling Correspondent.]

EDITORS PRESS:—In previous letters I have given you an account of the present condition of the mining industry at Angels and Copperopolis; in this I will endeavor to give a short statement of the leading mines, or those in active operation, in other parts of the county.

Sheep Ranch.

The Sheep Ranch mine, J. B. Haggin, owner, W. H. Clary, superintendent, is dropping 20 stamps on ore from the 900 and 1100 foot levels. The chute is about 600 feet long, and the mine is said to net its owner \$80,000 a year. Outside of this mine there is nothing doing in this section at this time.

El Dorado.

Mr. G. Rodasani holds a number of mines in this and Sheep Ranch district that have been developed several hundred feet and have given very satisfactory mill returns from large lots of ore crushed. The mines are worthy of an examination.

Railroad Flat.

The Lava Bed mine, C. H. Evans and D. Lamson, owners, is located at the head of Nelson's Gulch, two miles south of Railroad Flat, on the El Dorado wagon-road. The property is 1½ miles long, on an east and west branch of the blue gravel lead. The channel is about 40 feet wide, with five feet of blue cement gravel that averages \$250 a ton in bright, coarse gold. Their working shaft bottoms the channel at 100 feet and is in lava ash. This is the first shaft to bottom the channel and prove the value and character of the cement, which is identical with that of the May Flower at Forest Hill. The proof that this channel crosses Calaveras adds a large area to the drift mines of the State. Thus far all the locating and prospecting has been done on this fork; the main channel crosses northwest and southeast, and is not opened that I know of except on the ranch of Bill Porteus near Woodcock's sawmill, West Point. From this point it runs southeast to O'Neill's creek, just northwest of Sheep Ranch. The entire channel is covered with pink lava ash, and on the main channel—which is all open to location—tunnel sites can be secured throughout the entire length of the deposit. Just what the width of the channel is would be difficult to determine, but the lava cap is from nothing to a mile in width. This is a most inviting unoccupied field for very

profitable mining and should attract the attention it merits, as the character of the pay and the extent of the deposit make it an immense mining proposition far exceeding in value all the known quartz ledges in the county.

On the Bald Eagle, Mr. J. E. Enright is putting up a ten-stamp mill to test the ores.

At West Point, the Lone Star, Riverside and Lookwood are closed, as is the Tom Paine. Mr. Brown is below organizing a company to take the Wide West. A number of prospects show good bodies of high-grade ore.

The Smith Mine.

Mr. E. S. Tibbey, as superintendent and owner, is putting up a plant on this mine and crowding things in his usual energetic manner. The mine parallels the Blazing Star. In fact, the vein is almost on the side line. Mr. Tibbey is now sinking on the vein, is down 100 feet, and has a 2½-inch vein of heavily sulphureted rock that carries in addition a large amount of free gold. The average milling rock goes \$50 to the ton, while the smelting or shipping rock averages \$189. The improvement in the adjoining mine, the Blazing Star, as depth is attained, has made Mr. Tibbey determined to stay by it until he reaches an equal or greater depth, when he is sanguine that he will have an equally large and high-grade body of ore.

The Blazing Star.

This is now an incorporated company, with Mr. J. F. Crosett, formerly of the Lookwood and once a type on the MINING AND SCIENTIFIC PRESS, as general manager, and Mr. C. J. Moore, who has stood by the mine through good and bad luck, as superintendent. The shaft is now down 260 feet, and will be continued 100 feet more and levels run before ore is extracted. The lower level, in the present workings, shows a shoot 200 feet long (with chances of it continuing for 50 feet more) of a vein which averages seven feet in width of ore. The milling rock averages \$50 a ton and the shipping or smelting ore \$125 (as can be proven by reference to Selby & Co.). The manager confidently asserts that now the Blazing Star is "the biggest mine in the county." The owners, as well as all West Point, are to be congratulated on the improvement in depth of this mine, and it will no doubt encourage others to further develop their mines. A 200 foot shoot on a seven-foot vein of \$50 to \$125 ore is a big thing for even West Point.

Rich Gulch.

The Ilex is idle. It stands as a monument to "top-heavy" mining. The company own a vein parallel to the one on which a fortune was wasted. This parallel vein has had no work done on it, though all the miners who are familiar with the property assert that the "petered" vein was but pocket rock, while this undercropped vein is milling rock of paying quality. As the company has 40 stamps hanging idle, it could soon, with the balance of capital remaining on hand, prove the value of this vein, and in all probability bring success out of a big disastrous failure.

Mokelumne Hill.

Mr. T. A. Goodwin, who can discount Bill Nye and beat him, is in charge as superintendent of the Quaker City mine. The mine is 1½ miles southeast of the old Gwin mine and is on the mother lode. The old shaft was put down 400 feet on a four-foot vein of \$7 rock. At present the mine is in course of development, with a Huntington mill in prospect.

The Starlight Con. M. Co.

Mr. Geo. R. Tuttle, the principal owner, is in charge as superintendent and manager. The mine is situated on the west side of Chili Gulch, three miles east of Mokelumne Hill, and contains 180 acres. It is a drift mine located on the old Chili Gulch channels and supposed to cover the junction of the Chili Gulch and Stockton Hill channels. The channel runs N. W. and S. E. and parallels the mother lode, which is but a half-mile distant. The shaft is down 195 feet to bedrock, with drift run 40 feet west, and it is estimated that it will have to go 200 feet to reach the rim. The east drift is now connected with the old workings and shows the width east from the shaft to be 215 feet. Should the gravel hold 200 feet west, this will give 400 feet in width of cement gravel that pays \$2 to \$3 a ton for from 8 to 12 feet above bedrock. The bedrock is a blue-black slate, while the cement is of the same color filled with a quartz boulder wash.

Mr. Tuttle intends running up the center of the channel 1200 feet to the end of the property, driving cross-drifts, and when the end is reached, drifting out and back-filling with the waste hewlers. A three-stamp double-discharge mill is in course of erection. This is intended to handle the cement extracted and thus prospect the cement. Once the mine is developed, it will be equipped with a mill equal to the mine's output. The millsite has an excellent dump and 275 feet fall from the ditch for water-power. The cement body is almost inexhaustible, the situation all that could be desired, and the extent of the dividends only limited to the difference between the working expenses and the proven value of this immense reserve of cement.

The old channels that cross the county in every direction, capped with basaltic lava and lava ash, are destined to prove equal in extent and value with the old gulch diggings of the days of '49, and Calaveras, in consequence, take the same position she once enjoyed as a producer of the noble metal.

E. H. SCHAEFFLE.

The Tuna.
[Written for the Press by G. R. ORCUTT.]

Probably no class of plants is more greatly admired or more thoroughly detested than the *Cactaceae*—admired for their oddity, for their beauty of form, for their lovely flowers and for their luscious fruit, the cacti are detested to almost an equal extent by the average cattleman, who regards them as a useless lumberer of the ground.

The flattened oval or elliptical stems of the *tuna*, abundantly armed with a formidable array of spines, is the type of one of the most millar forms of cactus, and perhaps better known to English-speaking races as Indian figs or prickly pears.

Among the numerous known forms of *Opuntia* there are several species which are very generally known to the Mexicans by the name of *tuna*. *O. tuna* and *O. ficus-indica* are the two species which this name is more frequently applied, at the common wild varieties or species of stemmed *Opuntia* are very generally included without distinction.

These cacti are very widely utilized in Mexico and in portions of the United States along the Mexican border in a countless number of ways. The cattleman, after horning the spines from the tender, succulent joints, will feed them to his stock with profitable results; or, in treeless region, he will plant them as hedges round his corral or cultivated fields, thus utilizing what in the previous case he destroys—the plant's natural defense against total extermination.

Growing in dry, sandy or rocky soil, they thrive where scarce any other vegetation can exist. Planted around the Californian Mission, the most fertile spots, they attain a most luxuriant growth. There, they are naturally adapted not only to thrive in sterile districts and to prepare the barren soil for other classes of vegetation, but they are equally at home under the most advanced stages of cultivation. The *Cactaceae* are without exception, I believe,

tuna. This famous species, so well known as a hedge plant in Mexico and the West Indies, abounds on every high, sandy beach from Tampa Bay around to Miami, and, perhaps, still farther north on the east coast. It quite often grows in impenetrable masses, four or five feet high, and is characterized by large oval joints, six or eight inches long. It is covered with two sets of spines, some small and chaff-like, but whose close acquaintance is not to be courted, and others an inch or more long, as sharp and strong as needles, and quite as formidable as any cactus we have seen. The yellow flowers almost invariably have a rosy tinge, and the plant is beautiful, both when in bloom and when covered with the large, rich, purple berries or prickly pears.

"Beside its use in tropical America as a hedge plant, it is used as one of the principal cochineal plants. It is quite hardy and will stand several degrees of frost unharmed. The fruit,

known as 'Indian figs' in the West Indies, and stray specimens occasionally find their way into the New York markets from some West Indian vessel."

In *Garden and Forest* I have called attention to a note to the possibility that the manufacture of syrup from the fruit of the *Opuntia* may at no far distant day become an important industry in Southern California. The juice of the fruit which these plants produce in great abundance, may be extracted in a cider press like the juice from apples, and boiled down to a fruity syrup indistinguishable in flavor from that manufactured from the watermelon. Excellent vinegar or wine may also be made from the juice. Three varieties or more are found naturalized around the California Missions, called the *tuna*, *tuna colorado* (red tuna), and *tuna manse* (tame tuna) respectively by the inhabitants of Mexico. They are extensively cultivated in Mexico for their fruits, and a great variety of forms occur in that, their native country. Dr. Edward Palmer, a noted horticultural explorer, has contributed an interesting article on *Opuntia* fruit as an article of food to the *West American Scientist* (VI 67), which has been widely quoted and is reprinted in the

broad-spreading plant, with a cylindrical, woody, thick stem when old (up to 45 cm. long and 30 cm. broad in size), green, thick (2½ in.), thinner on the edge, elliptical, with small reddish leaves; areolae regularly distributed, sunken, thornless or rarely covered with a few single, small, bristly, white spines. Flowers large, brimstone yellow. Fruit very large and edible. Grown in large quantities in Sicily for its delicious fruit. Four varieties, with yellowish, blood-red, whitish and reddish fruit respectively, the two latter considered the best."

The *tuna colorado* naturalized at the old Mission of San Diego, which I take to be a type of *O. ficus indica*, produces a rather luscious fruit, not very sweet, mealy, closely resembling in taste and flavor a frozen apple. The color is a crimson lake inside and out, the epidermis slightly dotted by a glaucous bluish. Seeds numerous, over 200, easily separated from the pulp. The fruit is ovate, 3½ inches long, 2½ inches in diameter, smooth, with over 60 areolae of fine spines distributed over its surface, a fourth bordering the deep-brownish umbilical which is an inch across. Spines usually few, short and weak; whitish, often entirely absent.

OPUNTIA TUNA—Linn.

"A native of Mexico and Columbia. Tall, broad-spreading plant, large, rather long (10 to 20 cm.) ovate or elliptical stems, the edges curving, with pointed green leaves seven mm. long. Covered with hooches of spines growing close together at base of stems, and wider apart at top, like gray felt in color, the upper spines brownish-yellow, underneath four to six stiff, hook-like, light yellow spines of unequal length (9 to 21 cm.) Petals the shape of rose leaves, mucronate; stamens yellow; stigma five-lobed; green."—Forester's Cactaceae.

The *tuna* which I take to be this species bears a very juicy, sweet, delicious fruit, yellowish-green when mature, nearly three inches long and two inches in diameter, with fewer seeds (about 150). The greenish white, firm pulp is very cool and refreshing, from which the seeds do not readily separate as in the *tuna colorado*. The slightly glaucous epidermis of the fruit is similarly armed with an equal number of areolae of fine, short spines, very disagreeable, but easily disposed of by an expert—though dangerous to a novice if he should stand too windward while harvesting them off the fruit, when they are liable to blow into the eyes with disastrous results. The average Mexican or In-

ever, indigenous to the American continent and the adjacent islands, but the *tunas* in numerous varieties have become extensively naturalized and are also cultivated with considerable profit in the south of Europe. In Sicily, *Opuntia vulgaris* is said to thrive in volcanic districts, which would otherwise be barren of vegetation.

The Mexican names *nopal* and *tuna* refer to the same species of plants, but *nopal* refers to the leaf-like stem, while *tuna* refers to the fruit. From being used to indicate a part only of the plant they had come to be generally applied to the whole.

The *tunas*, naturalized around the Missions of southern California, were brought from Mexico by the Spanish padres, who trained them into edgeward around the Mission gardens and buildings. They grow from 10 to 15 feet high, producing an abundance of a large, well-flavored, edible fruit.

P. W. Reasoner, in the *American Gardenist* (532), in writing of "native Florida cactaceae," gives the following interesting account of the occurrence of two species of *tunas* in that State:

"Next, and of more importance, is *Opuntia*

covered with occasional tufts of small chaff-like prickles, are two or three inches long, somewhat pear-shaped and pumpkin-colored. They are produced in the greatest profusion. We know of an array of glasses of marmalade, and jars of the richest wine-colored sweet-pickles, made from the fruit, and as tempting as an epicure could wish.
